## OPINIONS OF THE PRESS.

"The FAMILY DOCTOR is one of those eminently practical and useful works which may be recommended as safe and useful in all households."—*People*.

"The FAMILY DOCTOR becomes a reference book of far more than ordinary value and importance, and is stored with useful hints for the preservation of health."—*Daily Chronicle*.

"A popular periodical, and contains many useful notes."—*Morning Post*.

"A practical household periodical, both useful and interesting."—*Globe*.

"The FAMILY DOCTOR contains useful hints on medical subjects."—*Sunday Times*.

"Excellentlly illustrated with portraits of medical men."—*Echo*.

"Gives a mass of useful and quite safe information about domestic hygiene, sick nursing, &c. It ought to have a very wide circulation."—*Weekly Despatch*.

"The FAMILY DOCTOR is carefully edited and clearly printed, and meets a wants that has been long felt."—*News of the World*.

"The FAMILY DOCTOR.—Its success is thoroughly well deserved; it combines an unusual variety of hints on general medical subjects."—*Lloyds*.

"Issued in weekly numbers, and conveys to its readers much useful information."—*The Graphic*.

"A good deal of useful information is to be gathered from the FAMILY DOCTOR."—*Standard*.

"A most welcome publication, containing a vast amount of really practical information."—*Reynolds*.

"The contents are varied and useful, with an entire absence of Quackery."—*Observer*.

"A capital work of reference, and will be found of great use in every household."—*Sportsman*.

"A wonderful comprehensive collection of useful information."—*Weekly Times and Echo*.

"The contents are not only instructive, but very entertaining."—*Judy*.

"Showing in a striking manner the terrible evils of tight-lacing."—*Mark Lane Express*.

"Simple prescriptions and good advice on all subjects relating to health."—*Literary World*.

"This is just the very journal that has long been wanted, and is sure to prove a triumphant success."—*Metropolitan*.

"The FAMILY DOCTOR is so skilled that everyone will want to have him, and he will have a large practice."—*Fun*.

"Truly an astonishing pennyworth."—*Knowledge*.

"A useful and practical household periodical."—*Public Opinion*.

"The FAMILY DOCTOR, judging by the face of it, will prove a good and profitable venture; it contains a vast amount of useful information."—*County Gentleman*.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scurfs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

**THOUSANDS OF TESTIMONIALS**  
**FROM ALL PARTS OF THE WORLD.**

## AND PEOPLE'S MEDICAL ADVISER.

No. 444.—VOL. XVIII. SATURDAY, SEPTEMBER 2, 1893.

PRICE ONE PENNY.

### ANATOMY AND PHYSIOLOGY.

"We are fearfully and wonderfully made."

*See Engraving showing the Figure of a Man stripped of integument and exposing the entire external muscular system—superficial muscles removed on left-hand side to expose deep layers.*

WE are now entering upon a lesson in dissecting, and as the removal of the skin, or integument as it is called, is necessary before we can begin to examine the beauty that lies under it, we have given a drawing of a man so prepared.

On the right hand the superficial muscles of the front view are exposed, and on the left the superficial muscles have been removed to expose the deeper layers.

Let us take a cursory view of the right side, and observe the wonderful arrangement of the muscular system as displayed therein.

For a muscle to work, it must have two fixed points, as they are termed, which they draw nearer to one another by contraction, forming a series of mechanical levers. This would, of course, give a direct motion, and in the case of bending, the joints would draw one upon the other. But we require something beyond direct motion—we want to turn and twist the arm or leg about in a variety of ways, and so we get muscles taking indirect directions as it were, and twisting round in various ways to afford the requisite movement that adds so much to the usefulness of this limbs.

This direct and rotatory as well as lateral action, is all very well in its way, but if we bend our arms or legs we generally want to straighten them again some other time or another, and so we have a series of oppos-

ing muscles, or muscles acting in opposite directions, under the absolute control of the will.

When we bend the arm at the elbow, let us say for sake of example, the act is opposed by some very powerful muscles at the back of the arm; but as the front muscles are being commanded by the will, the back muscles yield, and allow the arm to bend, whilst they give elasticity to the action, and steady its movement. The arm does not fly forward and shut up like a pair of castanets, but it comes slowly and softly under conduct of the opposing muscles.

Reverse the influence of the will and let it command the back or extensor muscles, and the front give way.

The rotation of the fore-arm is performed by a diagonal muscle seen near the elbow, and the leg is lifted into the position of sitting cross-legged, like a tailor by that long thin band that proceeds from the point of the haunch bone to the inside of the knee.

The long tendons of the muscles are usually disconnected, or run in separate sheaths, as in the hand and foot, and are bound down to the bones by powerful ligaments; and the ends of bones are held together by a similar tie.

Besides the superficial muscles which to all appearances are quite strong enough to move a very much larger mass than a man, there is a subsidiary deep layer, and even a deeper below that.

The dissection of the left-hand side gives a view of some of them, but not by any means of all. The bones are exposed in some places, so that the direction of this and the superficial layer may, by comparison, be better understood.

A great deal of the power of a muscle depends upon the extent of its insertion—see the triangular fascia, as it is called, of the palm—how it communicates with the joints and forms a huge leverage for the small muscle inserted into it to act upon.

But all these matters will have to be dealt with in detail.

## EDITORIALS.

**THE FEET.**—The nails of the feet should always receive similar attention to that bestowed on the finger nails, and it will save much pain and discomfort if this fact is remembered while the feet are growing. Too often, as they are always "out of sight" in their usual coverings, they are "out of mind," until unpleasant reminders in the form of ingrowing nails, which are most painful, corns, and tenderness of the sole of the feet, demand attention. It is certainly as necessary to pay periodical visits to a chiropodist as it is to a manicure.

**SIGNIFICANCE OF INFREQUENT PULSE.**—Certain it is that slow heart occurs usually as a symptom of organic disease, whether this be confined to the heart and its arteries or to the brain. A slight reduction in the frequency of the pulse is very common in disturbances of the digestive tract. Particularly is this the case in dilatation of the stomach.

**TOMATOES AS A FOOD.**—Tomatoes are very succulent, they have a harsh tart flavour due chiefly to the malic acid they contain, says the *Horticultural Times*. When you eat a great many they produce a rather acrid and burning sensation; but this flavour is much modified by climate. In Italy they are gathered often before maturity for eating in salads, like cucumbers. They are also eaten cooked and seasoned in various ways; the most common preparation in this country is cutting them into two, stuffing with bread crumbs, seasoning, and cooking in oven; this is what they call "Tomatoes with crumbs." The tomato is a valuable aliment and seasoning, in the south of France it is eaten with almost everything. The gastronomic art has turned it to good account, and in certain forms the love apple constitutes a regular feast. But not only is it pleasing to taste, it is also a very healthy, refreshing, nutritious aliment, very suitable to bilious sanguine temperaments, for costive, irritable temperaments subject to hemorrhoidal congestions and sluggish intestines. Tomato potages are cooling and laxative; tomato broths are excellent during great heat.

TO TOBACCONISTS (commencing).—Illust. Guide, 259 pages, "Post Free." How to Commence. £20 to £1000. Tobaccoist's Outfitting Co., 186, Euston Rd., London. Manager, Hy. Myers. Est. 1866. Smoke "Pick-Me-Up Cigarettes."

MASSAGE calls into play each and every function of the body—respiration, digestion, combustion, circulation, nutrition, and elimination, doing for the body artificially what Nature does for it, and Nature shows her gratitude for the assistance rendered, by quickly resuming the work herself. It stimulates an enervated body or soothes an irritable one, cools a fever or arouses a warmth, destroys a lethargic state or induces sleep, makes pliable a rigid joint or stiffens and strengthens a relaxed one, removes obesity or makes flesh, and so on, many apparent contradictions, the explanation of which is, that the result depends on the manner of administration, each and every movement being given with a purpose, under a systematic method and the final result achieved is the normal standard belonging to health.

**HEALTH AND BEAUTY.**—The secret of beauty is health. Those who desire to be beautiful should do all they can to restore their health if they have lost it, or to keep it if they have it still. No one can lay down specific rules for other people in these matters. The work which one may do, the rest he must take, his baths, his diet, his exercise, are matters of individual consideration, but they must be carefully thought of and never neglected. As a rule, when a person feels well he looks well, and when he looks ill he feels ill. There are times when one can guess, without looking in the glass, that the eyes are dull and the skin is mottled. This is not a case for something in a pretty bottle from the perfumer's, or for a lotion that advertisements praise so highly. To have a fresh complexion and bright eyes, even to have white hands and a graceful figure, you must be well. Health and the happiness which comes with it are the true secrets of beauty.

**DID YOU REST WELL LAST NIGHT?**—In the tropics men sleep in hammocks or upon mats of grass. The East Indian unrolls his light portable charpoy or mattress, which in the morning is again rolled together and carried away. The Japanese lie upon matting with a stiff, uncomfortable wooden neck-rest. The Chinese use low bedsteads, often elaborately carved, and supporting only mats or coverlets. A peculiarity of the German bed is its shortness; besides that it frequently consists in part of a large down pillow or upper mattress, which spreads over the person, and usually answers the purpose of all the other ordinary bed-clothing combined. In England, the old four-posted bedstead is still the pride of the nation, but the iron or brass bedstead is fast becoming universal. The English beds are the largest in the world. The ancient Greeks and Romans had their beds supported on frames, but not flat like ours. The Egyptians had a couch of a peculiar shape, more like an old-fashioned easy chair with hollow back and seat.

**DISINFECTION BY HEAT.**—In the journal of the American Medical Association emphasis is given to the ready means of disinfecting excreta in the sick room, or its vicinity, by the application of heat. Exact experiments show that the thermal death point of the following pathogenic bacteria and of the kinds of virus mentioned is below 140 deg. F., viz.: *Spirillum of cholera*, *bacillus anthrax*, *bacillus of typhoid fever*, *bacillus of diphtheria*, *bacillus of glanders*, *diplococcus of pneumonia*, *streptococcus of erysipelas*, *staphylococci of pus*, *vaccine virus*, *sheep pox virus*, *hydrophobia virus*; ten minutes' exposure to the temperature mentioned may, it is found, be relied upon for the disinfection of material containing any of these pathogenic organisms, excepting the *anthrax bacillus* when in the stage of spore formation. The use, therefore, of boiling water in the proportion of three or four parts to one part of the material to be disinfected is recommended for such material; or better still, a ten per cent. solution of sulphate of iron or chloride of zinc, at the boiling point, may be used in the same way, three to one; this, in fact, having a higher boiling point than water, and serving at the same time as a deodorant.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

**DELICACY IN TASTE.**—The Chinese are well-known to possess great delicacy of taste, especially in regard to their favourite beverage, tea. Few would be inclined, however, to give them credit for such sensitiveness of palate as was recently described by a Chinese lecturer on tea-drinking, who said that when he was a boy about eleven years old, he lived with his father, who was a little near-sighted, in a cottage in the southern part of China. One day he was cleaning out his father's teakettle, and could not get all the tea-leaves out, so he put his hand in the kettle. About a half-hour afterward his father called for his tea, which the speaker took to him and returned to work. Shortly, the old gentleman called him again, and asked him if he did not tell him never to put his hand in the teakettle. "Well," said the speaker, "I did not know whether my father was peeping through the keyhole, watching me or not. So I let three weeks pass, when I knew my father was out on business, and I again put my hand in the teakettle. That evening I was called to answer the question which was asked me several weeks before. But you can rest assured from that time to this I have never put my hand in my teakettle."

**POISON IN RUBBER RINGS.**—Analyses have been made by W. Reuss of the rubber rings employed in the make-up of vessels used for containing some of the popular preserved foods. In this list, indiarubber rings made in Paris and extensively used, its average weight 0.5 grm., showed 66.6 per cent. ash, consisting almost wholly of red lead, with no antimony sulphide present. Again, an experiment was made by exposing a rubber ring to water under pressure at a temperature of 110 to 112 deg. C., for thirty minutes, at the end of which time the ring was found to be softened, and 0.0286 grm. red lead was suspended in the water, which contained no lead in solution. In the case of another ring, similarly treated in the presence of 0.5 kilo. of asparagus, the solution gave an immediate precipitate of lead sulphate on the addition of sulphuric acid, the quantity of lead in solution corresponding to sixty per cent. of the total amount in the ring. Indiarubber rings taken from tins of Australian meat from a large English firm had the same composition as the Paris rings, and red rubber rings from Vienna contained sixty-three per cent. of ash, the bulk of which was red lead.

## A NIGHT PIECE.

The sky is overcast  
 With a continuous cloud of texture close,  
 Heavy and wan, all whitened by the moon,  
 Which through that veil is indistinctly seen—  
 A dull, contracted circle, yielding light  
 So feebly spread, that not a shadow falls,  
 Chequering the ground—from rock, plant, tree,  
 or tower,  
 At length, a pleasant, instantaneous gleam  
 Startles the pensive traveller, while he treads  
 His lonesome path, with unobserving eye  
 Bent earthwards; he looks up—the clouds are split  
 Asunder,—and above his head he sees  
 The clear moon, and the glory of the heavens.  
 There, in a black-blue vault, she sails along,  
 Followed by multitudes of stars, that, small  
 And sharp, and bright, along the dark abyss  
 Drive as she drives; how fast they wheel away,  
 Yet vanish not! The wind is in the tree,  
 But they are silent;—still they roll along,  
 Immeasurably distant; and the vault  
 Built round by those white clouds—enormous  
 clouds—  
 Still deepens its unfathomable depth.  
 At length the vision closes; and the mind,  
 Not undisturbed by the delight it feels,  
 Which slowly settles into peaceful calm,  
 Is left to muse upon the solemn scene.

—W. Wordsworth.

**KEATING'S POWDER.**—Kills bugs, fleas, moths, beetles, and all insects (perfectly untrivalled). Harmless to everything but insects. Sold in Tins, 6d. and 1s.  
**WORMS IN CHILDREN.**—Are easily, surely, and with perfect safety got rid of by using KEATING'S WORM TABLETS. Tin 1s. 1d. Free by post 13 stamps.

# WHAT TO EAT AND WHAT TO AVOID.

## NUTRITIVE VALUE OF FOODS.

[SPECIAL ARTICLE.]

FOOD is nutritious according to the proportion of nitrogen and carbon which it contains. One part of nitrogen to sixteen of carbon may be considered as approximately perfect. In most foods, however, the relative proportion of these elements is not in accordance with this standard, and unless intelligent selection is made, a deficiency or surplussage of one or the other will exist. In calculating the amount of different foods to be taken, the best method is to refer to tables giving the proportion of nitrogen and carbon in the various articles. The ratio of nitrogen to carbon should be as one to sixteen, which is different from that of nitrogenous to carbonaceous material. This discrepancy is explained by the fact that all nitrogenous organised matter contains a proportion of carbon, and so, calculating on the basis of organised nitrogenous matter, the proportion of material needed to furnish the three hundred grains of nitrogen and forty-eight hundred grains of carbon required, would not be the same as the proportion of pure nitrogen and carbon to each other.

The best authorities give the necessary amounts of nitrogen and carbon to maintain the average man in health, in the average conditions of life, as 300 grains of nitrogen, and 4800 of carbon every twenty-four hours. Tables can now be studied to advantage giving the proportions of these elements in various food materials, and from them can be obtained their true nutritive value.

Table from Payen, showing the quantity of nitrogen and carbon in 100 parts of various alimentary articles. Under the head of carbon is included not only this element, but likewise its equivalent of hydrogen existing in the compound in excess of what is necessary to form water with the oxygen present. (Multiplying the figures representing the nitrogen by 6.5 gives the equivalent amount of nitrogenous matter.)

In studying these tables, several practical deductions may be drawn. (1) It is seen that man is not necessarily limited to a small variety of foods in order to obtain the best results, provided he will make a wise selection. (2) That with respect to the true relative proportion of nitrogen and carbon, the cereals and vegetables present materials much more in accord with the right standard than the flesh foods. (3) That wheat, milk, buckwheat, and rice more nearly approach the normal standard than other foods mentioned.

Shall man select his food entirely from the vegetable kingdom, or live on a mixed diet derived from the animal and vegetable kingdom? This in the minds of many is an interesting and important question. So far as the constituent elements needed to nutrify the body in the best manner are concerned, they exist in materials from both kingdoms, with chemical identity, hence, life can be supported by either.

The argument against the use of flesh meats is in brief: Is it right or wise to take life unnecessarily in order to secure certain kinds of food? This question every one must answer for himself, as it is ethical rather than scientific. Undoubtedly, food from the animal kingdom is less likely to be free from deleterious substances than that derived from the vegetable. The manner in which cattle, sheep, hogs, calves, and poultry, are reared, killed, and brought to market, or brought to market and killed, entails greater risk of diseased products than in the use of cereals, vegetables, and fruits.

The statement has been repeatedly made by physiologists and physicians, recognised as scientific authorities, that certain liabilities to disease and contamination, if not actual poisoning, attach to the use of animal flesh as food. In plant life, under favourable conditions, no change occurs for a considerable period of time after maturity. On the contrary, in the animal kingdom, the moment life begins, death also invades the field, and imitates the processes of dissimulation, nerve, muscle, bone, and blood, breaking down into waste, poisonous material, which, if not removed from the body,

would in a short time cause disease, and finally the death of the animal. These products are not only poisonous to the animal when accumulated in the system, but they are poisonous substances in a degree to other animals if introduced into their systems. They exist in form of urea, creatinine, &c., in the partly broken down tissues of the animal, in the lymph, or juice of the flesh, and in the blood. The special fact to be borne in mind is that these substances are found in all flesh, that they are not nutritious, nor in any sense a part of the nitrogenous or non-nitrogenous elements of nutrition furnished by the animal but that they are simply foreign, waste, and excrementitious in character.

The effect of these substances taken with food is to heighten the circulation unnaturally, and excite the nervous system, and it is to these innutritious products that meat owes its stimulating quality. The consequences of excessive meat eating are often clearly observed in certain functional disturbances of the nervous system, and organs of excretion, and also in mental and moral characteristics. The same argument does not hold good in cases of animal products as milk, cream, butter, and eggs.

An erroneous impression has existed, and still obtains with many who are not aware of the facts in the case, that unless meats constitute a generous part of the daily bill of fare, no strength can be gained for working purposes. The particular office of nitrogenous foods is to build up the framework of the body, and maintain its structural integrity, but it is mainly the non-nitrogenous compounds, the starches, sugars, and fats that furnish material for heat and force, and that stand for its working power.

## CONSUMPTION.

MANY of the most important and vital organs of the human body cannot be reached by medicines in a solid, or even in a liquid form. Thus the lungs are shut up in a bony chest, to which access can only be had through the windpipe, the opening of which is closed up by a valve called the epiglottis, so sensitive and so delicately constructed that it will not allow the passage (except by main force) of the most minute crumb, or the smallest drop of liquid.

Every person who has swallowed the "wrong way" the smallest substance, whether liquid or solid, know the feeling of strangulation produced thereby. A man cannot, if he would, voluntarily swallow any liquid or solid into the lungs, or the passage leading to them. Therein lies the true reason why consumption is so often incurable. The classes of diseases known by the name of consumption are essentially of two kinds. One consists of the formation of tubercles—that is ulcers in the body of the lungs—the other is that of inflammation of the lungs, or the passages leading to them. If we could reach these organs directly by medicinal applications, there is no reason why ulceration and inflammations of these organs might not be as easily cured as those of the head or face.

Now, no medicines when swallowed go near the lungs, they pass down the gullet into the stomach. To take pills, &c., with the view of curing consumption is as absurd as to take them to cure a boil on the arm or an inflammation of the eye. Indirectly, proper medicines are aids, and great aids, in assisting to cure these complaints by benefiting the general health and tone of the system, and by enabling it to throw off this insidious disease. The lungs themselves can only be touched in an aeriform, or spiritualised, form, or by the inhalation of suitable drugs, &c.

The above remarks are not made to discourage the afflicted with this baneful disease—that medicine is no use—as before stated, it is (that is, proper medicine), of great use as an aid. Those remarks were chiefly made to guard the inexperienced against the many shameful and barefaced impostures practised by empirics of almost every grade in the present day.

Great care in clothing, guarding against the sudden changes of the atmosphere, strengthening diet, combined by early and skilful medical treatment, are the only safeguards against this, what may be truly and justly called the bane of England.

## CARE OF THE TEETH.

THE most superficial knowledge of hygienic laws will teach the necessity of providing for the future of the child through a proper course of diet. The teeth are but indications of the constitutional vigour of the child; if he be weak and subject to disease, the teeth will be pretty sure to show at an early age the lack of proper nutrition, and general strength will give its corresponding result. It is hardly possible to make pure milk too much an article of food for children—but purity is a very important consideration. In connection with milk, as the child advances in age, plain, nutritious food should be used, and that which is difficult of digestion or has little nutriment should be avoided. Many a digestion is spoiled, and the seeds of life-long misery laid, by the pampering of the child with articles wholly unsuited to its delicate stomach, and which, were it possible to digest them, would add little to the growing youthful tissue. If the mother is in doubt as to what may properly be used as food for her child, let her consult some standard work on hygiene, or her family physician, and watch carefully the welfare of her darling. The elements of strength and soundness of teeth and bone must be supplied through the food.

Reference has already been made to the possibility of nervous derangements, the cause for which could not be satisfactorily explained, arising from affections of the mouth and teeth. These may not only occur from difficult dentition, but are quite as likely to arise from some affection of the tooth pulp, which possibly may give no outward sign of its existence, and which none but a medical attendant may be able to locate. Nervous sympathy is too deep and intricate a question for treatment in the limits of a brief paper, but its possibilities should be borne in mind when an adequate reason for inexplicable disturbances of the system cannot be discovered.

There are numerous irregularities of the teeth which are more or less annoying, in proportion to the prominence with which they force themselves upon the attention of one's friends, or interfere with the proper use of the teeth, but which it is impossible to correct or prevent. There are others which are the result of habit, and may be prevented by care at the proper time. A steady pressure against the immature teeth, such as may result from continued sucking of a thumb or finger, or even a bottle-rubber or a "sugar-teat," which mothers occasionally give their children to keep them quiet, may press the incisors of either jaw outward, so that it becomes almost or entirely impossible to close the lips over them. After the mouth has become firm, and the position of the teeth permanently fixed, there is no cure for this ever-present reminder of an infantile habit, which a little forethought and care could easily have broken up.

An eminent medical authority, treating of the subject of deformities of the teeth and mouth, ascribes much of it to the precocious forcing of the mental traits, while yet the whole strength of the organisation should be devoted to the perfection of the physical structure. During the first seven years, he claims with admirable logic, the brain and nervous system, instead of being forced, should be carefully guarded, and their development rather retarded than stimulated. "Outdoor life, childish pursuits, plain and wholesome food, long periods of repose"—these are his lines of employment for the childish energies.

One of the most common affections of the teeth is tartar, a deposit which comes from the saliva and the various impurities with which it is mingled, forming an adherent crust which may be almost flint-like in hardness, or so soft that it may easily be removed with a finger-nail; the colour, also, may vary from black to white, through nearly all gradations. Where, as often happens, the formation insinuates itself between the gums and the teeth, it may work irreparable mischief, and whenever a deposit is noticed, it should have prompt attention at the hands of the dentist—not only for its removal, but for the correction, if possible, of the cause.

It cannot be too strongly impressed that any

diseased condition of the teeth should at once have treatment, and this for a variety of reasons, not all of which receive the attention that is their due. It is not only necessary in order to prevent more extended ravages, but the general health must unavoidably suffer. The breath of a person with diseased teeth is often so offensive as to sicken those who chance to inhale it, and, of course, correspondingly mortifying to the sufferer. But this is not all, nor the worst. The offensive particles which render expirations so offensive, must inevitably be carried to the lungs, where their effect will as inevitably be felt sooner or later; and mingled with the food and drink, they go to the stomach, whence their rank poison, absorbed into the circulation, permeates the system with deadly influence. How important, then, that cleanliness and constant care of the mouth and teeth should be exercised as a preventive of more serious disorders of the general system.

There are many ways in which injury may be done to the teeth through careless habits. The constant embrace of a pipe-stem (though our lady readers are, fortunately, not smokers of clay pipes) will wear away the teeth to their ruin, while the excessive use of vinegar or other acids will destroy the enamel. Whenever the teeth are "set on edge" by anything taken into the mouth, it is simply the nervous intelligence that the enamel has been attacked, and by so much weakened; and it is well to bear in mind, also, that every injury to the enamel is an injury for all time, since the nutrition of this flinty coating is insufficient to repair any accident or waste.

There can be no doubt that one of the best means for the development and perfection of the teeth consists in the use of such food as requires thorough mastication—in fact the adequate use of the teeth in this way yields a double benefit, since not only is the food fitted for the digestive fluids of the stomach, thus saving from the miseries of indigestion and kindred evils, but the teeth themselves are kept clean and pure by the labour which they perform, and are strengthened in a double measure—through their own activity and from the adaptation of the food to furnish the material of which the bones and teeth are formed.

## NURSING THE SICK.

By SISTER MARY.

WHEN patients leave their beds for the first time it is often advisable to lift or carry them to a sofa or couch, rather than allow them to walk; and this often requires some little ingenuity on the part of the attendants.

Having spread out a thick blanket over the couch conveniently for enveloping the patient without delay, the couch or sofa should be placed with its head close up to the foot of the bed, so that those who are lifting will not have to wheel round with their load, but by moving a few paces to the left or right, as the situation may require, the patient can be borne feet foremost, and deposited in the desired position.

Sometimes a patient may be, from paralysis, prostration, or any other cause, quite unable to help himself in any way, in which case three persons will be required to move him, and should arrange themselves as follows:—One on each side of the bed; that is, if the bed be not too wide, and has not footboard, in such case the bearers will have to take up their position both on the same side of the bed, and on the side nearest the sofa. Where everything is convenient for them to stand one on each side, they should clasp hands; one pair passing round the back, just below the shoulder-blades of the patient, and the other pair under the upper part of the thighs. When both are obliged to be on the same side the one bearer passes his arms under the shoulders, and under the small of the back, the second bearer places one arm under the lower part of the back, and the other arm under the knees; and both shall lift together at a given signal, that the patient shall also understand, the words, "one, two, three—away," being generally sufficient. The third attendant will steady the head, or an injured limb, if there be one, during the transit.

When one bearer can be considered sufficiently strong to lift and carry the patient, as may be the case with children or emaciated subjects, she must pass her arms well under the patient, one below the shoulder-blades, and the other under the two knees, and lift steadily and carry cautiously, not in bangs or jerks.

Sometimes it is necessary to keep the patient perfectly straight and recumbent, as in the case of a broken thigh. The better plan then is to get two long poles, or long broom handles might do, and lay one at each side of the bed, rolling the under sheet and blanket firmly round them. Then four bearers, two at each side, grasp the ends of the poles with one hand each and the centres of the poles with the other. Thus arranged, the patient may be lifted as on a stretcher, and carried to the sofa or couch prepared for him with comfort to himself, ease to the attendants, and safety to the limb.

Perhaps the patient may be strong enough, and otherwise able, to assume a sitting posture and yet quite unfit to walk. In that case he may be lifted and carried by two nurses in the manner known to schoolboys as the "sedan chair." This is arranged by each bearer grasping firmly the wrist of the right arm by the left hand, the backs of both hands being uppermost; passing these locked hands under, and grasping each other's left wrists with the right hands, a square seat is formed, of great power for the purpose of lifting. The patient may then place an arm round each attendant's neck, and the carriage will be complete. The bearers must only advance one foot at a time and be careful to keep step.

The patient may be able to walk with a little assistance. This is readily given by the nurse standing at the patient's side and passing one arm behind his back, and placing her hand firmly on the opposite hip, whilst the patient rests the arm nearest to the nurse upon her shoulders, letting his hand fall forward over the further shoulder sufficiently for the nurse to grasp it firmly with her disengaged hand.

When it is necessary to turn a helpless patient on to his side for any purpose, he should be arranged perfectly straight, with an arm close at each side and the legs fully extended. The nurse then passes both arms underneath him, one in the region of the chest, the other under the hips, so that the hands are well round on the other side. By a firm pulling motion the patient will roll easily over, and the exact position may be regulated with much nicety.

A necessity for the sick-room is a *bed-pan*, and a knowledge how to use it. There are two forms in general use, one being round and the other shaped like a slipper. Either should be covered with flannel, drawn round the edges by means of a piece of tape strung through the hem of the flannel, and tied to the required dimensions, so that the pan is covered without overlapping into its chamber.

The round pan is applied by just lifting the lower part of the back of the patient, and placing it sufficiently far under to prevent it from tilting.

The slipping pan is applied by drawing up the knees of the patient, and passing the thin edge under the body.

After using, they should be removed from the room at once, covered, and conveyed away to be emptied, great care being taken to wash clean by rinsing, and then a little water may be left standing in it, with a dash of disinfecting fluid. This precaution should be especially observed in all cases of infection or fever, when disinfecting fluid should also be added directly to the contents. By attention to such matters as these the nurse declares herself worthy of her vocation; by the neglect of them she plainly declares her incompetence.

Sometimes nurses will keep the contents under the bed for the purpose of drawing the doctor's attention to them when he comes; but as his visits may be irregular or uncertain, such a course cannot be too strongly reprobated. In no case should such an examination, which is oftentimes necessary, take place in the patient's room.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

# ALCOHOL—ITS EFFECTS UPON OUR SOCIAL LIFE.\*

By M. L. HOLBROOK, M.D.

LADIES and gentlemen :—I am asked to give some thoughts on the relation of alcohol to our social life. It is a somewhat difficult task. Nevertheless, something can be learned from history, something from the study of biology and something from such observations as students must make in the study of sociology, a science as yet almost in its infancy.

## WHAT BIOLOGY TEACHES.

Biological studies teach us that the character of the blood influences in a remarkable manner the character of the thoughts, feelings, and impulses which are generated in the brain. If this fluid is abundant and of a normal character, a joyous feeling fills the whole being, and there is a fulness of life, whether the person is rich or poor, cultured or uncultured; the thoughts and emotions are then more likely to be pure and good rather than evil. If there are exceptions, we need not here consider them. Then work is a delight and weariness does not come from long continued toil. If, on the other hand, the blood is deficient in quantity, depraved in quality, and does not circulate properly, the most abnormal mental and moral manifestations may take place. There is then no joy in the heart, nor such fulness and richness of life as ought to be the lot of every animated being, and particularly of every human being. Work, whether physical or intellectual, drags the person down, and every weight, however small, may become a burden.

If in this case the temperament and constitutional tendencies of the person be to vice or crime these phenomena occur at least far more readily than when the tendencies and habits are good and the blood is pure. This is the teaching of experience and also would seem to be in accord with reason.

## THE BLOOD IS THE LIFE.

The same thought is practically expressed in the Bible, when it says the blood is the life, and while this is usually interpreted to mean the physical life, it might also be construed to mean the kind, and degree of moral, intellectual and spiritual life. They are all influenced by the character of the blood, and this is influenced by the character of our food and drink, as well as by the vigour of the digestive organs. It cannot be otherwise. If we consider the anatomical structure of the nerve ganglions or so-called cells that go to make up the brain, we find that a capillary carrying a stream of blood passes close to each brain or other cell, and gives to it a little of the serum containing such nutriment as has been made from the food taken. If we imagine a boat at the dock, unloading a part of its cargo, we can see in our mind's eye, readily, how a nerve cell is supplied with its pabulum, excepting that the blood does not stop at the brains cells but gives off its portion while still in motion. Now, if the blood is loaded with alcohol, some of it passes with the serum directly into and around the cells. Its effects on them, in producing mental or physical manifestations, will depend on the amount of alcohol and upon the temperament and character of the person.

## TWO KINDS OF EFFECTS OF ALCOHOL.

There are two classes of effects, one the physical effect and the other the psychical. The physical effects are paralyzing.

The psychical effects are stimulating to activity.

The psychical effects are immediately, or nearly so.

The paralyzing effects come later, and after the alcohol has had time to penetrate all the tissues of the body and exhaust their natural irritability.

The psychical effects vary with the individual. I have known a sentimental, religious man to pray powerfully under the influence of alcohol. The prayer would not be a logical one, nor altogether rational. I have known a preacher who was in poor health and low-spirited take a little whiskey just the right time before his

sermon, and think he never preached so well, I once knew a temperance lecturer who took the same means to lash into action his intellectual faculties, jaded by overwork, insufficient sleep, and unsuitable food. That our politicians and statesmen do the same thing is notorious. Alcohol also sometimes opens the heart and may make one benevolent. Business men understand this, and when not swayed by ethical sentiments, gain advantage over customers by first giving them wine. Brutus says to Cassius, "Give us the bowl of wine, and we will forget all unkindness."

## EFFECTS ON LOWER FACULTIES.

But if alcohol stimulates to activity the moral and intellectual faculties, as it does in some temperaments and conditions, it in a far larger degree excites those functions which we call lower, and especially the combative and also sensual tendencies. The reason for this is that these functions are in a majority of persons more exercised and more easily brought into activity. Their condition is one of more unstable equilibrium. There is no doubt more blood sent to the centres that produce them. The result is that fighting and brawling have ever been associated with intemperance, and wine and women associated in song. Socrates hints this when he says to Critobulus, "Suppose we desire to choose a worthy friend, one on whom we can always rely, what would be our method of procedure in this matter? Should we not beware of much addicted to high-living, to wine and women, or of a lazy disposition, since enslaved to such vices, no one can be of use to himself or to another."

## WINE AND WOMEN.

One gets practical proof of this if he travels much in France and Germany, and finds himself thrown into the society of officers of the government, or of the army, or men of wealth and idleness, who spend much of their time in saloons or wine rooms and among those of criminal habits—what does he hear among those persons whom Nature has endowed with strong bodies and for whom culture has or might have done so much? Is the conversation devoted to moral and intellectual subjects. Does philosophy, philanthropy, or science come in for a share of the conversation? Is human progress and human perfection a subject for discussion? Is even the subject of a purer and nobler politics the theme of men who ought to be earnest and honest patriots in word as well as in deed? Are spiritual themes given any thoughts? Not at all. One of the chief topics of conversation with the wine taken is woman. But is it conversation concerning woman's virtues, her heroism, her self-sacrifice, her rights as a human being, her grand mission as a mother of the human race, as an educator and conservator of all that is good and pure and noble, and as an important factor in progress in art, religion and science? Nothing of the kind. The talk may be of war, of political intrigue, but it is also largely of woman as an instrument for the gratification of man's passion. Her beauty, her physical charms, her hot blood, her passion and power to excite passion in others. In this kind of talk, European men are far worse than Americans (though to their credit be it said they do not converse on these themes before the young) and this I attribute largely to the greater consumption of wine. We shall come to it eventually if we go on as we are going. Indeed we have already done so among those who make merry over the festive bowl. It is a serious matter in Germany how this evil is to be overcome. The Emperor recognised it and his suggestions concerning the evils of beer drinking, which a year or two ago called out so much opposition among Germans, were aimed at those foul dens where drunkenness and unchastity were stalking hand in hand on the road to physical and moral degradation.

## HOW ALCOHOL AFFECTS WOMEN.

Let us now turn the tables, and see how alcohol affects woman. It affects her worse than man. Woman is naturally modest and virtuous. The tendencies of evolution are to weed out at least the worst of those who are not so. Good men love and praise these two virtues. Women who are not modest and virtuous are excluded from the society of the good. They must find associates among their own kind. Did ever a sensual woman receive the

plaudits of the noble, or the high esteem of either sex? The moment a woman ceases to live a pure life she becomes weak. There is immense strength and power in purity, purity of heart, purity of life. But alcohol takes away these virtues from women. There is an proverb, "Wine makes a woman immodest." The Talmud has a saying :—

"One cup of wine is good for a woman. Two debases her; when she has taken three she acts like a strumpet." In ancient times when women lived more out of doors and was very robust in body, one cup may not have been enough to make immodest, but in our time it often does. It is by means of wine, alas, that women too often lose their virtue. Mr. I. Wilson, overseer of St. Margaret, says :—"The women here almost, if not always, attribute their downfall to the excitement of liquor. The saloon is the mainstay of the sensualist." Women could not be kept in brothels without ardent spirits to lower their love of virtue, and to take away their will power which enables them to resist temptation. And after her fall, as one writer says, "she drowns her remorse in drink."

## PREVENT.

A great poet has said :—

"Prevent! Spare useless labour, idle breath;  
Close up the drinking dens by night and day;  
So shall you find the prize you seek is won,  
And more than half the work of mercy done.

"Contrast with this, the maiden in her prime,  
Ere sin and grief had done the work of time.  
The artist takes his theme from long ago;  
'Tis truth to-day; and it was always so:  
Lust and corruption thrives where taverns  
flourish; there  
Sin opens hell gates to the young and fair."

## THE HUMAN RACE NOT IMPROVING AS IT SHOULD.

One word more and I will close. Some of our modern writers have recently hinted that the race is not improving as fast as it might. Even Darwin, that most hopeful of men, intimated that in our age the law of natural and sexual selection has been set aside to a very great extent, and that the vicious and intemperate and incompetent are leaving more descendants than is compatible with the interests of the future. Other writers have hinted at remedies which are not only unpracticable, but some of them almost revolting. Mr. Alfred Russel Wallace has, however, put forth some suggestions which are certainly worthy of consideration. He believes the time has come when man may take a greater interest in his own improvement through what he calls "human selection," which I take it is in part, at least, to supplement natural and sexual selection. We cannot enter into his argument here, but one of his strong points is that women should decline to marry men who are intemperate, impure, and sensual, demanding that they shall be pure and strong, and that men shall act in the same way in their choice of wives. If we reason from analogy, this certainly would give us a better race of men and women in the future. We know that alcoholic drinks indulged in by either sex to any considerable extent promotes sexual excesses, and we know that it may saturate the germs which are to produce a living being, and that either of these things tends to lower not only the chances for begetting the best children, but sometimes gives them a bias to evil which is truly appalling. In view of this fact, we will not go far wrong when we insist that the future fathers and mothers of the race, if they wish, as indeed they will, to give to the world nobler sons, and more queenly daughters, shall themselves be pure, strong, and noble in the highest sense in which we can use these words.

IS BRITISH SPORT DYING OUT? has often been a question for discussion, and it is very satisfactory to know that a negative answer can be given. The physical condition of Englishmen has improved during the past half century, and the cause of this satisfactory change is attributed to the better style of living which has been adopted by all classes. Men are more temperate, both in eating and drinking, and, above all, the system is kept in tone and the blood purified by medicines of sterling worth, such as Holloway's Pills and Ointment. The taste for sport will never die while people use these remedies, which will cure or relieve any complaint, and give strength in place of weakness.

\*Read before the World's Congress for Social Purity, in Chicago.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**BOILED MACARONI.**—Break sticks of macaroni into pieces about an inch in length, sufficient to fill a large cup, put it into boiling water, and cook until tender. When done, drain thoroughly, then add a pint of milk, part cream if it can be afforded, a little salt, and one well-beaten egg; stir over the fire until it thickens, and serve hot.

**MACARONI WITH TOMATO SAUCE.**—Break a dozen sticks of macaroni into two-inch lengths, and drop into boiling milk and water, equal parts. Let it boil for an hour, or until perfectly tender. In the meantime prepare the sauce by rubbing a pint of stewed or canned tomatoes through a colander, to remove all seeds and fragments. Heat to boiling, thicken with a little flour; a tablespoonful to the pint will be about the requisite proportion. Add salt, and, if desired, a half cup of very thin sweet cream. Dish the macaroni in individual dishes and serve with a small quantity of the sauce poured over each dish.

**BREAD.**—Two quarts of entire-wheat flour (before sifting), one quart of water, one-half cupful of sugar, one-half cake of compressed yeast, a little salt. Dissolve the yeast in part of the water, stir the sugar and salt into the flour and add the yeast and remainder of the water. Stir well with a large spoon and set in a warm place. When the dough has risen to twice the original amount, stir down and put in tins for baking, allowing it to rise a second time. It requires longer and slower baking than white bread to develop the rich, nutty flavour of the grain, but no definite directions can be given, since the size of loaves differ so much. Bake a full hour or even longer if the heat is a little slow. This quantity makes two loaves of bread. In hot weather less yeast will be needed if the bread is allowed to rise over night.

**STEAK PUDDING.**—Line mould with thin suet crust. Cut three quarters of a pound of rump steak in slices. Dip them in pepper and salt, lay in a dish, filling up centre with oysters, or mushrooms, wet with good stock. Tie the dish in a cloth and boil three hours.

**ENGLISH STEW.**—Cut up three pounds of rump steak. Dissolve four ounces of beef extract in one quart of water, add beef, and stew two hours. Season with cayenne, salt, grated rind and juice of half a lemon, one tablespoonful of cornstarch wet with three tablespoonfuls of mushroom catchup, one teaspoonful each of soy and Worcestershire sauce, and one glassful of port. Stew fifteen minutes.

**STEAK BALLS.**—Broil slightly two pounds of lean steak. Chop fine; add one tablespoonful each of flour and milk, and seasoning to taste. Fry in hot fat. Serve with a sauce.

**ROLLED STEAK.**—Beat a round steak and spread with forcemeat. Roll up and tie. Put in a pan with a little water, bake tender, basting often. Thicken gravy with browned flour wet with a little water, season; add ketchup to taste. Cut string.

**SPONGE PUDDING.**—Line a basin with apricot preserve, strew the preserve thickly over with browned sponge cake crumbs. Make a custard of two well-beaten eggs to half a pint of milk, season with grated nutmeg, sweeten with refined sugar, and flavour with orange-flower water or essence of violets (ground orris root). Pour carefully in. Steam or boil for one hour, and serve with scalded cream.

**SAVOURY BREAKFAST SANDWICH.**—Pound together to a smooth paste one part of fresh butter and two parts of grated Parmesan or thinly sliced Cheshire cheese, and made mustard to taste; butter some thin slices of bread with this mixture, and lay on half of their number a thin slice of ham, smoked beef, bologna sausage, or any other cured meat. Press the rest of the cheese, spread bread on the above, cut them into neat little sandwiches and serve on a bed of mustard and cress.

## HINTS FOR THE HOUSEHOLD.

**CARE OF UMBRELLAS.**—After coming in out of the rain, let the umbrella down and stand it on the handle that it may dry in this position; the water will thus drip from the edges of the frame, and the cover dry uniformly. When placed with the handle upwards, as is frequently done, the water runs to the top of the umbrella, and the moisture is there retained in the lining underneath the ring for some length of time, causing the silk or fabric with which the frame is covered to become tender and soon rot. A silk umbrella is much injured by being left open to dry, the silk becomes stretched and stiff, and will soon split, thus cared for. When not in use let the folds lie loose, not fastened down; the creases are less apt to split from this usage.

**WINDOW CLEANING.**—To begin with, have the windows thoroughly dusted every day when the rest of the room is done—window sills, ledges, sashes and all; the gas burned in the room gives off carbon, alias smuts, so of course in winter does the fire, and this together with the dust all lodges in the window. Naturally this is specially the case in winter—a time when window cleaning is particularly inconvenient. It stands to reason that if the windows are thoroughly dusted regularly they will not require to be washed or cleaned nearly so frequently. When the cleaning is inevitable, have ready a muslin bag full of whiting and two wash leathers. Dust the glass thickly with the whiting, then rub it off thoroughly with a damp—not wet—leather, and finally polish it well with a clean, dry one. This is a method pursued by workmen when cleaning the windows of a new house, and gives a polish unknown to the glass washed in the ordinary way. Another excellent method for giving brilliancy to glass is to dampen a cloth with spirits of wine, rub the glass well with this, and then polish as before with a clean, dry leather.

**PASTE.**—For ordinary purposes, paste consists simply of flour made into a thin cream with water and boiled. It then forms a stiffish mass, which may be diluted with water so as to bring it to any required condition. It is sometimes of advantage to add a little common glue to the paste. Where paste is kept for a long time, various ingredients may be added to prevent souring and molding. A few cloves form perhaps the best preservative for small quantities; on the larger scale carbolic acid may be used; salicylic acid is also a good preservative; a few grains added to the freshly prepared paste will entirely prevent souring.

**ETHER** will take out water marks from silk. A LITTLE paraffin rubbed on screws will make them enter wood more easily.

**MADRAS** muslin or printed frilled curtains are effective bedroom draperies and are much sought after by reason of their artistic colouring.

**NERVOUS** headache may be greatly relieved by the application of hot water to the temples and the back of the neck, particularly if a hot foot bath is used at the same time.

**CARPETS.**—To remove stains from carpets employ benzine, the purest kind obtainable at the chemists, rub well into the stain with a clean linen rag, allow it to dry, and repeat the application till the stain is removed. The benzine will not injure the colour of the carpet in the least; but if very extensive stain occurs, the breadth should be taken out and sent to a cleaner.

**TRAT VEXATIOUS LAMP-WICK.**—Sometimes the lamp-wick obstinately refuses to be turned up in the ordinary manner. It will seem firmly wedged at one side, while the other one runs up in a point, causing weariness and vexation of spirit. To overcome this depravity, take a new wick, draw out a thread near the selvage, and the wick will be found quite tractable when introduced into the burner, the cogs will take it up properly, and it will appear in good form, and give an even flame when lighted.

**STRIPS** of soft filtering paper soaked in a solution of salicylic acid and worn next to the

skin after drying, are recommended for perspiring feet.

"DON'T bite your thread, it is silk," was the warning a medical man gave a young woman the other day, who, intent on her fancy work, was snipping off with her teeth the frequent ends of silk her work produced. Serious cases of lead poisoning have resulted from the practice, as silk thread is soaked in acetate of lead to increase its weight.

"TRUE AS PREACHING."—What is the use of worrying at what angle a chair stands in the room, so long as the chair is a comfortable chair? We have known a poor tired woman to walk upstairs and downstairs, and into every room in the house, simply to make sure that every shade was pulled just so far down in each window, so that it would look nice from the outside: then she was too tired to go out that afternoon. Was it worth while? Hardly. True, there some people who never so happy as when they are miserable, and are never so content as when they are finding fault. Have we not known housewives, blessed among women, who, when they cleaned, were never so wretched as when they could not get more than half a dustpanful of dirt after sweeping a room? Rip Van Winkle's wife burst a blood-vessel in scolding the pedlar who crossed the freshly sanded floor. She cared about the floor; the pedlar didn't. She died; the pedlar lived.

**TO MAKE SHOES LAST LONGER.**—In the first place, as soon as you come in from bad weather, take off your shoes and fill them with dry oats, which will quickly absorb all the moisture and prevent the leather from losing its shape. Be particularly careful not to put your shoes near the fire. The next day take out the oats, which may be dried and made to serve again. If you do not like the idea of using oats, stuff your shoes with fine paper, which answers the same purpose. Paraffin will soften leather which has been hardened by water and restore its suppleness. A mixture of cream and ink is an excellent thing to rub on ladies' fine kid boots. To keep your shoes from creaking, rub the soles with linseed oil. You may do this more thoroughly by letting the soles rest on a dish containing a little of the oil, which will be absorbed by the leather, and in addition to stopping the creaking, will make the shoes impermeable to snow and water. Another way to keep out water is to heat the soles slightly, then rub them with copal varnish and let them dry. Repeat this operation three times and you can go into the wet with impunity.

## THE GRAPE CURE.

**NOW** that the season for grapes is upon us it will be well for those who need it to give some attention to the grape cure.

An important part of the grape is its sugar, which may be as high as thirty per cent., or as low as five per cent. The warmer and drier the weather at the time of ripening, the more sugar in the grape, and the less acid it is found to contain. There is a small quantity of albuminous matter in the grape, similar to the albumen in the blood, also some gum and dextrin. The mineral constituents are tartrate of potash, soda, phosphoric acid, lime, magnesia, and iron. From seventy to eighty per cent. of the grape is water. . . . The physiological effect of the grape is significant. Eaten with other suitable food in quantities from one to two pounds daily, they increase nutrition, promote secretion and excretion, improve the action of the liver, kidneys, and bowels, and add to the health. The sugar of the grape requires no digestion, but is taken almost at once into the blood, where it renders up its force as required; so, also, of the water. . . . Eaten moderately, with a suitable diet, they will not produce cathartic effects, but a more natural action of the bowels, so important to health; or if eaten in large quantities, they are generally laxative. As soon as this occurs obstructions disappear, and a feeling of comfort arises which is very gratifying to the sufferer.

# THE MOTHER'S PAGE.

## THE ART OF SAYING "NO."

WAS sitting with a friend, a mother writes, when her twelve-year old boy sprang into the room, eager and impetuous. "Mother," he shouted, "can I go out swimming this afternoon? All the fellows are going."

The mother quietly shook her head. "I am sorry," she said, "but you cannot go." The boy did not see me in his absorption, and he straightened himself defiantly. "I must go," said he.

Instantly a look of reproof and command came into the mother's face, and she silently looked her boy in the eyes.

He softened at once. "I want to go awfully," said he.

"I know it," she answered gently, "but your father has decided that you are not a good enough swimmer to go into the water without him, and he cannot go with you this afternoon. Here is Miss B.," his mother added; "cannot you go and speak to her?"

He gathered himself together and came and shook hands with me politely, but all his bright, eager looks had vanished. He was plainly bitterly disappointed. He went and sat down in the garden for some time in silence. Finally he came in again.

"Mother," said he, "I don't believe Harry Hotchkiss can go swimming either. If I can get him, may we go over to Pelham Woods together?"

"Oh, yes," answered his mother, cordially; "and there are some nice ripe apples. You may take some for both of you."

Tom's face grew brighter; he made a plunge for his mother, and gave her a hug which disarranged her hair and crushed her neck ruffle entirely. "Mother," said he, "I do love you."

"So do I you, Tom," she answered quickly. And then Master Tom dashed out of the room. I have since watched other mothers to see what their methods of refusal were.

"No; you cannot."

"No; and don't you ask me again."

"No; and stop teasing."

"No; and do go away somewhere."

"No; and when I say no, I mean no."

These forms of refusal were common in a number of families. I heard them repeatedly, always spoken in an irritated tone; and I heard one mother say, "No; and if you ask me again I'll whip you."

How could I show that mother that she was mistaken?

I am sure that children can be taught that it is just as necessary to obey a pleasant "No" as a cross one, and it is so much easier for them when they are refused kindly. The spirit of combativeness is not aroused, and all they have to do is to bear the disappointment whatever it may be, which alone is hard enough for their eager little hearts to endure. But if they love you and trust you, and you give them as much sympathy over their trouble as you would for a cut finger, for instance, you will be surprised at the brave way in which they will resign a forbidden pleasure.

"It is easy to mind Aunt Margaret," I heard a girl of twelve say not long ago.

"She says 'No' just as pleasantly as she says 'Yes.'"

Is it not worth while for busy preoccupied mothers to thus make it "easy to mind" them as far as possible?—*Christian Globe*.

## WOMAN.

IN every known country in the world woman is looked upon from a different point of view: her status has been graphically and tersely defined by Madame de Lambert, who expresses herself thus to her compatriots:—

The one most indefinable being in the world is woman. Carry your thoughts over the

different nations of this globe and you will not find two alike in their ideas on that subject.

In Africa woman is a slave cringing under a savage master.

In India and China she is an animated machine, wound up simply to minister to the pleasure of some ugly, baboonish man.

In Turkey she is a pretty, jewelled plaything (generally bought in the market), easy to lose, and, therefore, has to be kept under lock and key.

In Spain she is somewhat of a dangerous enemy, whom it is advisable to shut up now and then.

In Russia she is a sad, miserable companion, whom it is considered good to beat from time to time.

In England she is on a submissive equality, esteemed, admired, and loved.

In Poland she commands.

In France she is adored as a divinity, and Madame Lambert winds up this definition with the remark, "French women are consequently not the most to be pitied."

\* \* \* \*

## INFANTILE CHOLERA.

PERHAPS the most important, because the most perplexing disease of summer, is that of infantile cholera.

Infants from six to twelve months are the most ready subjects, but it may occur at any age up to two years. Those fed artificially are the greater victims—heat and foods being the two great common factors in the causation of the disease.

The onset of infantile cholera is sudden, whether it occurs in the midst of health or in ordinary diarrhoea.

The stomach soon becomes intensely irritable, and everything swallowed is ejected. The appetite is lost, but there is great thirst; the tongue dry and pasty, the abdomen placid, restlessness, the breathing is irregular, and the urine suppressed. After a few hours the infant melts into a mere shadow, with pale face, pinched eyes, sunken cheeks, and eyelids only partially closed when sleeping; the muscles grow soft and flabby, extremities cold, thready pulse, drowsiness, apathy, and collapse.

In the stage of collapse, heat to the spine, or heat and cold in the form of a spray, or hot and cold sponging, gives great relief. If the patient requires stimulating, mix five drops of brandy in a tablespoonful of water, and give one teaspoonful every fifteen minutes. Send for medical aid at once; remember that there is no time to lose in waiting. The baths, drink, and enemas are what you must depend upon.

If foods and heat are the causes, the first duty is special attention to these. Children should have only what Nature has furnished in the way of food. The mother's milk, if normal, and the child kept cool, not exposed to the excessive heat or sudden effects of cold, it is not likely to take infantile cholera. If fed on the bottle, then comes the great problem, what to feed? Some children, healthy and with good digestion, scarcely sicken on anything. Some are fed on cow's milk, diluted or undiluted, oatmeal, condensed milk, &c., and a mother so fortunate as to get her child through on this roughness will boast of her success. Oh, the ignorance displayed in some cases? It will not do to take such risks. If a child has infantile cholera, what shall we feed? We answer, nothing but the breast of a healthy mother; but we are met with the remark that babes are not all so fortunate as to have mothers. Then get a wet nurse, and if not, then you must feed artificially. Now what? Infants are not nourished by what is swallowed, but by only what food is digested and assimilated. They differ in digestive power, and the difficulty therefore lies in inability to formulate a food applicable to every case. As age and strength increase, there is a corresponding

development of the gastro-intestinal functions and a call for stronger food. As the system reduces by disease, the digestive function is correspondingly reduced; and the impairment may be so great as not to admit of the simplest nutrient material. Strength of the constitution depending upon the digestive and assimilative powers, the patient must soon yield. An infant may, therefore, starve to death when nutritious elements are given, but vomited, or passing through whole; on these accounts many changes of diet, both in quality and quantity, must be anticipated and made.

As this lesson cannot be fathomed, it is the safest plan to keep close to what Nature has designed for the general nourishment of the infant. If, then, a mother's milk cannot be had, its qualities and quantity should be accepted as a standard.

Infants have but little secretion of saliva during the first few weeks. The secretion of pepsin and acid is fairly well established; the secretions of bile is considerable in quantity; the pancreatic secretion is very poorly developed in early life. Fats are fairly digested, cane sugar poorly, starchy foods are an abomination in feeble digestion. The formation of acids in the alimentary canal is likely to become excessive whenever foods cannot be digested; fermentation is the result, giving rise to irritation and diarrhoea.

Manufacturers of infant foods have sought to overcome the defects of cow's milk and to give us artificial foods as near like the natural as possible. Much credit should be given these firms for what they have done. Some babies do well on a certain kind, while the same food will not agree with others. As to these foods, we are guided by selecting that food having the nearest analysis to mother's milk; but we have tried one and then another, and another, until we find none that will answer in all cases.

The following is a good preparation for a child twelve months old:—

Milk six tablespoonfuls, cream one teaspoonful, lime water one tablespoonful, sugar of milk one teaspoonful.

Lime water may be used in amount according to the excess of acid fermentation. Some recommend as high as one-half to milk, but large quantities may irritate and do damage, especially a constant use. One-fourth or one-eighth is in most cases sufficient. Lime water contains only one-half grain of lime to the ounce.

We often abandon all milk foods and use mutton tea, perhaps a teaspoonful or two of cream in it. Thus you can see we exercise great care and am governed much by the condition of the child's stomach and bowels. Giving any kind of milk foods, and curds pass the bowels, that food must be withdrawn or peptonised.

## \* \* \* \* WHAT TO TEACH OUR BOYS.

NOT to tease girls or boys smaller than themselves.

When their play is over for the day, to wash their face and hands, brush their hair, and spend the evening in the house.

Not to take the easiest chair in the room and put it directly in front of the fire, and forget to offer it to their mother when she comes to sit down.

To treat their mother as politely as if she were a strange lady who did not spend her life in their service.

To be as kind and helpful to their sisters as to other boys' sisters.

Not to grumble or refuse when asked to do some errand which must be done, and which otherwise takes the time of someone or other who has more to do than themselves.

To take pride in having their mothers and sisters for their best friends.

To try to find some amusement for the evening that all the family can join in, large and small.

To take pride in being gentlemen at home.

To cultivate a cheerful temper.

To learn to sew on their own buttons.

If they do anything wrong, to take their mothers into their confidence, and, above all never to lie about anything they have done.

**STEEDMAN'S Soothing Powders for Children** cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Walsworth, Surrey. Sold everywhere. Please observe the *EE* in Steedman.

**TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES** quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 1d. and 2s. 9d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, R. T. TOWLE, Chemist Nottingham. Beware of imitations, injurious and worthless.

## "THE SKULL AND THE BODY."

### A HIDDEN DEED,

THE

### MYSTERY OF GRUNDY SQUARE.

By T. HUGH BRYANT.

*"Please send the body immediately. Be careful how you pack the trunk. Hide the deed, if possible; but on no account leave out the skull, as you suggested."*

"HORRIBLE! What are we to do?" cried Mrs. Chevalier, as she perused the above sanguinary missive, and then passed it on to her equally horrified spouse, who in his turn ejaculated, "Horrible! Ghastly!"

"The letter, of course, is mis-directed, and is intended, doubtless, for the new people at '32'; unfortunately, they are named 'Chevalier,' also."

"I think, my dear, we had better communicate with the police at once," cried Charles Chevalier when he had sufficiently recovered from the shock caused by the reception of this horrifying epistle.

"Decidedly, dear," assented Mrs. Chevalier. "If a dreadful crime has been committed, we may be the means of bringing the criminals to justice—but we shall have to move out of the Square, as our names being the same, people will not trouble to inquire whether it was at 22 or 32 that the ghastly deed was done, and we should be marked people for the rest of our lives."

"Nonsense!" replied the more matter-of-fact husband. "If one of these people has committed a murder, he or she will be caught and hanged, thanks to this letter" (tapping it satisfactorily).

"I consider it quite providential that it has fallen into our hands. There is some chance now of one of the many undiscovered crimes that are daily being committed in our midst coming to light at last. Percy Chevalier, I believe is the name of the man living at 32," continued Mrs. Chevalier, "as letters have come here before; he is in some mysterious kind of business, for I often see the telegraph boy going in there, and he also visits the solicitor living opposite almost daily."

"Ah!" Mr. Charles Chevalier, having delivered himself of this portentous monosyllable, resolved to proceed straightway to the police station, and disgorge his news.

The sergeant was delighted with the case; not only were visions of future inspectorship floating in his mind, but also the prospect of an exciting episode in the somewhat too respectable and highly decorous town of Tonbridge. No such vulgarities as murders or divorce cases ever disturbed the placid monotony of existence in that excessively genteel spot.

The Chevaliers of 32, Grundy-square had already been subjected to the suspicious eyes of the inhabitants, as no one but the landlord of the house knew anything about them, and as this worthy was a close-listed, excessively unpopular solicitor, no one ever thought of asking him questions about such a personal matter as the respectability of his tenants.

"We must watch the house—both the wretches (meaning Mr. and Mrs. Chevalier) are implicated in the atrocious affair," said the inspector, when the letter was shown to him. "This (holding up the epistle) evidently comes from the husband in London to the wife. He, or both of them, have murdered some poor thing who has in some way injured them or stood in their path, and he has gone off to London to find some place of security in which to dispose of the remains. The address on the box or package will give us some clue to his whereabouts. As you see, he is sharp enough not to have written an address in his letter."

"What will you do?" asked Chevalier, with some concern.

"There is only one course for us to adopt," replied the inspector. "To follow the track of the parcel or whatever description of package that leaves 32, Grundy-square."

"How is Chevalier of 32 to know about sending a parcel," queried Mr. Chevalier, of 22, "unless the letter is delivered? We had better put it in another envelope and re-address it."

"A good idea! It shall be done."

Accordingly, for the next few hours, Mr. and Mrs. Charles Chevalier and the police officers were on the highest pinnacle of expectant excitement. About nine o'clock the next morning Mrs. Chevalier's clear voice was heard calling upstairs to her rather belated husband: "Charles, Charles! come down quickly—here it is!"

Charles bounded downstairs, and took up his position behind the drawing-room curtains, his toilet being still rather incomplete. A huge American portmanteau was being hauled into the railway van.

"The thing is large enough to hold a whole family!" said Mrs. Charles. "I wonder how many poor things are inside?"

"Don't be silly, Annie! Didn't the man write in the singular number: 'the body' and 'the head'?"

"Oh, yes! I forgot."

"Now I'm off! I want to get to the station in time to see the address."

"Silly boy!" laughingly said Annie. "Are you going like that?" alluding to his lack of coat and collar."

"No, dear, of course not." He was already half way upstairs again; returning, however, in a few seconds, he said, "Don't wait breakfast if I'm not back in half an hour. Here's a piece of luck—a hansom passing. Good-bye, darling, for the present." And away he bolted.

Grundy-square was not far from the station, and Charles Chevalier found the inspector and sergeant of the police awaiting the arrival of the van, as a detective had told him the "box" had been fetched away from the house.

At last the van arrives—now for the address:—

"Miss Chevalier, 44, Dalrymple-street, Mayfair."

"Ah!" said the inspector.

"What do you think of it?" enquired Charles, in a stage whisper.

"Complicity!" was the curt reply. "However, I have wired to Scotland-yard, and the box will be handed in to the house by detectives. Miss Chevalier, if there is such a person, will be arrested at the same time as Mrs. Percy Chevalier here."

The huge portmanteau was duly consigned to 44, Dalrymple-street, Mayfair, and opened in the presence of two detectives, Miss Chevalier standing under arrest and looking on at the unpacking.

The first thing they came upon was a quantity of lace.

"Do you think I have been smuggling all these things from Paris?" said Miss Chevalier, with a laugh.

"All impudent bravado," thought Detective Hughes, not deigning a reply. Next came a very stylish body of an evening dress; then a very peculiar bag which contained a lot of manuscript paper and several microscopical slides; then several books upon different medical subjects—then they took out the tray.

"Oh! please be careful, or you will break the skull!" cried the girl, as the men began to overhaul the contents rather roughly.

"What?"

"The skull! There is a skull in that box, and several other human bones!"

"Yes, sure enough, here it is," exclaimed Hughes, as he came across a hard square box. Having received this timely caution, he lifted it out with care. There, most carefully and securely packed in this wooden box was—not the severed head with probably distorted features, that the detectives longed to discover—but an ordinary skull used by students when studying anatomy. The men were dumbfounded, and looked at one another with decidedly sheepish countenances.

"Well, now that you have saved my maid the trouble of unpacking that trunk, perhaps you will be good enough to favour me with the particulars under which I have had the pleasure of receiving an introduction to you?" asked Miss Chevalier, with eyes which were literally scintillating with laughter.

"We are only acting under instructions," sulkily replied Hughes, mentally vowing vengeance on the Tonbridge superintendent for sending him on this fool's errand.

"Whose?"

Hughes thought the simplest way out of the difficulty in which he found himself was to relate all he knew. Miss Chevalier simply screamed aloud when she heard the interpretation that had been put upon her brother's letter to his wife.

"Percy, Percy!—come here!" she shouted to her brother, who had just entered the front door. "Isn't this amusing! What an idiotic letter you must have written to Edmée—and put the wrong number also. These people have come to look for 'the body, the trunk, and the skull'; and you told her to conceal 'the deed,' so she put it into the box with the skull."

\* \* \* \*

For the enlightenment of the uninitiated, suffice it to say that "the body" was one left behind by Miss Chevalier at her brother's house upon her last visit, and which she requested might be forwarded in "the trunk," with her nephew's medical books, microscopical slides and "skull" (he having only recently joined a London hospital), and "the deed" was a wedding present for Miss Chevalier, of freehold land from her eldest brother; but as he did not wish his other brothers and sisters to know of the transaction he requested his wife to conceal it, fearing that if any of them were present when the trunk was opened, their natural inquisitiveness might lead them to ask what the parchment was, thereby occasioning some little unpleasantness, as the property in question being situated in a very desirable and fashionable part of the town, was much coveted by them all.

"Well, after all said and done," laughed Percy Chevalier, when he heard the news and the apology of the detectives, "there's no help for it; the police can do no wrong, and there's no remedy for us, so we must make the best of a bad job—anyhow, it will do for a plot for my next novelette."

## DANGER IN WET CELLARS.

SCARCELY anything is more prejudicial to good health than wet cellars. Rheumatism, bronchitis, pneumonia, and malarial affections, including neuralgia and sciatica, are some of the dangers to be apprehended. Damp cellars mean foul and noxious air, and should be sedulously avoided. Now, before the rains come, while the water or moisture is considerably below the surface, is the proper time to prevent these evil influences. Drain tiling, laid outside and a foot below the base of the foundation, and running diagonally across the cellar, and connecting with the outside drains, and thence leading to the street drain or some low ground, is the best and perhaps the only safe way to drain, not only the cellar, for a foot below its surface, but the outlying ground for several feet in all directions from the house. This drain, while having a free outlet, should furnish no opportunity to put into it anything but what is extracted from the soil. It should never on any conditions have any connection with sewage, nor receive any kitchen slops or surface water, and should be well below the frost line. If possible, the cellar floor and the sides of the wall, as high as the surface of the ground outside, should be well cemented. It is well, owing to the great porosity of brick, if used for foundation walls, to have intervening layers of cement, so as to prevent, as far as possible, the upward passage of the water by absorption. This drain should be laid as far as possible from the well, lest in some way its contents should be emptied in the well and contaminate the drinking water. The expense of such drainage and wise precaution would be but a trifle—especially if, by its neglect, a protracted sickness, with its doctor and nurse bills, and eventually a funeral, should be prevented.

The soundest wisdom and strictest economy favour the adoption of all measures that lessen, or reduce to a minimum, the dangers from preventive diseases.

## PHRENOLOGICAL DISCUSSION.

A REVIEW BY "H., M.D." OF THE LETTERS THAT HAVE APPEARED ON PHRENOLOGY.

I MUST be excused for not reverting again to the letters that appeared in the FAMILY DOCTOR for July 22.

"Prof. Max Millar!"—Professor of what and where? This critic of my original article ventures to assert that Phrenology is a "true science." Assertion, Sir, is not proof, and as an argument an assertion is not worth the waste of breath that it took to utter it, unless bolstered up by facts. The Professor then gallantly tries to shield himself behind physiognomy, but *physiognomy* is not *phrenology*; I said nothing about it. My critic goes on to blow his own trumpet, and tells us how he has examined "clergymen of the Church and Nonconformists, doctors, lawyers, and all classes of men." No doubt. Carlyle once said something extraordinarily pungent, and perhaps a little rude, about "mostly fools." The Professor in his last paragraph having blown his own trumpet, sounds forth the praises of Phrenology, and then finally ventures on a prediction, which I trust will turn out all right, for the Professor has adopted the course of a wise man, and left all attempt at serious argument alone, for the case does not admit of it.

"T. G. Roscoe" is rude, and doses me with plenty of advice. He tells me that I have "made a mistake in rushing into print," and, furthermore, "that doctors are a mistake to themselves, and their past history has been characterised for blindness and stupidity." This kind of nonsense is best left unwritten. Chaff is allowable, but vulgar abuse I cannot notice, and I leave his letter to the judgment of his betters, my readers. There is not one word of serious argument in it. He found out what everyone must have seen, that by an accident an "organ" was wrongly named. A mistake I regret, but which I did not observe until too late to rectify.

"J. Moon" is too involved in his expressions on paper to follow clearly. He seems, from what I can gather, to argue as much one way as the other. He tells us it will puzzle me to "tell what temper is in its varied aspects." I decline the puzzle. It has nothing to do with my position *re* Phrenology, and the same may be said of "does not mean to infer—he cannot mean that a knowledge of ourselves will give a knowledge of tendencies and character." I never said it would, or would not. I did not infer it, or suggest it. I trust this disclaimer will satisfy my critic. "Can anything be learned well or acquired without application?" asks "Mr. Moon"; and he goes on to express his great astonishment that a medical man holding this up as a loophole for the phrenologist. But I never said anything about the matter. I am afraid "J. Moon" has got mixed up in his thoughts. Let him restate his matter in a clear, logical, understandable way, and then we will deal with it.

"W. H. H. N." takes up a curious position. He tells us that on reading the last three issues he is struck by the absence of "facts" from the discussion, and then proceeds to give some, and commences with the "frontal sinus." But if he will re-read my article he will find it dealt with. I am afraid he cannot read his FAMILY DOCTOR carefully—perhaps he scans it in an arm-chair, solaced by a pipe and a "peg," when visions grow hazy and ideas flit to and fro like gnats on a summer's eve.

To "F. R. Oliver" let me point out, that when a cattle dealer is judging a "beast" he has before him a mass of muscle which can be *handled and judged by the eye*, but thoughts are not things you can touch and see; therein lies the difference.

"Thomas Tinson's" letter boiled down by the ruthless necessities of the sub-editor (who, I am bound to say, treats his correspondents with marked liberality), does not present any argument that needs a reply. When the chaff was winnowed from the wheat of his letter there is so little of the latter that I am surprised that that little even saw the light of day at all.

Now I come to a more serious opponent,

"Anglo-Austrian," but when looked at squarely in the face the bottom falls out of his pseudo barrel of facts. He advises me first of all to read certain books. I have already done so, pardon me not doing so again; I have newer material still unread. I did not go to newspapers for my information; if in my casual reading I picked up a little worth knowing from my *D. T.* who shall object with reason? Then he quotes at length Sir Geo. M. Humphry to this effect:—"The skull is moulded upon the brain, and *grows* in accordance with it. The size and general shape of the brain may be estimated with tolerable accuracy by the size and general shape of the skull. The opponents of Phrenology, by denying this, do not in the least advantage their cause in the estimation of thinking persons, because the statement is of a kind at once to commend itself to common sense as being highly probable. The frontal sinuses and the projecting ridges, the inequalities on the surface of the skull, which have no correspondence in the interior, do not amount to much, and *show only that allowances must be made, and that we must not expect in this way to form an accurate estimate*; but they do not affect the principle that the skull is moulded upon and fitted to the brain, and that its exterior does, as a general rule, convey pretty accurate information respecting the size and shape of that organ. The arguments against Phrenology must be of a deeper kind than this to convince anyone who has carefully considered the subject." It will be noticed, just to add a little touch of realism to the quotation, that I have put two and a half lines in italics, and shall I say, for the information of my critics, that I entirely agree with Sir Geo. M. Humphry. The "*allowances*" that have to be made was only one of my collateral arguments, which added another item of uncertainty to this science (scio—I know) of Phrenology. My principal argument was that you cannot judge of the *quality* of a man's brain, and that *quality* has in brain work no relation to *quantity*, and that even as regards quantity if you admit, which every reasonable man must do, that there is a close relation between the amount of grey matter and the brain-power, then you *cannot judge of its amount* from an examination of the skull (external) because the *depth and complexity* of the convolutions, which would be unobservable from the skull exterior, vary to a large extent, and even granting, for argument's sake only, that you could estimate the amount of grey matter with tolerable certainty (which you cannot), you still have no means of estimating the quality of the ganglion cells, and if you choose the quality of the nerve matter, inasmuch as many admitted fools and persons of slow and even weak intelligence have a good physique and fine muscular system, so that it is obvious there is no relation that is *satisfactory as a test* between the two. But what I particularly want my critic to grasp is the fact that the *pleating* of the convolutions may or may not be very extensive without making any impression on the brain-case, and, as a matter of fact, it varies largely; with increased pleating you have increased amount of grey matter, all of which shows that even if there were not the inaccuracies pointed out by Sir George Humphrey, you still are in a fog. The brain-case, whilst the bones are still membrane, does undoubtedly grow with the brain, and impressions are made on it by the more prominent convolutions, but the *internal impressions give no outward sign*.

See what a difference ensues to the shape of the skull from the length and method of delivery in childbirth. It is nearly always possible to hazard in after years that so and so, from the shape of his skull, was delivered during birth by forceps. Again, it is well known that children who made their appearance into this world feet first have an entirely different shaped skull from those that come vertex first. Any consulting midwifery expert will bear me out in this, and the effect is permanent to a large extent. What a curious position the professor of Phrenology would be in when placed in front of a child whose head had been bandaged during infancy in order to produce a better shape, a course frequently pursued even in England, common on the Continent, and in vogue in certain semi-savage tribes; the shape is thus permanently altered by this means,

Does the phrenologist mean to say his thinking powers are altered also? If so, I suggest that a society should be formed, in view of the statement that criminal tendencies are hereditary, to bandage the heads of children born in our criminal population. Bandaged in directions approved by professors of this *true science* great good might (!) be forthcoming.

But to return to "Anglo-Austrian." Cannot he see that if the *paths* of the nerve currents (white matter) are irritated the same effect is produced as if the centre was irritated. I could give countless instances of it. Gall undoubtedly did give an impetus to the subject of localisation, but he applied the genius of his industry to wrong conclusions. He made this great mistake, *he fitted his facts to his theory*, which he formed before his facts were complete.

"In spite of all that has been said against Gall (the founder of Phrenology) and all that has been written in deprecation of his labours, beyond all doubt his researches gave an impulse to the cerebral localisation of our faculties, the effect of which is especially visible in our own days, and I look upon his work as a vast storehouse of knowledge, and as an imperishable monument to the genius and industry of one of the greatest philosophers of the present age."

In this paragraph all "F. Bateman" does is to state that Gall gave an impetus to cerebral localisation, and then pays a tribute to his industry and genius, *but he does not say* Gall was correct, far from it; if what "F. Bateman" teaches in his work is correct as a whole, then Gall is wrong. I am afraid "Anglo-Austrian" is a careless casual reader, his quotations do not in the least, as any impartial person must admit I have shown, advance his position one iota.

"E. D." again wets his pen, and declines to read Oliver Wendell Holmes's works, whose writings I will vouch "E. D." will find far more entertaining than those he names, and calculated to help him to understand that a serious argument cannot be met by a discussion as to whether my writing on Phrenology is a waste of time or not. It is, I may point out, a waste of my time to review a letter that contains not a single line of argument, and therefore I pass on to "A Lover of Justice," whose letter is devoted to a discussion not on the merits of Phrenology itself, but on a discussion as to its probable fields of usefulness if applied by doctors. Quite so, but inasmuch as I have endeavoured to prove that Phrenology is a "delusion and a sham," the sphere of usefulness of a *delusion* hardly comes on the carpet yet. Time enough to discuss its uses when it is proven true, but "A Lover of Justice" must see we are retrograding, and Phrenology is on its trial, and I am assured a verdict of guilty will be returned. One word to "E. D." before I close. He must surely see that it is absolutely unreasonable to ask me to name in public print *living persons* with retreating foreheads, or even idiots with prominent ones, it would be highly personal, and even the latter class must be protected from naming in their affliction.

Having now answered my critics, I would earnestly impress on all the absolute necessity of keeping to facts; it lands us nowhere arguing the "previous question." If, as I have been told, I have not the bump of "cautiousness," how do you suggest any proof as to whether I have or have not this bump? If I think I am cautious, naturally I think you wrong, and the end is, we are no nearer any conclusion than before. Someone has kindly sent me a pamphlet on "The Phrenological Aspect of Modern Physiological Research," by the President of the British Phrenological Association, pointing out that he meets all my objections to Phrenology. I have carefully perused it, and a more garbled, trivial piece of reasoning I never met. One would have fancied that the President of this "true science" would not indulge in reasoning of this kind, two specimens of which I give as a sample of the rest, and confidently leave the work to the judgment of his peers. He is discussing Dr. Ferrier's cerebral localisation, and the results he got from experiments on monkeys. I give the extract exactly as it appears, without the annexed diagram:—

## "VENERATION."

"The centre 2 lies on the organ of respect, veneration, godliness. This is the sentiment that a lower animal may not be able to exhibit,

yet Dr. Ferrier's monkeys exhibited 'flexion of the thighs, rotation inward of the leg, with flexion of the toes,' the nearest approach to bending the knee in worship that a monkey could be expected to exhibit."

Did you ever hear of a monkey engaging in worship? The attempt to fit the fact of the "flexion," &c., of the thighs as an indication of worship is extremely ludicrous. Here is another extract:—

#### "BENEVOLENCE.

"Further, when he stimulated 5, which is on the phrenological organ of benevolence, the monkey did its best to confirm phrenological teachings, for it showed 'extension forwards of the opposite arm, as if the animal tried to reach or touch something in front.' It wanted to lend a helping hand."

This is really very comical. Because this poor monkey extended forth its hand or a portion of its brain being stimulated, it is evidence that experimental physiology bears out Phrenology, and a monkey has an "organ of benevolence"! First get your theory, then fit your facts (*sic*), and this must be done to save this "true science" being laughed out of court.

But this is on a par with the arguments generally used, not one whit better or worse. One would fancy the worthy President was poking fun at us, except that the pamphlet with its illustrations must have cost his pocket no small sum, which I apprehend is the only serious matter about the tract.

### A COLONY OF MERCY.

ALL who want to make themselves acquainted with a work which forms one of the most romantic chapters in the history of modern philanthropic effort should read Miss Julia Sutter's singularly interesting book, which bears the title that we have placed at the head of this article. If any of our readers can go themselves to visit it, they may find the means of spending a charming holiday, and at the same time of gaining direct personal knowledge of a new world full of delightful surprises. Westphalia is not a hackneyed country, like the Rhineland or Belgium; and it is famous for other things besides hams. Visitors to it will find, for one thing, that the people speak a dialect that has remarkable affinities with provincial English; and they will make acquaintance with a collection of folk-stories that in freshness and quaintness have a charm that is all their own.

The colony in question is to be found in a beautiful valley in the great Teutoburger Forest, behind the town of Bielefeld. This part of Westphalia can be easily reached either through the Netherlands, or from Bremen on the north, or from Düsseldorf, in the Rhine country; and whichever route the visitor may choose, he will find in it abundant opportunity for the observing of primitive manners and quaint costumes. If he is already in the neighbourhood of Düsseldorf, his presence there will probably be due to an interest in modern art, and in the school which takes its name from that æsthetic little town on the lower Rhine. If his route lie through the Low Countries, he will no doubt recall many stirring episodes in the marvellous history of a people who had to carry on a war of life and death both against powerful and savage human foes, and against the terrible assaults and encroachments of the sea. While, if he travel by way of Bremen, he will not only see the tokens of an enormous marine traffic, chiefly with America, but will also, no doubt, recall the delicious story told by Grimm of the companionable creatures who determined to be the official musicians of that town, and their strange adventures by the way.

What would our supposed visitor find when he arrived in the neighbourhood of Bielefeld? He would find, first, a collection of homes forming a colony, to which the general name of "Bethel," or "Zion," has been given, although there are parts of it which are separately known as "Sarepta" and "Nazareth." These names will no doubt have the effect of repelling many who would look with favour on most forms of philanthropic effort; but if this not unnatural prejudice be got over the inquirer will find in this village and its suc-

curals much to interest the mind and to move the heart. What he has come to visit is a colony of epileptics—a sad enough sight in itself, no doubt; but the sadness is greatly modified when you look at the beautiful surroundings of the place, and become acquainted with the varied arrangements that have for their object the employing of the energies of the inmates and the making of their lives useful and happy. The situation has been admirably chosen. The afflicted population are accommodated in buildings that show various styles of architecture—the prevailing type being the picturesque, high-roofed, gabled houses that are characteristic of Northern Germany. Everywhere you look you are reminded that you are in the midst of a forest country; and up there, on the highest point of a richly-wooded ridge, you see the stately church, the foundation-stone of which was laid by the late emperor, Frederick, while he was still crown prince, just ten years ago. This strangely touching gathering of homes has grown quite gradually during the last twenty-six years. It was begun in a very humble way by the purchase of a small peasant's cottage, which was first occupied by four epileptics, and consecrated to its purpose, by the name of "Ebenezer," on October 14, 1867, but in the silent lapse of the years, the unpretending cottage, still holding its place of honour on the ground, has grown into more than a hundred substantial buildings, scattered picturesquely over a wide space; and the four patients of 1867 have become a great multitude, 3439 in number, of whom 1388 were present in 1891-92, the year that has last been reported on.

All sorts and conditions of men are to be found in the colony, and they are engaged in a great variety of employments, which are pursued to a large extent in the open air, in forest and field, and which embrace gardening and farming, and other out-of-door operations. Bakery and smithy and brick-kiln are to be found in the establishment. Lock-making, carpentering, tailoring, shoemaking, house-painting, bookbinding, book-selling—these are the occupations that are followed, with a large measure of success. Shelters, schools, hospices, convalescent homes, children's houses, and a hospital provided with a hundred and twenty beds, find a place in the arrangements for the comfort and the cure of the afflicted colonists. Provision is made, however, rather for the comfort than the cure of the patients. Specially pathetic is the sight of the Kinderheim. *Morituri te salutant*, cried the gladiators to Cæsar, as they looked up from the arena in which they were forthwith to meet their fate; and it is touching to see these innocent children, suffering for the sins of their parents, destined every one of them to an early death, yet moving about in childish glee, enjoying eagerly the amusements which their nurses provide and superintend, and gathering in excited groups about the splendours of a German Christmas-tree.

The head and soul of the colony, the founder of the first cottage-home, and ever since the moving spirit of the multifarious agencies that are carried on in this Westphalian valley, is Herr von Bodelschwingh. He is a pastor, although he has the aristocratic prefix to his name. The noble and beautiful and marvellous work that he has accomplished has grown quietly and naturally out of a devoted love that has never known the feeling of weariness. From this meagre sketch of what he has done, it will be seen that he is a highly practical and many-sided philanthropist. Herr von Bodelschwingh has been severely criticised, misunderstood, and, consciously or unconsciously, misrepresented. Criticism is easy work. Any fool can stand aside and find fault. To many the picking of holes is a most congenial occupation. And it is not pretended that Herr von Bodelschwingh's methods have always been the best. No doubt, as Prof. Eulenburg points out in his highly appreciative notice, it would be well if greater advantage were taken of this unexampled opportunity for the scientific study and treatment of the various forms of epilepsy, with a view to prevention and cure; but it remains true that this simple German pastor has done a work for which he deserves the gratitude of the whole of Europe in his unique Colony of Mercy.—*Sanitary Record*.

### TRAMPS AND INFECTION.

THE interesting discussion at the Newcastle meeting on the spread of infectious diseases by tramps opened up a question which is of the gravest importance to the community, says the *British Medical Journal*. The efforts of sanitarians in regard to the suppression of infectious diseases are at the present day mainly directed into two channels: one the production of such a general improvement of the sanitary surroundings of the people as shall render them more able to resist disease, the other the prompt removal and isolation of the sick, so as to prevent infection of the healthy. Some of the younger and more hopeful among us may think to see the day when the first of these shall be sufficient, but certainly at the present time, and so long as the lives of the poor remain as they are, we can no more afford to allow the free dissemination of infection than a farmer can permit the use of matches in his rickyard.

Everywhere this is being recognised. Notification is spreading over the land, isolation hospitals are arising on all sides, which, although often very imperfect, show at least that the principle is being widely accepted, by elected and directly responsible bodies, that individuals shall not be allowed to infect the community. As a consequence, respectable citizens are finding their liberties in many respects curtailed, workmen are debarred from their ordinary means of earning a livelihood, children are shut out from an education which is their right, and ratepayers have to support large hospitals, all for the sake of restraining the spread of disease, and yet the vagrant is allowed to roam over the country caring for none of these things, and carrying with him his rags and his infections from town to town, without let or hindrance. We need, then, feel no surprise that people who have to submit to such restrictions, and who do submit to them with more or less willingness in the hope of thereby deriving some protection, object strongly to their efforts being antagonised by the wanderings of tramps and vagrants.

The sturdy beggar and the homeless vagrant have troubled the law-abiding citizen far back into the times of early history; the tendency to vagrancy, the dislike to settled habits, the hatred of control being so ingrained in a certain proportion of the human race, that the genus tramp—with all its dirt and tendency to spread disease—has always been able to hold its own against the laws, often harsh and cruel, which have for ages been levelled against it; and we certainly must not allow any hope or expectation of an advancing civilisation leading to the extinction of the race to stand in the way of such measures as may be found necessary to prevent the evils arising from its nomadic habits.

Dr. Ring pointed out how frequently epidemic diseases were carried into new districts by tramps, and how common lodging houses and casual wards became dispersion points for infection. Dr. Armstrong also has shown the immense importance of vagrancy in the dissemination of small-pox; seventy-three per cent. of the urban districts in which small-pox had occurred, and from which he got returns, having sooner or later been infected by vagrants many of them having had it introduced in the same way over and over again. The case, in fact, in regard to small-pox is so strong, that perhaps the discussion drifted unduly in the direction of compulsory re-vaccination as a way out of the difficulty, for the probability is that a mode of dissemination proved in one disease operates in others, and that many a strange and unaccountable outbreak of diphtheria or scarlet fever dates back to the cup of water given by a villager to some passing tramp.

Unfortunately the remedies proposed all touch freely on that thorny question—the liberty of the subject. Compulsory detention, re-vaccination, and disinfection, with compulsory reporting of their movements, and even, as recommended by Dr. Ring, the registration of their comings-in and goings out on a card carried for the purpose, form the staple of the suggestions which were made; but when one realises that we have to deal with people who dislike gaol chiefly because it brings them

under the ken of the authorities, and to whom the "ticket," with its suspicious resemblance to a ticket of leave, would seem a greater punishment than the penalty for not using it, we begin to see some of the difficulties with which the question is hedged around. Nor are these lessened by the fact that, although tramps form a class apart, separate, and distinct from the rest of the community, they are intimately mixed up in their haunts and their movements with the unemployed poor. However much it may be insisted on that the tramp requires severe measures, the only places where he can be caught to be dealt with at all are the casual wards and the common lodging houses, in both of which he is mixed up with a crowd of unfortunates, out-of-works, and ne'er-do-wells, who by no means deserve the same severity; and although it may be true that an experienced officer can pick out the tramp at a glance—nay even, as was suggested, at a sniff—that his hardly the sort of evidence on which it would be right to condemn anyone to exceptional treatment.

We, like the Hindus, have our fairs and great gatherings, although with less religious aims, and ours, like theirs, doubtless act as disseminators of disease. Hop picking, harvesting, and strikes, all set up large movements of the poorest of our population, who become intermingled in our casual wards and lodging houses with detachments of that great army of 60,000 vagrants which is said constantly to perambulate our country, and, efficacious as it might be from a sanitary point of view to treat all these people like ticket-of-leave men, we hardly think it probable that Parliament would be induced to take that view.

In the meantime our authorities might certainly apply with greater vigour the powers which they have. Little control as we have over the tramp himself, we do already possess considerable authority over the keeper of the common lodging house. If the description of doss houses lately given in the *St. James's Gazette* are to be trusted, these dwellings are far indeed from the perfection which could be enforced by the law even as it now stands, and if it be objected that to make them clean and decent would render them too expensive for the tramp, we would answer—so much the better. The sooner the tramp can be driven to a reformed casual ward, where at least he can be washed and his rags be disinfected, the better for the country. It would probably well pay the nation to give him both bed and breakfast in return for being allowed to scrub him.

## VIVISECTION.

IT is pleasing to note that the medical fraternity are at least willing to concede that in experiments upon living animals unnecessary pain should not be inflicted. We might rest content with this if the limitation were not so variable. To a rapt enthusiast nothing which conduces to the end he seeks is unnecessary. Noble as is the medical profession, grand and useful as is the end at which it aims, and generous and self-sacrificing as are its members, it is nevertheless the case that its pursuit tends to make its devotees cruel.

Whoever thinks his work the most important of all things will naturally become cruel. If the healing of the body be the greatest of works, then nothing that aids such a cause can be considered cruel. Sound characters are of more consequence than sound bodies; nor are these in the noblest sense necessary concomitants of each other.

The man who in the cause of science is indifferent to the sufferings of a helpless dog, will be quite likely to care little for pain inflicted upon a worthless tramp. At what point he may pause and consider beyond that, suffering and life of more consequence than experiment and learning, who can tell?

It is unfortunate if vivisection operations are painless as is claimed, that the observation of them by disinterested spectators and the description given in medical journals have

created so wrong an impression. The story is told of a noted lecturer that to illustrate his teaching he brought before his class for experiment a living monkey. The poor creature trembled with fear at sight of the instruments designed for its torture and man's instruction; when the knife was applied it shrieked and struggled helplessly, whereupon the operator severed the nerves connecting with his victim's vocal chords; thereafter it could only in dumb pantomime manifest its agony.

It is said that much of the benefits which the art of medicine might thus have secured were lost by the impulsive action of a young lady, who sprang upon the stage and beat the learned professor over his head with her parasol. It is impossible to prescribe save in general terms to what extent vivisection may be properly carried. This is certain: No unnecessary work of this kind should be done. The infliction of pain for the mere purpose of illustration, is always unnecessary cruelty.

No person not possessed of a keen sense of the duty of man toward all beneath him, in his power, whether men or animals, should undertake such experiments. Vivisectionists should act under a full realisation of their responsibility in assuming that the pain they inflict upon the weak will be compensated by the joy they can bring to the strong.

Finally, it is gratifying to note that the medical fraternity now concede that unnecessary pain should be avoided. My recollection is that twenty years ago, the sufferings of the subject were if considered at least not discussed.

## MORALS AND LAWS.

By W. SCHOOLING, in the *Humanitarian*.

LEGALITY and morality are two rulers who hold sway over a large amount of territory in common, but each has in addition a sphere of influence where it reigns alone. Legality sometimes permits what morality forbids, and morality frequently commands when legality is silent. There are abundant opportunities for being legally immoral, and abundant legal punishments for acts that morality does not condemn. Legality is often immoral, and morality is frequently illegal.

Legality is chiefly concerned with external acts, morality influences thoughts and feelings besides. The one must of necessity coerce, the other does best to persuade. The one is formal and not readily changed, the other informal and flexible.

Laws are needed most where morals have least influence. Morality is most potent where legality has been narrowed in its sphere, and both are constantly varying, at one time forbidding what was previously enjoined, at another time encouraging what is subsequently condemned.

But abstract propositions such as these, require, as Pooh-Bah would say, that "corroborative detail which is calculated to give artistic verisimilitude to an otherwise bald and unconvincing statement."

The common territory of the two monarchs includes at present among ourselves such matters as theft and murder, incendiarism and tax paying, about all of which there is considerable unanimity of opinion: Though, even in regard to such matters as these the dictates of morals and law have varied and do vary

greatly. The Companies' Acts permit wholesale swindling, which, though condemned by morality, is currently judged by success or failure. The honest trader who is unsuccessful is rigorously condemned, and the successful promoter of a bogus mine is emphatically and nauseatingly belauded.

Indeed, limited liability is an excellent arrangement for excluding the sway of either law or morals. The favours bestowed by Parliament on a dishonest company are only equalled by the convenience of a corporation having no conscience to trouble it, and of an anatomy presenting no opportunity for that physical punishment sometimes administered by the boots of the outraged. Murder is not readily done in too open a manner among us now, but there are prenatal and post-natal suppressions that sail very near the wind, and elsewhere we see a public opinion—practically a morality—enjoining a duel that may become a murder, while the law forbids it. Though probably morality allows the modern duel because it is usually harmless, and the law forbids it because there is a chance of it being occasionally injurious.

Incendiarism is forbidden by the law and by some codes of ethics, but there are devotees of a certain social ideal, who appear to consider a fire a usual and meritorious method of persuasion when strikers cannot get their way, and dynamite a desirable argument when Parliament is obstinate or a Czar despot.

Legality has always insisted very strongly on the paramount duty of paying taxes; while morality, though usually allowing the necessity, has seldom had occasion to become emphatic on its virtue; and there are not a few among ourselves who feel that the rates levied by vestries, school boards, and county councils, would be very different from what they are did morality rule them instead of law.

Political restrictions on account of sex or theological opinion are again matters where legality is assuredly not moral, and where there is very good reason for holding it to be immoral. It may be advisable to withhold certain rights of voting and serving in public ways from people whose knowledge is not such as to give wise opinions, or whose stake in the country gives them an insufficient interest in its material prosperity; but the exclusion of educated women who contribute to the revenue of the country is a survival from a barbaric past, no longer plausible as expedient, and no longer justified by morality.

History is full of instances where morality has prompted conduct in vigorous opposition to law; and the progress of liberty of thought, of speech, and of action, owes much to those who have obeyed the dictates of morals, even at the cost of punishment by law.

It is only very slowly that the sphere of law has been restricted from regulating opinion and speech, dress and behaviour. In England to-day we may think as we like, and say almost what we please, and this prepares the way for culture to teach us to think wisely and speak well, by which reservation we escape that condemnation that Mathew Arnold used to hurl so eloquently at those worshippers of "machinery," whose aim is to be free without troubling whether they are using their freedom well or ill.

But this freedom tends to make law more and more a matter of externals only, and to leave thought and opinion to morality, which, of course, rules conduct too; it tends also to lessen

the influence of law and increase that of morals, by doing effectually, by ethics, what Acts of Parliament imperfectly achieve.

The more we yield to the persuasion of morality, the less we like, and the less we require, the coercion of law. There are very many good people who are not restrained by Act of Parliament from doing wrong, and who would continue to act rightly, however legal it might be to do otherwise.

And here there comes in, not only the distinction between coercion and persuasion, but between formal and informal influence, between rigid and flexible rule.

A law is, for the most part, supposed to be applicable to every member of the community, and is the same for all, and the consequence is that it is a dead letter for the great majority, and it can only be altered by a lengthy and cumbersome process, after the discovery of abuses, and their toleration for a long time. Even then, there is considerable rigidity about its execution and no pliability suiting it to different cases. But morality changes gradually and most imperceptibly, there is a higher code adopted by the better part of the community before it is received by the worse, and it is only when a considerable proportion in a state has adopted, voluntarily, certain moral principles, that they become crystallised into law. Modification is easy in the proof sheets of morality, it is difficult in the stereotype of law.

The practical deduction from all this is that whatever changes in the conduct of a community appear to be conducive to its improvement must be made first in its moral sentiments and may (or more probably may not) be with advantage subsequently made in its laws.

There is the disadvantage that many people are inclined to base their moral standard on the current legal code, but if they can be persuaded to consider the chaotic incongruity we have just been indicating, they may come to think that greater happiness and greater benefit is likely to be derived from a rational morality.

Perhaps the idea is gaining ground that the passing of Acts of Parliament is a laborious process, by which square pegs are constantly being inserted in round holes with a sublime indifference to the nature of the holes, the parliamentary pegs are to fit, and a sanguine expectation that round and square may somehow prove synonymous. There is better reason for thinking that rational morality has a self-adjusting arrangement for fitting round pegs into appropriate circular apertures.

The great bulk of people have no rational morality, only traditional, and if new cases appear that call for moral regulation they are frequently at a loss when their inherited notions of right and wrong give them no guidance. So it is that when scientific investigation throws a fresh light on physiological phenomena that traditional ethics exhort to denial of the discovery, or are unable to assimilate the new facts that ought to have a potent influence in modifying ethical theories.

Of course, those who desire to modify moral opinions must keep pegging away in order to achieve their object, and they must do so with apparently disproportionate emphasis. The sensible reformer does not think the particular

reforms he is anxious to bring about are intrinsically more important than some other matters; but they may be unduly ignored, they may need to be especially insisted upon at a certain time, or it may be his special duty to emphasise them. Anyway, they have to be urged from many points of view: Appeals must be made to the rational to reason, and to the sentimental to feel. The scattered light from physics and physiology, from psychology and sociology, must be brought to a focus, and many images formed, many pictures made, of the improvement it is sought to achieve. It is only in this way that a change can come, gradually but surely working slight modifications in moral opinions that must precede law.

To a great extent, morality is a growth, and legality a casting. When the ethical growth has attained certain proportions it is sometimes encased in the rigidity of law, and if the growth is not arrested by the process, the law very soon becomes a bad fit, owing to the continued progress of the moral growth.

It is frequently necessary, when the conduct of some falls very far short of the moral standard of the great majority, that the coercion of law should be employed to prevent the injury to others that their degradation would cause; but where a desirable reform has to be made in the opinions of most, then it must be made in the growing organism of morals, not in the casting of law; in the proof sheets of ethics, not in the stereotype of legality.

To try to change moral opinions, to extend the moral sphere, is too often a disheartening task. It is fairly certain that every genuine effort will succeed in the long run, but apart from success or failure it is the duty of each to utter fearlessly the highest truth he sees, "knowing that, let what may come of it, he is thus playing his right part in the world—knowing that, if he can effect the change he aims at—well; if not—well also, though not so well."

**DRINKING NAPHTHA.**—Some people doubt the presence of naphtha in the worst kind of whisky and other liquor, but, says a correspondent, a large quantity of worthless liquor is toned up with this horrible liquid, and some men positively like the mixture. It used to be a common practice in chemical works throughout the world to adulterate alcohol used in manufacturing with naphtha with a view of preventing bibulous workmen from drinking it. The practice is not so universal now, owing to the discovery that men with a taste for pure alcohol will drink it almost as readily when thus adulterated as when chemically pure. As to the effect upon the human anatomy, it can be best imagined by pouring a few drops on to a piece of leather or raw meat, and watching the results.

THEY who would rule safely must rule with love, not arms.

THEY who would take charge of the soul, must never be too wise to regard the heart.—*Lord Lytton.*

A NOBLE act is one which is prompted by a good heart, and which it requires energy to carry out.—*Montesquieu.*

HE who reigns within himself, and rules passions, desires, and fears, is more than a king.—*Milton.*

## EASTON'S SYRUP.

WHENEVER this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Sold in 4-oz. bottles, 1s. 6d.; 8-oz. bottles, 2s. 6d. 16-oz. bottles, 4s. 6d.

### "NO USE TO GO TO CHURCH."

THOMAS LOCKYEAR says—"I was so deaf that I could not hear St. Thomas's Bells (a very powerful peal), and as to going to Church, it was no good at all, for I could not hear a word. After using 'Orchard's Cure for Deafness' I was quite restored, and last Sunday heard every word at Church."

1s. 14d. per Bottle. Free by post for 14 stamps from EDWIN J. ORCHARD, Chemist, SALISBURY.

## DYSENTERY.

### ITS HYGIENIC TREATMENT.

DYSENTERY is usually a disease of warm malarious climates, though not altogether absent in the warm season from temperate regions. Sometimes it is epidemic, and probably it is then contagious or infectious, in which case it must have its cause in some micro-organism in the food or water. Its seat is in the large intestines, more usually in the lower part of the colon. It causes congestion, and if severe, ulceration with much pain and fever. There is a diarrhoea and the discharges are bloody. This originally gave the name bloody-flux to the disease. In former times the treatment was to give castor oil, laudinum, Dover's powders, brandy, starch injections, and other similar remedies, but the mortality from this treatment was often very great. Modern hygienic methods are far more successful. They consist in first cleansing the colon by tepid or quite warm water injections given very slowly and as copious as can be borne, the patient lying on the left side. To give the water an antiseptic character a little salt may be used, say a teaspoonful to a pint of water. After the intestine has been thoroughly cleansed frequent cold injection may be used but do not employ much water at a time—a little and often should be the rule. Clothes wet in ice water should be laid over the abdomen and changed as often as they become warm. The fever may be kept down by sponging, or a full bath if the patient is not weak. Perfect quiet in bed should be observed. The food should be liquid and the juices of stewed black-berries with sugar may be used freely, or other acid fruits, if more agreeable. They are sufficiently nourishing. Dysentery is usually caused by heat, impure water, bad food, and an unclean condition of the intestines. It rarely occurs in families whose habits are hygienic.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

**PHRENOLOGY.**—Could any correspondent inform me as to whether there is a phrenologist in or near North London?—*A. N. Trebarne.*

**EAST COAST.**—Will any reader kindly suggest a quiet seaside place to spend a fortnight's holiday? The East Coast preferred, where bathing is good and the air bracing.—*L. S.*

### ANSWERS.

**SUMMONS.**—The summons should certainly contain your surname. However, as you have no doubt that it was intended for you, we advise you to appear in answer to it. It was duly served, and the judge has power to amend the mistake in your name on whatever terms he thinks just. You say you have a good defence on the merits; what good purpose would your refusal to appear under the circumstances serve? It is easy enough for her to ascertain your right name, so she would merely, if necessary, have to take out another summons in your right name.

**BIRLEY'S PREPARATIONS.**—"G. A. P."—We have forwarded your letter to the proprietors.

## GIFTS FOR BAZAARS.

A Free Parcel of SOUTHALLS' "SANITARY TOWELS" will be sent Carriage Paid to the first Lady Stall Holder of every Bazaar who applies to THE LADY MANAGER, 17, Bull Street, Birmingham, mentioning this paper, and enclosing circular with list of stall-holders.

**SOUTHALLS' "SANITARY TOWELS"**—the greatest invention of the century for Woman's Comfort, at the cost of washing only.

May be obtained from Ladies' Outfitters, Drapers, and Chemists throughout the world, in packets of one dozen. Size 1, 1s.; Size 2, 1s. 6d.; Sizes 3 and 4 (differing in shape), 2s.

ALSO POST FREE FROM THE LADY MANAGER FOR 1/3, 1/9, and 2/3.

**SOUTHALL BROS. & BARCLAY, BIRMINGHAM.**

WHOLESALE AGENTS—SHARP, PERRIN, AND CO., 31, Old Change, London, E.C., and STAPLEY AND SMITH, London Wall, London, E.C.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 200 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, etc. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

## ADVICE GRATIS.

BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a *Postal Order* for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than *Thursday*, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on *Friday*. The answers to these will therefore appear in the issue of *Saturday week* following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

## The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:-

University College Hos-	mersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box - Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

R. ARCHER, JUN.—Your deafness is due, in all probability to obstruction of the eustachian canal. Before your hearing can be restored, it is necessary that this difficulty be removed, and that will need the use of the eustachian catheter. You had better, therefore, go again to the same or some other ear hospital, where this can be done for you at proper intervals by an experienced surgeon. It would be quite impossible—and if possible, it would be dangerous—for you to attempt the operation on yourself. We do not know the address of the gentleman named in your query.

DONIVON.—You have no occasion for worry. The condition only came on at Easter, and you commenced your swimming just about that time. It is easy to connect this cause and the effect described. You do not require any treatment of any kind whatever, except that you should take care to keep your bowels freely open and to make your mind easy on the score of disease.

## EYESIGHT PRESERVED.

MR. AITCHISON, Oculist Optician, should be consulted in all cases of Defective Vision 47, FLEET STREET, LONDON, E.C.

Seventh Edition 5s., Epitome 1s., post free.

## URINARY DISEASES.

By DAVID JONES, M.D., Surgeon to the Hospital for Stone, &c., 10, Dean Street, Soho, London. Diagrams illustrating the Removal of Stone without Cutting, and Cure of Enlarged Prostate and Stricture by the Spray Treatment and Electrolysis, with interesting cases and indisputable references. Apply to Clerk.

A Valuable Book of Hygienic and Surgical Appliances, contains Valuable Information for all Married Persons, Sent Free on receipt of Stamped Addressed Envelope by

FREE. E. D. LAMBERT & CO., 44, MAYFIELD ROAD, DALSTON, LONDON, N.E.

PADDY.—We are disposed to agree with you that the pains are due to rheumatism. We should advise you to take more outdoor exercise; to avoid sugar, coffee, beer, preserve, foods, and pastry. Take a smaller quantity of meat, and a larger proportion of green vegetables and fruit, as well as fish, three times a week. The following medicine will help you: Sulphate of soda a scruple, bi-carbonate of potash fifteen grains, tincture of henbane twenty minims, tincture of gentian twenty minims. Water to half an ounce; three times daily between meals. A mustard leaf applied to the seat of pain for twenty minutes will be of much service.

HONOR.—It is a misfortune that you have thrown away so much money on useless so-called treatments. You would have done better to have consulted a properly qualified medical man at the outset. In reply to your questions: 1. These spots are found in nearly everybody, and are of no consequence. 2. Take the following mixture night and morning, giving up your laudanum taking at once: Bromide of potassium twenty grains, tincture of hops half-drachm, water to half an ounce. The conditions you describe are common to most young men of your age, and you need not worry yourself unnecessarily about them. If after taking the above for a month you do not find much improvement, write us again, re-stating your case.

ANXIOUS.—The person named is not qualified to practise in this—nor, as far as we know, in any other country. He is what you suspect, and you will do wisely to avoid him. You had better consult a properly qualified physician, with special experience of these diseases, as from the somewhat unusual history of the case, a personal examination of the parts will be necessary before prescribing for the condition. Meanwhile, do not take so serious a view of the state of affairs as you appear to be doing, and if we can advise you further, do not hesitate to write again, restating the case in full.

WESTMINSTER.—We should advise you to postpone the marriage under the circumstances. Take up some hobby, such as we do not much care to answer, and in any case there is no such thing as absolute safety in the rule you mention, 1 and 2. Four days preceding and subsequent.

A. WALTERS.—The symptoms described are unfortunately not at all uncommon, and generally need very careful treatment. At present it would be unwise of you to think of marriage, but possibly in six months or so it may be that a more satisfactory state of health may admit of your entering the conjugal state. Just now, you must learn to pass a bougie (No. 9 English) twice a week—the chemist will tell you how to manage it—and take the following mixture twice daily for a month: Dilute phosphoric acid ten minims, tincture of nux vomica five minims, bromide of potassium fifteen grains, water to half an ounce. Keep the bowels free. Take fish at least three times weekly; walk five or six miles a day, and indulge in a cold bath as frequently as convenient.

INQUISITIVE.—Keep your bowels acting regularly by a morning dose of sulphate of magnesia, one teaspoonful or less in a little water; learn to pass a bougie (No. 10 English) twice a week, retaining the instrument in position for two min. ten each time. Eat your food slowly. Take up some hobby, such as gymnastics, cycling, or football; read works of travel, biography, or science, and every night and morning swallow a dose of the following mixture: Bromide of ammonium twenty grains, tincture of hops half-drachm, tincture of henbane fifteen minims; tincture of gentian twenty minims; water to half an ounce. We do not think your case by any means severe, and have every reason to think you will recover after a time.

A SUFFERER (H).—Without some further description of the enlargement, it is impossible to state the cause of it. In all probability your surmise is correct and possibly the condition may yield to treatment. The palpitation of the heart and the pains are due in part to indigestion, in part to the nervous condition. Your liver is also deranged temporarily. For the present you must certainly refrain from taking either port wine or stout, as they are much more likely to increase your troubles than to be of any service to you. You must manage somehow to take more exercise, to eat your food slowly, to take no sweets in any shape whatever. Try also the effect of a dose of the following mixture taken regularly before each meal: Dilute hydrochloric acid ten drops, sulphate of benzoin twenty grains, tincture of gentian half a drachm. Water to half an ounce.

PERPLEXED.—We do not wonder at your suffering from this discharge under the circumstances named. The repeated irritation of the parts within so short a time would be quite sufficient to induce a similar condition in any body, however healthy. You must give up all bad habits at once: take a cold bath daily or bathe the parts with cold water twice a day, and take the following medicine: Bromide of sodium twenty grains, tincture of hops half a drachm, tincture of gentian twenty minims. Camphor water to half an ounce. It does not appear that you have caught any infectious disease.

CITWOLD.—We have no knowledge of the advertised remedy but judging from our somewhat extensive experience of similar puffs we should advise you to keep clear of it. The only treatment likely to be of service is massage skillfully applied, together with the use of fresh formers such as Frame Food, cream, eggs, and so on.

CEDE DEO.—You have indigestion, constipation, and piles. You do not take enough exercise, and should endeavour to be in the open air at least two hours each day. The whole of the difficulties are due to these causes and they should be no real trouble in obtaining prompt relief. Bathe the parts twice a day with cold water, take one of these pills every day with dinner, and a dose of the medicine each morning before rising: Blue pill one grain, compound rhubarb pill two grains, in pill. Sulphate of magnesia forty-five grains carbonate of magnesia ten grains, nitrate of potash five grains, peppermint water to half an ounce. To make a mixture.

THAME.—Your general health is depressed. The discharge is not what you suppose it to be, and is not of any consequence. You had better take the following mixture three times a day between meals: Bicarbonate of potash fifteen grains, sulphate of magnesia half a drachm, tincture of henbane twenty minims, infusion of buchu to half an ounce. Bathe the parts every day with cold water, and should there be no improvement let us hear again from you in a month's time.

TROUBLED SISSEY.—The only method known to us of preventing these losses is to avoid every possibility of excitement. You can very easily do this if you make up your mind to it. Further, you may bathe the parts twice or three times daily with cold water; and three times a day take the following mixture: Bromide of potassium twenty grains, tincture of hops half drachm, camphor water to half an ounce.

D. O. M.—You ask us to recommend a cure for a habit. How can we do that? If you will describe to us the conditions for which you seek relief, we shall be very happy to help you as far as possible. Meanwhile make up your mind to give up the habit at once.

HAMMERSMITH.—It is not unusual to find similar conditions of weakness following influenza. But your letter suggests that you are also suffering from indigestion. You should, therefore, eat your food slowly, avoiding coffee, sugar, preserved foods, and other indigestibles. Drink only after meals, take a reasonable amount of out-door exercise, and take the following mixture three times daily: Subcarbonate of bismuth ten grains, mucilage of acacia half-drachm, tincture of nux vomica six minims, chloroform water two drachms; water to half an ounce. If you smoke, give up the habit, and become a total abstainer if you are not one already.

NIL DESPERANDUM.—1. Cause, acid urine, due to indigestion with sympathetic liver disturbances. 2. See reply to "Hammersmith" in these columns, follow the directions there given, and take the following medicines: Pill of colocyath and henbane three grains, compound rhubarb pill two grains, daily with dinner. One teaspoonful of sulphate of soda in water each morning before rising. We shall be glad to hear the result.

W. J. W.—Yes. You would do well to consult a doctor as you suggest. Half-an-hour's conversation with a physician habitually treating such cases would probably put you altogether on the right road. In any case, you must look more carefully on the state of things, for there are very many patients with more definite symptoms than yours who get perfectly well under proper treatment. But you must avoid advertisers such as those named.

ETITNA.—You have most likely an abscess surrounding a portion of the diseased tooth. Your best plan will be to have the tooth extracted without delay. No other treatment can be efficacious in removing the difficulties of which you complain.

RENA.—We are sorry to be unable to give you the name and address of a specialist physician in these columns. If you forward us a stamped addressed envelope restating your request we shall be happy to comply with it.

J. W.—Protrusion of the womb, and constipation, with resultant congestion of the parts, are the causes of the troubles of which your wife complains. She will need to lie upon her back for two hours each afternoon; to keep her bowels acting regularly with a daily dose of one teaspoonful (or less) of compound liquorice powder; to bathe the parts daily with cold water and soap, and after drying thoroughly to anoint them with the following ointment: Pure creasote twenty drops, red oxide of mercury six grains, oxide of zinc one drachm, vaseline two ounces.

FALKA.—Quinine and iron is about the last thing in the world we would suggest in your case. On the contrary, you require quite different treatment. Take the following pill every night: Pill of colocyath and henbane four grains, extract of nux vomica quarter grain, and this mixture twice a day between meals: Bicarbonate of potash twenty grains, sulphate of potash twenty grains, infusion of buchu to half an ounce. Give up all beer and spirits, and drink no coffee. Take neither sugar, eggs, nor preserved foods.

INCH.—You have catarrh of the pharynx-respiratory tract. Your plan will be to use an inhalation of the compound tincture of benzoin, twenty drops to a pint of boiling water, several times a day. Avoid exposure to sudden changes of temperature; give up the habit of expressing the mucus, as you say you do. Keep the bowels acting freely; give up smoking; eat your food slowly, and be careful not to indulge in indigestible foods of any kind whatever.

WHEAT PHOSPHATES NOURISH BRAIN and FRAME.

WHEAT PHOSPHATES FORM BONE, TEETH, and MUSCLE.

WHEAT PHOSPHATES ENRICH the BLOOD.

FRAME FOOD CO., LTD., LOMBARD ROAD, BATTERSEA, LONDON, S.W.

# "MALT-COFFEE"

(PATENTED.)

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Dose not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much farther than any ordinary coffee; therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin. MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

**KAIRNEY.**—We know of no preparation superior to that so'd by Mr. Clarkson. Even the best, however, is apt to impair the quality of the skin at the consequences.

**CHAS. JACKSONS.**—The reply to your question must depend entirely upon the nature of the course of medication that you have undergone. Will you, therefore, please tell us exactly what you have taken, in what quantities, and for how long? It may be advisable, under certain circumstances, that you should take a short special course of treatment preparatory to marriage, but we shall be able to advise you on hearing the particulars named.

**CHATELAIN.**—Keep your hair cut closely as possible; wash the scalp twice a week with soap and hot water, rinsing afterwards with cold water; dry thoroughly, and apply the following lotion with a sponge to the roots of the hair: Blistering fluid four drachms, tincture of capsicum four drachms, glycerine eight drachms; rose water to six ounces.

**WRETCHED.**—Neither of the appliances named can be of any possible service to you. You had better therefore save your money rather than throw it away as you have done already. Take as much exercise as possible; indulge in a daily cold bath, especially for the local parts; and take the following mixture regularly three times a day for a month: Bromide of ammonium twenty grains, citric acid ten grains, tincture of nux vomica ten minims, water to half an ounce. Have patience, and you will be and by feel much better, and possibly recover entirely from the effects of former bad habits.

**JEAME.**—Give up vegetarianism, which does not suit you, any more than it does other people. It is a bad, calculated to do a very great deal of harm, especially to young people of your age. Bathe your eye with the following lotion several times a day: Boracic acid twenty-four grains, glycerine two drachms, extract of opium six grains, rose water two ounces, distilled water to six ounces. Keep your bowels free, and do not sleep in a draught.

**EDDERLY.**—Cause, indigestion. Eat your food slowly, and take the following mixture an hour after each meal: Dilute sulphurous acid half drachm, sulphate of magnesia twenty grains, compound tincture of cardamoms half drachm, tincture of gentian twenty drops; water to half an ounce. Drink no tea, give up all stimulants, take a reasonable amount of exercise, and think as little about your trouble as possible.

**MINNIE.**—You are suffering from physiological acne, but you tell us nothing as to your diet, occupation, general health, &c. See advice given to "Hammersmith" in these columns. Wash your face in hot water, using only some good soap, such as vinolia or tenebe. Rub the face thoroughly after drying, and bathe it afterwards with elder flower water.

**JAS. BURTON.**—Probably the injury is a sprain consequent on lifting the furniture, and has nothing to do with the blow received. Had a vein been ruptured there would have been evidences under the skin of such an accident, none of which, however, appear to be present. Your best plan will be to soak the arm twice a day in hot water for twenty minutes at a time, rub the part gently towards the shoulder, using on the operating hand the following liniment: Glycerine of belladonna one ounce, soap liniment twelve drachms. Keep the bowels free, and do not use the left hand more than you can help for the present.

**II. PRESTON.**—The recipe already sent you covers all you ask for, it is not only good, you mean of removing what you call the roughness (glycerine), but it also gives you the proportion of quinine, one ounce in twenty-nine. Twenty drops in a wineglassful of water for a dose. Why did you not take the prescription to a chemist who would have explained the whole thing to you?

**ST. KILDA.**—No, the treatise is worthless. The only method we know that can be of any service in such a case is that of treatment by electricity. That can only properly be practised by a qualified medical man, who has also a substantial knowledge of electricity, and the modes of applying it in such cases. Medicines alone, we fear, would be of no service.

## A WONDERFUL MEDICINE.

# Beecham's Pills

ARE universally admitted to be worth a Guinea a Box for Bilious and Nervous Disorders, such as Wind and Pain in the Stomach, Sick Headache, Giddiness, Fulness and Swelling after Meals, Dizziness and Drowsiness, Cold Chills, Flushings of Heat, Loss of Appetite, Shortness of Breath, Costiveness, Scurvy and Blisters on the Skin, Disturbed Sleep, Frightful Dreams, and all Nervous and Trembling Sensations, &c. The first dose will give relief in twenty minutes. Every sufferer is earnestly invited to try one Box of these Pills and they will be acknowledged to be

## WORTH A GUINEA A BOX.

For females of all ages these Pills are invaluable, as a few doses of them carry off all humours, and bring about all that is required. No female should be without them.

For a Weak Stomach, Impaired Digestion, and all Disorders of the Liver, they act like magic, and a few doses will be found to work wonders on the most important organs in the human machine. They strengthen the whole muscular system, restore the long-lost complexion, bring back the keen edge of appetite, and arouse into action with the rosiest of health the whole physical energy of the human frame. These are FACTS testified continually by members of all classes of society, and one of the best guarantees to the Nervous and Debilitated is BEECHAM'S PILLS have the Largest Sale of any Patent Medicine in the World.

## BEECHAM'S MAGIC COUGH PILLS.

As a remedy for Coughs in general, Asthma, Bronchial Affections, Hoarseness, Shortness of Breath, Tightness and Oppression of the Chest, Whooping, &c., these Pills stand unrivalled. They are the best ever offered to the public and will speedily remove that sense of oppression and difficulty of breathing, which nightly deprive the patient of rest. Let any person give BEECHAM'S COUGH PILLS a trial, and the most violent Cough will in a short time be removed.

Prepared only and sold Wholesale and Retail, by the Proprietor, Thomas Beecham, St. Helena, Lancashire, in boxes 9d., 1s. 1d., and 2s. 9d. each.

Sold by all Druggists and Patent Medicine Dealers every where.

N.B.—Full directions are given with each box.

**IGNORAMUS.**—Avoid both brandy and port wine, especially the latter, except where absolutely necessary through faintness. Take instead strong black coffee without sugar or milk, with a crust of toast or a dry biscuit. When on board make a point of living on your back whenever you fell at all sick.

**YOUR FRIEND.**—For your sister, see that the ends of the hair are regularly clipped once a fortnight. Let the head be washed once a week. Avoid the tongs and allow Nature to do the rest. For yourself, you are probably suffering from varicella, and the lips are subject to attacks of herpes. Take a teaspoonful of sulphate of magnesia in water every morning before rising; touch the lips with eau de Cologne frequently when the spots begin to form; and be careful to avoid indigestible food at all times.

**MINERVA.**—See reply to "Hammersmith" in these columns. The reply to all the questions is "yes." You are extremely nervous, and we would suggest in addition to the medicine prescribed for "Hammersmith," that you should, each night at bedtime take twenty grains of bromide of potassium in water. With regard to the sal volatile, our advice is leave it alone.

**TROUBLED ONE.**—You are suffering from indigestion, with its concomitants. See advice given to "Hammersmith" in these columns, and take before each meal the following mixture: Dilute hydrochloric acid ten drops, tincture of nux vomica ten drops, chloroform water two drachms, water to half an ounce.

**CONTEMPLATING MARRIAGE.**—You have nothing to worry about. Leave well alone, and cease to bother yourself about what is practically of no consequence. Of course, you should avoid unnecessary excitement, and keep the bowels acting, but further than that you need not distress yourself.

**J. BAKER.**—See reply to "Wretched" in addition you must learn to pass a gum elastic bougie (No. 9 English) twice a week, retaining it in position for two minutes. The chemist from whom you buy the instrument will show you how to use it.

**ANDREW.**—1. Three or four times a week during that period; less frequently afterwards. 2. Persevere with your cold bath, take plenty of exercise, and the following mixture three times daily for the next six weeks: Dilute phosphoric acid ten minims, bromide of sodium fifteen grains, tincture of nux vomica eight drops, bitter infusion to half an ounce. We cannot see that you have any occasion to worry yourself.

**ADA LINCOLN.**—Take one of the following pills every day with dinner and supper: pill of aloes and iron three grains; and the following mixture night and morning: Bromide of potassium fifteen grains, fluid extract of black willow half a drachm, camphor water to half an ounce.

**ULCERATED.**—You should have gone on with the medicine which did you so much good for at least twelve months after the ulcer had healed. It will be much more difficult now to do you good, but you may try the following plan: Keep the leg raised above the body for several hours a day, by lying on a couch, the lower end of which is elevated four to five inches. Apply some calomel ointment, diluted with an equal part of vaseline, and take the following mixture: Iodide of potassium two drachms, glycerine one ounce, compound tincture of bark one ounce, water to eight ounces. Take one tablespoonful with an equal part of water three times a day, and write us again in two months.

**J. J. CRAIG.**—Yes. Flatulence is the cause of the pain. Half-an-hour after every meal take the following mixture: Dilute sulphurous acid half drachm, compound tincture of cardamoms one drachm, tincture of gentian half drachm, water to half an ounce.

**DEMOSTHENES.**—You are suffering from hyperaesthesia of the parts, the consequence of former bad habits. You would do wisely to consult a specialist physician on the matter, with a view to electrolytic treatment. Meanwhile take a scruple of bromide of potassium every night and morning in a wineglassful of water. Keep the bowels acting freely, and take as much exercise as possible. We should not advise you to marry until you have undergone a course of treatment.

**II. L. J.**—Yes. A properly made and properly fitted elastic stocking should be of great service to you. But you must be careful that it is not too tightly fitted above the calf. Under the circumstances, we do not see what other course you can follow.

**A CONSTANT READER.**—The genuineness or otherwise of the powder depends upon the purity of the ingredients. The weight is a secondary matter, but it is advisable to make the preparation of the ordinary weight in order that its action may be effectual. No doubt you will find what you require in "The Physician," which contains many good recipes. You can obtain it at the FAMILY DOCTOR Office, 18, Catherine-street, Strand, W.C., post free 1s. 1d.

**DOUGLAS.**—There is no remedy better than "time" for the trouble of which you complain. You may assist by using a lotion containing glycerine one ounce, rose water two ounces, elder flower water three ounces. Th be applied to the affected parts four or five times a day.

**W. A. HUTCHISON.**—Indigestion with sympathetic liver disturbance will account for the troubles. See the reply to "Hammersmith," in these columns, and follow carefully the directions there given.

**TUTOR (OXFORD).**—1. No medicine will accomplish that which depends solely upon the will of the sufferer. Twenty grains of bromide of potassium in half an ounce of camphor water twice a day will help. 2. You should have a slight operation performed to cure the phymosis, and prevent the accumulation of secretion (emegma preputialis). 3. No. 11 is not safe to undertake active treatment of the kind named. That should only be done by a properly qualified physician.

**II. S.**—Take twenty grains of bromide of potassium in half an ounce of camphor water night and morning. Take as much out-door exercise as possible.

**V.F.P.**—Take moderate out-door exercise, and continue the use of the mixture already prescribed for you. You cannot do better, but patience will be necessary.

**THOMAS BERRY.**—No. There is no necessity to change the medicines ordered for you. Persevere for another month; then, if you still feel out of sorts, write us again, giving all the particulars of your case.

**J. P. WYNER.**—Take the following mixture three times daily before meals: Dilute phosphoric acid ten minims, sulphate of magnesia twenty grains, sulphate of quinine two grains, tincture of nux vomica ten drops, water to half an ounce. Take a daily cold bath or at any rate bathe the parts affected with cold water as frequently as convenient.

**E. A. L.**—Take syrup of iodide of iron half a drachm, solution of magnesia two minims, water to half an ounce. Three times daily after food. Rub into the parts iodide of potassium ointment, each night after bathing well with hot water and soap.

**GARDNER.**—Your liver is your chief trouble. You had better take every morning a dose of the following medicine: Sulphate of magnesia one and a half drachms, carbonate of magnesia ten grains, nitrate of potash ten grains, peppermint water to an ounce. Take as much exercise as possible and cease to think about your troubles, which are not so serious as they appear to you to be. Keep on with this medicine for three months, then write to us again.

**EARLY CONTRIBUTOR.**—Your weight is much less than it should be considering your stature. The symptoms described may indicate not only the troubles named, but certain others which need attention. You would probably do wisely to take a little stout (one pint a day); but we cannot say that stimulants make much difference in the tendency to catch cold. We are sorry we cannot give the name and address of the medical man in these columns, but if you enclose a stamped and addressed envelope stating your wish, we shall be happy to send it to you by post.

**E. S. D.**—You have forgotten to tell us the cause of the enlargement of the joint. Have you met with an accident? Do you suffer from gout or rheumatism? Have you worn ill-fitting boots at any time? Please give us answers to these questions, and meanwhile rub the part daily with new whiskey, and keep the bowels regular.

**WM. DAWSON.**—Every day at dinner-time take the following pill: Pill of colocynth and henbane three grains, compound rhubarb pill one grain. Every morning before rising, one teaspoonful of powdered sulphate of soda in a wineglassful of water. Give up coffee, sugar, pastry, and eggs.

**ANXIOUS SWIFT.**—You must really give us some further details of your condition, to enable us to make a diagnosis. If you will describe your troubles fully, stating your age, h occupation, diet, &c., we shall be in a better position to give you our advice.

## The New Non-Poisonous Disinfectant.

“IZAL”

“IZAL” instantly destroys Infection in its most dangerous and virulent forms, stops Cholera, Smallpox, Diphtheria, Influenza, Scarlet, Typhus, and Typhoid Fevers, and is a sanitary necessity and protector for the sick-room, nursery, household, hospital, and in public. Its disinfecting properties are enormous, and as a destroyer of disease germs it possesses antiseptic power greater than pure Carbolic Acid. No offensive smell can exist near it. It can be used for all disinfecting purposes the same as with the old-fashioned Disinfectants—Being *non-poisonous* it is safe under all conditions—Being *non-caustic* it will not numb the hands or irritate the skin, and is invaluable for washing wounds and in surgical dressings. Being *non-corrosive*, it will neither stain nor injure linen, bedding, clothing, carpets, hangings, furniture, metals, or surgical instruments. CAN BE USED WITH GREAT ECONOMY. Sold by Chemists and others in large bottles, 1s., 2s. 6d., and 4s. 6d., and Gallon Tins, 10s. Sample bottle or tin sent Carriage Free, in the United Kingdom, for Postal Order.

The Gallon Tin will make 200 Gallons of powerful Germ-destroying disinfectant, costing less than One Penny per Gallon.

Sole Manufacturers: NEWTON, CHAMBERS, & Co., LTD., THORNCILFFE, SHEFFIELD. London Offices: 19, Great George Street, Westminster; and Thornecliffe House, 331, Gray's Inn Road, W.C.

The IZAL Pamphlet, containing simple rules for the Protection of Life and Health, sent Post Free.

## PETERMAN'S COCKROACH AND BEETLE FOOD.—Great Reduction in Price.—

1 Shilling Tin, 9d.; 2 Shilling Tin, 1s. 6d.; 4 Shilling Tin, 3s. PETERMAN'S C. & B. FOOD is the only NON-POISONOUS preparation that ACTUALLY KILLS Cockroaches and Beetles. It attracts them, they eat it and are dried up to a shell. In quantity as well as quality this is now the cheapest article in the market. J. F. SHOKEY MANUFACTURING CHEMIST, 67, FARRINGTON ROAD, LONDON, E.C.

# ONCE IN SIX MONTHS NOT ENOUGH.

**T**WICE a year, at least, it has got to be done. Every house-keeper knows it. Carpets must be taken up and beaten, floors scrubbed, paint washed, walls white-washed, holes and corners overhauled and purified, useless odds and ends turned over to the ragman or the dustman, and the house made clean, neat, and orderly for another six months. Good old custom! It defines the difference between the homes of civilised human beings and the huts and caves of savages. But some parts of the house ought to be cleansed every day. Dirt is our worst enemy. Let us not allow him to have things all his own way for months.

There is one house, anyhow, which must be kept clean all the time. The regular Spring and Autumn scouring isn't enough. The house may be rotted down and the tenant dead before that.

A famous physician says: "Intelligent men and women will go to all the trouble and expense of driving away dirt when it is where they can see or smell it, yet seem to have no idea that an enormous quantity of foul, rotten, and abominable matter exists within their bodies—the seeds of disease and premature death."

The doctor is quite right, but why don't people understand it? Because they have never been taught what "disease" really is. They think of it as something to "catch," a sort of mysterious thing which comes and goes like gusts of wind in the tree tops. Yet disease—no matter what a lot of hard names the medical men call it by—is simply the effect of impurities that get inside of our bodies—*dirt in the most wonderful and complicated house that was ever built.*

Now, how does the dirt get there? How can we clean it out? Two questions right put to the point—both of them. Let us see.

Lying on our table as we write are more than fifty letters, all on the same subject, and all saying the same thing. We pick up the first that comes to hand. It is from a woman, and we will tell you the substance of what she says. Away back in February, 1886, she was taken ill. Exactly what ailed her she couldn't tell. But that she felt weak, low, and miserable was certain. For one thing, she had a hacking cough that shook and tired her and broke up her sleep.

Often, particularly in the morning, a sour, bitter stuff came up into her throat and mouth, and half choked her. Her tongue was covered with fur, and her mouth tasted badly, a sickening taste that made her shudder and shiver with disgust as one would

at a mouthful of mouldy, wormy biscuit. Even good food had no charms for her; everything had lost its relish. No sooner did she swallow a bit of bread or meat than it gave her a dreadful pain at the chest and sides, as though it had lodged in the wrong place. Then there was the phlegm that gathered all the while, and compelled her to weary herself out with hawking and straining to get it up. Well, we needn't go much farther into the details. Almost everybody who reads these lines has suffered the same way, or knows others who have. The lady grew weaker, of course. What else could be expected? No nourishment, no strength. That's the law for us all—from kings to coal-heavers. A doctor gave her his opinion and his medicine. She tried the latter for two months, then stopped. What's the sense of going on taking drugs that make one feel no better? None, to be sure; it's a waste of time and money. And money is too hard to come by to throw away for no good.

By this time our friend could barely walk about, and if help didn't come soon she wouldn't be able to do even that. Merciful Goodness! how many thousands of women there are in dear old England in precisely this pitiable shape this blessed minute. Well, thank Heaven, some of them hear the good news every day that dawns.

"In June," says this one, "I read the wonderful little book that tells of Mother Seigel's Curative Syrup. I got the medicine from Mr. F. Mays, Chemist, Friars Street, Reading, and found relief in a few days. I continued taking it, and was soon in good health. Yours truly (Signed), Mrs. Mary Skeate, St. Leonard's Square, Wallingford, Berks, November 25th, 1892."

Constipation, indigestion, and dyspepsia were the cause of all the mischief. From the dull and torpid stomach, from the sour and fermented food, went forth the impurities which filled the blood and set up pain and misery. That, and nothing else, was the trouble, and *that* is always the trouble. What makes it? Uncleanliness, ladies. Pardon us, but you want the truth. If, with Mother Seigel's help, you will keep the interior of your *bodies* as clean as your *parlours*, you won't write such sad letters.

Clean house, then keep it clean. Not once in six months; but gently, sensibly, all the while. When you *feel* the dirt (you can't see this kind) wash it out at once. The human body is God's temple, the Bible says.

## FITS! FITS! FITS!

ALL PERSONS SUFFERING FROM  
**EPILEPSY**

Should send name and address to JAMES OSBORNE, Medical Pharmacy, Ashbourne, Derbyshire, who will forward, free of charge, full particulars, with testimonials, of the most successful remedy ever discovered for this distressing malady. Sent to all parts of the world.

## ECZEMA.

SIR,—After TEN YEARS suffering and irritation your "VELVETA" has cured my leg. It has been worth **TWENTY POUNDS** to me.—JOHN JARVIS FOVANT.

"VELVETA," a beautiful Cream for Eczema, and all roughness of the skin. 13d., or by post 15 stamps from E. J. ORCHARD, Chemist, Salisbury. Please mention this paper.

## GREY WHISKERS, &c.

To Permanently Restore the COLOUR in two hours, True to Nature, send for a bottle of

**COURTICE'S CONCENTRATED EXTRACT OF NUT GALLS.**

This is not a dye, is applied in two minutes, and does not stain the skin. Of all Chemists, or direct from GEO. COURTICE, 234, Strand, London. Post paid, 3s. 9d. To LADIES the EXTRACT is INVALUABLE for Restoring the Colour close to the skin, and can be used with any other restorer. Try it.

## CHILDREN TEETHING

Have all their troubles relieved by taking

**DOCTOR STEDMAN'S TEETHING POWDERS**

Absolutely free from Morphia or Opium.

TRADE MARK A GUM MARK. TRADE MARK LANCET.

1s. 11d., and 2s. 9d. per packet. Manufacture: 125, New North Road, Hoxton London, N.

**COLWELL'S PERFECT-FITTING TRUSSES.** Estb. 1832. All kinds made, 3s. 6d. to 21s. Elastic Stockings, 3s. to 10s. Ladies' Belts, &c. Mrs. Colwell attends ladies. Catalogue post free.—HY. M. COLWELL, 116, Newington Causeway, S.E.

**FREEMAN'S ORIGINAL CHLORODYNE.** Sold by all Chemists and Patent Medicine Dealers in all parts of the World.

This important and valuable Medicine discovered and invented by Mr. Richard Freeman in 1844, introduced into India and Egypt and all over the World in 1860, maintains its supremacy as a specific remedy for the treatment and cure of Coughs, Colds, Consumption, Bronchitis, Asthma, Ague, Sore Throat, Influenza, Neuralgia, Diarrhea, Dysentery, Asiatic Cholera, Colic, Gout, and all fevers, 1s. 1d., 2s. 9d., 4s. 6d., 11s., 20s., per bottle, post free. N.B.—Lord Chancellor Selbourne, Lord Justice James, Lord Justice Mellish, decided in favour of FREEMAN'S ORIGINAL CHLORODYNE and against Brown and Davenport, compelling them to pay all expenses in the suits.—See Times, July 24, 1883. Reject substitutes.

## OLD SHIRTS REFITTED.

Hand knit by Donegal peasantry. Warm, durable, comfortable. Two pairs Men's size sent post free, 2s. 6d. Knicker Hose, two pairs free, 3s. 9d., 4s. 9d., 5s. 9d., 6s. 9d., 7s. 9d. WOOL PANTS and VESTS are now very cheap. Price lists and patterns. Cambric Handkerchiefs and all kinds linen goods free.—B. & E. M'HUGH, Limited, BELFAST.

## TO THE AFFLICTED.

FOR 23 stamps, a sufficient supply of Lady St. John's Samaritan Salve to cure any ordinary cases of Bad Legs, Bad Breasts, Tumours, Ulcers, Cancers, &c., however long standing; Erysipelas, Burns, Piles, & Skin Diseases.—J. QUEMBY 324, Wandsworth-road, London. Trial Box, 9 stamps. All Chemists.

## THE PHYSICIAN:

A FAMILY MEDICAL GUIDE, CONTAINING

UPWARDS OF 250 RECIPES

FOR THE

PREVENTION, TREATMENT & CURE

OF NEARLY

ALL THE ILLS INCIDENTAL TO THE HUMAN FRAME,

WITH ADVICE TO THE HEALTHY; RULES FOR THE SICK; TABLES ON DIGESTION, &c. ALSO,

## A TREATISE ON CONSUMPTION

By EMINENT PHYSICIANS,

Carefully copied from the Prescription-Book of a London Chemist of Thirty Years' Experience.

"FAMILY DOCTOR" PUBLISHING CO., 18, CATHERINE ST., STRAND, W.C.

Price One Shilling by Post 1s. 1d.

**SAVE YOUR LIVES BY TAKING**  
**OWBRIDGE'S LUNG TONIC,**  
THE MIGHTY HEALER,  
It has a power over diseases hitherto unknown in medicine.  
Are you at all Weak-chested or inclined to be Consumptive, with just a touch of cough now and then?  
"Try this Wonderful Medicine."  
The Cough and Weakness will disappear as if by magic, and you will feel a strength and power you never had before.  
**HAVE YOU A COUGH?**  
**A DOSE WILL RELIEVE IT.**  
**HAVE YOU A COLD?**  
**A DOSE AT BEDTIME WILL REMOVE IT.**  
Bronchitis and Asthma it relieves instantly.  
The Spasms of Coughing so dreadful in Whooping Cough becomes less with each dose of the medicine.  
Prepared by W. T. OWBRIDGE, Chemist, Hull.  
Sold in Bottles 1s. 11d., 2s. 9d., 4s. 6d., and 11s., by all Chemists and Patent Medicine Vendors.  
Wholesale, all London and Provincial Wholesale Houses.

"FOR THE BLOOD IS THE LIFE."

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scurfs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

THOUSANDS OF TESTIMONIALS  
FROM ALL PARTS OF THE WORLD.

## EDITORIALS.

**TAKE CARE OF YOUR EYES.**—The way people abuse their eyes is amazing. They try them, strain them, and overtax them in all manner of ways. And when their eyes begin to weaken with ill-usage and age they are too proud to give them the aid of glasses, which they crave. Furrowed cheeks, sallow complexions, and white hair can be hidden under enamel and rouge and dyes, but there is no fashionable nostrum that can cover up weakness of eyes. Spectacles proclaim the defect which they mitigate, and are looked upon by those whose minds are as weak as their eyes as a badge of infirmity, and sooner than saddle their noses with them they saddle their lives with semi-blindness.

**BE** careful to avoid excess in eating. Eat no more than the wants of the system require. Strength depends not on what is eaten, but on what is digested.

**WE** must make the keeping of ourselves in health both a duty and a privilege. Health is so much a measure of our capacity for work, and work is so much the only thing we can do for human welfare and holy service, that it behoves us to use this talent as not abusing it.

**BATHING.**—Weak constitutions that cannot stand a great amount of vigorous bathing will find an excellent use for the flesh brush in taking what might be called a dry bath. There are seasons when, from having a cold or some other ailment, one becomes particularly sensitive; and at such times a brisk brushing with a good flesh brush will do much towards keeping the skin clean and smooth and the flesh firm, and may with advantage take the place, say every other morning, of the regular daily bath. But the dry bath is only for unusual occasions, the proper use of the flesh brush being as an adjunct to the bath, not as a substitute for it.

**ONE** box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln

**WHY GOOD SWIMMERS DROWN.**—There is nothing in a cramp in a leg to prevent an ordinary swimmer supporting himself in the water by his hands or on his back, or to cause him to throw up his hands and sink once for all like a stone. The cause is attributed to perforation of the ear drum, through which the access of water pressure occasions vertigo and unconsciousness, and a practical caution results, to persons having such perforation, to protect their ears with a stopper of cotton when bathing.

**HAIR OF THE HUMAN.**—The study of the hair upon human species offers an extensive field for inquiry, and one which presents many unsolved problems of the first order of importance. Why man, as a species, should present the kind and the amount of hair which he does is variously explained, and the differences between the varieties of the human race are so great in this respect that one of the most popular subdivisions of species is founded upon it. That the human family have the longest hair of any species of animal is a well-known fact, but why they lost it over most of the body is a subject for much curious conjecture and speculation.

**CLEANLINESS THE FIRST LAW OF HEALTH.**—The following words of the late Dr. Richardson should be ever kept in mind: "Cleanliness covers the whole field of sanitary labour. Cleanliness, that is purity of air; cleanliness, that is purity of water; cleanliness in and around the house; cleanliness of persons; cleanliness of dress; cleanliness of food and feeding; cleanliness in work; cleanliness in habits of the individual man and woman; cleanliness of life and conversation; purity of life, temperance all these are in man's power."

**WE** learn from the *Vegetarian* that Japanese children are suckled by their mothers, so that cow's milk is not needed, and the cow is only used as a beast of burden in Japan. It is interesting to see what is the result of this natural habit, and, as we might expect, it seems generally agreed that it is beneficial. The child benefits in an almost entire absence of the terrible disease of rickets, which is such a scourge in our "advanced" civilisation. Further, too, the ghastly disease of tubercular meningitis and mesenteric wasting which kill off our English children by the hundreds and thousands are practically unknown in this land.

**THE SPONGE BATH.**—While the great majority of women have neither the facilities nor the time to take a full bath every day, nearly all can take a sponge bath, which is all that is necessary for cleanliness. A basin, a sponge, and a cork mat comprise the essentials, and five minutes' application a day will keep the pores of the skin open and the body in a healthy condition. Some people require more bathing than others. Brunettes, as a class, and fat people in particular, are apt to need more baths and lotions to dispel the secretions and perspiration that defile the skin. In order to live up to the ideal, a woman should be exquisitely and habitually clean, and rather overstep than fall short of the so-called hygienic standard. It is advisable to be suspicious of neatness, if necessary, in order to perfect it.

**EXTERNAL USES OF ALCOHOL.**—The use of alcohol as an application and a dressing for excoriated surfaces, ulcers, old sores, and the like, is not what it should be. For all bruises and contusions it is most excellent, preventing any great discolouration of the affected part, and relieving the pain to a greater extent than almost any pain-obtunder. It is almost a sure preventive of "black eye," when that organ has been struck; four or five thicknesses of linen, moistened with alcohol and bound on the part, being all that is necessary. Numerous cases are on record where its use daily as a wash had cured chronic ulcers of the leg, inducing healthy granulations, this being the only medication employed. As an application to ulcers of the rectum, we know of several instances where it has been advantageously employed, the parts being well washed and cleansed with warm soft water, and then a pad of raw cotton soaked

with alcohol inserted—the burning sensation lasting only a short time, and not being very severe. As an injection in cases of vaginitis and leucorrhœa it exercises a very marked beneficial effect. In these cases it should be used in dilute form—say 20 to 50 per cent. in warm soft water. But for ulceration of any part of the vaginal tract the sores should be swabbed once or twice daily with a pledget of cotton saturated with full-strength alcohol. Incipient boils may be aborted by covering the spot with a pledget of raw cotton kept wet with alcohol. Pruritus is always relieved, and frequently entirely cured, by the application of alcohol to the parts.

## "LOVE SEEKETH NOT ITS OWN."

**ONE** sunny day, when life with me was gladness,  
 And I was wand'ring at my own sweet will,  
 Not caring whither, for the world was bright  
 Around me, and above me the blue sky  
 Was flecked with fleecy films whose shadows lay  
 In cooling softness on the lovely flowers,  
 I heard from overhead a plaintive cry  
 As of a wounded bird; and lo! it fell  
 In flutt'ring beauty at my very feet.  
 I found it was no native of these isles,  
 But one which storms had driven from its home  
 Across the troubled ocean. To my heart  
 Its loveliness and grief at once appealed.  
 I gently raised it, but I saw no wound—  
 Its cruel pain was hidden in its breast;  
 It opened its fond eyes, looked into mine,  
 And seeing only love there, closed them  
 Contented, and lay quiet in my hand.

I took it to my home; and soon it learned  
 To love me as I, too, had learned to love  
 It for its beauty and its wondrous voice.  
 Sometimes its song, rich with ecstatic joy,  
 Rose to the highest pitch of eloquence,  
 And thrilled my inmost soul with great resolves.  
 And sometimes it was sad, and made me weep  
 Hot sympathetic tears of love and grief,  
 Because I knew not how to comfort it.  
 Was it that it was pining to be free?  
 I drove away the thought. It could not be!  
 Had I not given it a sumptuous cage,  
 And made its daily wants my constant care,  
 And talked to it, and fondled it within  
 That cage? Ah! yes, "within that cage." Alas!  
 It pined for freedom, and that meant to me  
 The loss of that which I so fondly loved.  
 "So fondly loved"? Say, "loved so selfishly!"  
 For, true love "seeketh not its own." It joys  
 Ever to give its all, yea, life itself  
 To bless the object of its adoration.

So feel I now; but then I knew it not,  
 Or would not know. I closed my eyes to that  
 Which others saw, and kept my lovely bird  
 A captive still. It loved me, yes, oh, yes;  
 It loved me, and because of its great love  
 I could not let it go. So thought I then.  
 But when true love, begot of love, prevailed,  
 I knew that mine had selfish been, and gave  
 My pet its liberty, although my heart  
 Was well-nigh breaking, as I took that cage  
 And in the fragrant garden opened it.  
 My beauty, at the swinging door, then stood  
 And, ere it flew away, poured forth its soul  
 In song,—a farewell song, for I believed  
 That I should never see my pet again!  
 But that one act of freedom was the link  
 Which bound its little heart to mine the more.  
 It left the gilded cage, but not my home;  
 And when it saw me break its prison bars  
 And trample them beneath my feet, it flew  
 And nestled in my breast. I choked with tears,  
 And swore that never more would I confine,  
 By bars of brass or gold, one living thing,  
 But ever by the gentle bonds of love,  
 And love alone, would link each life to mine.

—Alpha Lyra.

**WHAT** a cage is to the wild beast, law is to the selfish man. Restraint is for the savage, the rapacious, the violent; not for the just, the gentle, the benevolent. All necessity for external force implies a morbid state. Dungeons for the felon, a straight-jacket for the maniac, crutches for the lame, stays for the weak-backed; for the infirm of purpose, a master; for the foolish, a guide; but for the sound mind in a sound body, none of these.—Herbert Spencer.

# THE HUMAN BRAIN AND ITS FUNCTIONS.

By AN M.D.

(See Frontispiece.)

## PART I.

THIS subject naturally follows on the series of letters that have appeared in the FAMILY DOCTOR on "Phrenology," a subject which awakened a large amount of interest. Now the question arises, if what Phrenologists state regarding the brain is incorrect, what then are its functions, and how have they been ascertained. This will be our duty to set forth as clearly as this very intricate subject will admit.

The brain is now universally admitted to be the seat of the intellect, but this was not admitted in olden times. Aristotle declared the heart was the seat of the reason, for he said it is the only organ that alters under emotion, which alteration was visible in increased beating. Plato declared it to be the seat of reason. Hippocrates, the great physician, regarded the brain as a great mystery, but laid down extensive rules for the treatment of a number of ailments which he stated had their origin in the brain.

But we cannot linger over what the earliest thinkers thought about the brain, nor trace thought through the black Middle Ages and during the early days of the Reformation. Vesalius, Willis, Malpighi, Haller, names which stimulate us to industry, and the gradual unfolding of the gross anatomy of the brain.

Electricity was the means of putting in the hands of experimenters the first method of ascertaining reliable results, as will be hereafter shown. But to understand the functions of the brain we must be clear on the subject of its shape, form, and component parts. The brain, then, is situated in the skull, and if the bone were removed you would find beneath first a white dense shiny membrane, the dura mater, which protects the brain, and next a delicate membrane which carries the bloodvessels which supply the brain.

The brain, if lifted out of the skull in its entirety and then hardened by immersion for some days in spirit, to allow of its being handled more freely than in its soft, pulpy condition, would be found to be pleated in and out all over its surface, divided from back to front into two halves, and to have a sort of root or peduncle, which was attached and continuous with the spinal cord which runs down the back. And on turning it over and looking at the root (the medulla oblongata, M.O.) there would be seen the cerebellum, C., or little brain, divided also into two halves, situated behind and on either side of the medulla oblongata. The medulla is a pyramid-shaped body of great importance. Above it is a transverse band of fibres about an inch wide, called the Pons Varolii, after the old time physician who first described it. The fibres of the medulla run through the Pons on into the hemispheres of the great brain, and if the halves of the great brain, or cerebrum, are separated, a great connecting band between the two sides will be seen, and several other projections with which we do not purpose to deal, as the matter is too complicated for the subject of a popular paper like this, which aims at giving a bird's-eye view of the main well-ascertained facts connected with the functions of the brain.

The great brain is, as we said before, divided into two halves down the centre, and if you look at the drawing you will see the principal convolutions and fissures indicated, named, and numbered for reference.

Now, if the cerebrum is cut into it will be seen to be composed of, first a layer, about a quarter of an inch thick, of grey matter and then of white; now research has shown that the grey matter is the fountain of all spontaneous thought and action, and the white matter is simply made up of conducting fibres. But whilst there is this simple division into white and grey matter in the halves of the cerebrum,

there are isolated spots of grey matter all over the medulla and pons, and these isolated spots play a great part. For instance, there is a spot in the medulla called the "vital" spot, simply because life ceases at once if it is injured or destroyed. This spot performs the automatic work of transmitting the necessary impulses which keep the respiration going without our being aware of it. If we had to voluntarily inspire and expire, and keep our heart and lungs going, we might possibly forget with dire consequences to the body, so we are formed with an automatic self-containing machinery in the medulla to do the work, but this centre is under the superior control of the grey matter in the cerebral cortex, and so, if we desire it, we can slow or hasten respiration at will, and if our thoughts wander elsewhere, the lower centre in the medulla takes up the work without fail. In Part II. we will deal at much more length with all the known functions of the cerebrum and cerebellum.

## GYMNASTICS IN SWEDEN.

By I. C. BARROWS.

GOING from Saxony to Sweden, one is at once struck with the height, the carriage, and the fine complexion of these people. The Saxons are short of stature. During the time when the university lectures are going on in a city like Leipzig, for instance, this is not noticeable; but when vacation comes, and the three or four thousand men from all parts of Germany scatter to their homes, one finds himself among a race of little men. In Sweden, on the contrary, the men as a rule, seem, by contrast, almost gigantic. The King sets the example, being one of the tallest men in the kingdom—straight, dignified, and handsome. The Crown Prince dwarfs any man beside him. At a recent drill of army officers at the Central Gymnastic Institute, the director, Dr. Törngren, a man considerably over six feet, was the tallest person in the drill hall until the Crown Prince came in and stood beside him. In an instant Dr. Törngren shrunk to a man of medium height, while his future sovereign towered several inches above him.

The women, also, have the same splendid physique, as though Nature had had a fair chance to let them grow as tall as they would. One forgets the gnawings of envy in pure delight and admiration.

Of course, there are plenty of homely, short, and stubby people, such as one finds everywhere; but they attract no attention. In looking at the tall and stately men and women of Sweden, one cannot but ask how much the universal practice of gymnastics has to do with making them such noble specimens of humanity. A few years ago some careful statistics showed that girls who had practised gymnastics were actually taller than girls in the same school who had not. Even those who had attained their height, as was supposed, before beginning regular exercise, seemed, and actually measured a trifle taller from the better way in which they learned to stand and walk. It would not be strange, therefore, if the constant use of the very best system of gymnastics from the age of seven up to manhood and womanhood should, in the course of years, develop a race of tall, broad-chested, erect, and handsome men and women. It may be unreasonable to suppose that ugly features can be changed by physical education; but the plainest face may be made beautiful by a fine complexion, and nothing tends more to create this than simple diet and plenty of wholesome exercise. And these the Swedes have.

Gymnastic drill begins in the primary classes, and is considered an essential part of the education throughout the entire course of study. Teachers are trained in the Central Institute. This institute was founded under the direction of Ling, the father of Swedish Gymnastics, though it is a royal institution and under governmental management.

All the young officers of the army, as they come along in military succession, are compelled to take a regular normal course in this institute. There are lectures and instruction in physiology and anatomy, drill in free-hand exercises, with apparatus, fencing, bayonet exercises, &c. In some of these exercises the

men wear padded leather jackets and helmets as heavy and large as those of the Middle Ages. The weapon is a broad, double-edged sword, which comes down with such a thwack on the helmets that one almost expects to see helmet and head both split asunder. The apparatus is so arranged that a chance is given to practice scaling walls and walking on narrow ways, and the power of balancing that the men acquire is something remarkable. Vaulting of all kinds gives cavalry practice, and the general result is that these army officers find themselves far better fitted for their military duties than ordinary barrack and parade-ground drill could give them. They have plenty of normal work, for the public school children of Stockholm go to the institute for their gymnastics; and these officers, supervised by instructors, are their teachers.

A class of twenty-five young women is admitted every other year. When one class has finished the prescribed two years' course, another class begins. It is strange that it cannot be so arranged that a class can enter every year.

Sailors, as well as soldiers, must undergo this daily drill until they have completed the prescribed course. They have just had their annual examination and public display of their powers. An enthusiastic young gymnast thus describes the successful occasion:—

"As boys, of course, they were spry; as soldiers, they were precise; as gymnasts, they were finely developed; and as sailors, they were nimble and light. You can imagine the combination of all four. How they did frisk and scramble and drop off from high places, never making a sound! They were just like cats. Their feet were so light that they seemed to find it as easy to keep them stretched in the air above their heads as to stand on them. I think what appealed to me most was when the whole class, in two long rows, Indian file, all turned cart-wheels—or Catharine wheels—at once, rolling clear across the hall, keeping the lines straight all the time, and all doing it in the same rhythm—oh, so nice!"

Not only is great attention paid to pedagogical gymnastics in Sweden, but therapeutic, or medical, gymnastics play an important rôle. Every nurse learns to give massage, every physician learns when to prescribe it; and manual treatment is given at the institute for all manner of diseases. The normal classes also are taught the value and the practical application of this method of treatment. And, since there is much more disease than there are hands to treat it, steam is called into aid; and in a large medico-mechanical gymnastic establishment one may be rubbed, pounded, shaken, stretched, pressed, vibrated, trotted on a saddle, suspended, measured, "chopped," flexed, rotated, and jolted as on a velocipede by a Zander machine of one kind or another. These machines are by no means intended to supersede manual treatment but to supplement it. They are marvellously simple, and at the same time effective. They are like tireless human hands, and are guided by what seems almost like intelligence in the machine itself. The trades association of Germany are rapidly adopting this method, and the percentage of cures of members of these associations who have been treated is remarkable. Men who are obliged to leave hospitals before they are ready for work rapidly acquire strength under this treatment. It appeals to one's common sense as infinitely preferable to tonics for building up the human system.

The combination of pedagogical and medical gymnastic treatment may account for the fact that it is almost impossible to find a chemist's shop in Stockholm. After diligent search two were eventually discovered, but so modest in appearance that the casual passer-by would never suspect what they were if he were unaware of the fact that the devices of the serpent and the owl in the glass window-panes hint at the medicines that may be found within.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 11d. and 2s. 9d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 15 or 24 stamps by the Maker, E. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

## A FEW WORDS ABOUT WATER.

BY A YOUNG PHYSICIAN.

AS water enters so largely into the composition of our bodies, constituting, as it does, three-fourths of the entire body weight, and as it forms a most important agent in the chemical and physical changes which take place in our vital processes, a few words upon this important fluid may not lack appreciation in these columns.

As a matter of fact water is one of the most important, if not the most important, dietetic agent we possess; for without it the tissues of the human body could not exist, and when the supply falls below the normal, the dire results of such abstinence is familiar to all. Just as the plant withers and dies from want of a due supply of water, so with the human subject.

Leaving out of consideration here the analytical composition of water, and the intricate physico-chemical processes to which it is subjected in the body in order for it to fulfil its proper function, we will pass on to more general details concerning it. It is absolutely essential that water for dietetic purposes should be pure—that is, fresh, limpid, without odour or colour, and having an agreeable taste. It ought to contain a certain percentage of gas and mineral matters in solution, and be free from vegetable and animal substances (organic matter). It is the carbonic acid gas and mineral substances dissolved in water which give it its agreeable taste.

In order to maintain the quantity of water at a uniform amount, a balance is struck between the quantity taken in and the quantity lost by exhalation, evaporation, and excretion from the lungs, skin, and kidneys.

The uses of water in the animal economy are to dissolve the food, and thus assist in its conveyance to different parts of the system; to dissolve and remove effete products from the blood and tissues; to assist in equalising the body temperature by evaporation, and to assist in building up the tissues of which the body is composed.

Having thus glanced in a cursory manner at the part played by water in the economy, we may go on to state as to how our knowledge may be applied to the benefit of the community.

Notwithstanding the lessons to be gleaned from a study of the good effects produced in a large portion of the community by an annual sojourn at one or more of our now numerous hydropathic establishments, mineral springs, &c., we fail to believe that a sufficient knowledge concerning this important dietetic and hygienic factor—water—is met with amongst the majority of people, hence our endeavour to point out a few points connected with the subject.

Without entering into a consideration of the conditions requiring residence at mineral springs or special baths—we leave that to the physician in the treatment of individual cases—we will merely point out a few matters which may be utilised broadly.

In the first place, water is applied externally as a cleansing agent, and its importance in this direction is of the greatest magnitude. Then nothing can be more beneficial than the daily cold shower or plunge bath (before breakfast), followed by the brisk application of a rough towel until the skin glows with reactionary heat. In delicate persons, and those who cannot stand the cold shower or plunge, cold or tepid *sponging*, followed by active rubbing, should be adopted. The bath thus used acts a general tonic of the highest order, bracing up the system, stimulating and causing the skin to act efficiently in its most important aspect as an eliminator of waste material. In order to attain these ends the bath should not be prolonged so as to cause a chill, but should be a rapid procedure, and the subsequent friction is a most important factor in the process, causing reaction in the skin. Thus used it acts by maintaining a healthy condition of the skin in keeping its excretory structures free, and is a first-rate preventative against catching cold.

The hot bath, ranging from a temperature of 90 degs. to 112 degs. F., besides being used as a cleansing agent, acts, in the first instance, as a general stimulant; but is apt, if prolonged, to be followed by depression of the heart's action,

and consequent bodily enfeeblement. It is an excellent measure to adopt in the early stages of all feverish affections, especially in children, to open the pores of the skin, and produce copious perspiration.

Having treated in a general way of the uses of water externally applied, we may now turn our attention to the uses of that fluid when taken into the body.

A healthy adult man requires daily 70 to 100 ounces of water, one-third of which is contained in articles of diet, the other two-thirds being supplied in the form of additional fluids. As we have said, water dissolves the food and helps in its conveyance to all parts of the system, and removes effete and waste products. When water is introduced into the mouth it stimulates to some extent the secretion or pouring out of saliva, which latter fluid has to do with the conversion of starchy matter contained in the food into sugar. It also dissolves salts and saccharine matters. Thus we see its importance at the very start of the digestive process, and we must admit that a certain amount of fluid is essential to the proper digestion and assimilation of food.

Physiologists tell us—and there is every reason to believe that they are correct—that when food enters the stomach it is turned over and over, and so thoroughly mixed with the gastric juice, or digestive fluid of the stomach. What, then, we ask, could aid digestion more than a due amount of water introduced at intervals during the progress of a meal? By this means the solvent power of the water is carried still further; and, as a natural sequence, digestion and assimilation are assisted. It must be stated in passing, however, that the introduction of a large quantity of cold water into the stomach may be productive of the arrest of the process we wish to aid, for, in order that the digestive juice of the stomach be poured out, the blood-vessels of the organ become engorged with blood at the commencement of the digestive act, this condition remaining during the process; and if a large quantity of cold water be introduced, a chill may result, followed by contraction of the vessels, and thus the process is hindered or arrested. Hence the evil of partaking of large draughts of water immediately before or during the progress of the meal, a practice which is common with some individuals. For water to be of use in the important process of digestion it should be taken in small quantities at intervals during the progress of a meal.

Another use of water in the economy, as before stated, is the bathing of the tissues and the removal of waste products from the system. This is brought about by means of the circulation, through whose agency the fluid is carried to all parts of the body, dissolving in its course soluble matters and carrying them away through the channels by which water leaves the system—namely, the skin, kidneys, &c.; and by the washing away of this effete or waste matter, the way is paved for the growth of new material. If these waste products were allowed to accumulate, the vital processes would be effectually clogged, the system poisoned, and a whole train of serious evils result; but by their removal the way is opened for reconstruction of tissues, and thus the general tone of the system is improved. It is a recognised fact that too little water is taken by most persons, especially by those in the higher walks of life; and in these we see the natural result—namely, illness attendant upon deficient elimination of refuse material.

A draught of cold water every morning is an excellent hygienic measure, stimulating the action of the bowels, giving tone to the stomach, and increasing the appetite. Moreover, water taken in this way when the stomach is empty is more rapidly absorbed, gains access to the tissues, and thus is better enabled to wash away the waste products.

A few words may now be said concerning the drinking of hot water—a measure advocated by some eminent members of the medical profession in America, but not appreciated according to its merits on this side of the Atlantic. All are acquainted with the beneficial and prompt action of warm water when it is taken to produce sickness, and it is the most handy, and often the most useful, emetic we possess. Taken at a higher temperature than to produce sickness—say, at the temperature at which we

drink our tea—it is found not only not to produce sickness, but oftentimes to allay it. It is strongly advocated in America in certain forms of dyspepsia, and we have frequently seen its good effects. In individuals whose occupation is sedentary, and in whom the appetite is poor, who are plagued for hours after their meals with pains in the stomach and bowels, feelings of drowsiness and oppression, half or a tumblerful of water as hot as it can be comfortably borne, sipped slowly after the meal, is followed by disappearance of the symptoms, which renders eating a misery, and produces feelings of comfort to which the dyspeptic martyr has long been unaccustomed. In those who, as a general rule, are free from dyspeptic trouble, but who at times experience vague feelings of discomfort after meals, the tumbler of hot water is decidedly beneficial. So called bilious subjects who are martyrs to sick headache, with sallow complexion, poor appetite, irregularity of the bowels, and show signs of depression generally, may often be permanently relieved by careful diet, fresh air, and the use of a glass of hot water taken two or three times a day. In certain individuals a glass of cold water in the morning would be intolerable, but if the water be taken hot the same good results accrue. In rheumatic and gouty subjects in whom the non-elimination of waste products is the source of trouble, the hot water habit lessens the tendency to bouts of illness, and these may often enable such persons to live in comparative ease and comfort.

Some will exclaim against the practice on the score of its tendency to produce sickness, but, as we stated before, tepid water is a pretty effectual emetic, whereas if the water be taken as hot as it can be borne with comfort, no such result will take place. Moreover, if taken in this way the water is not nearly so disagreeable to the palate as would be supposed, and those who are accustomed to the habit state that it is positively pleasant, giving a sense of sweetness and cleanliness to the mouth.

Much more might be said upon the subject, but we think enough has been set forth to impress upon the reader the importance of a plentiful supply of water, and the valuable means he has to hand in the prevention of disease, and in the preservation of hygienic principles which are of great importance in everyday life.

## ONE CAUSE OF PNEUMONIA.

THE increase of pneumonia cases among middle-aged men is thus speculated upon by Dr. I. F. A. Adams:—“Without attempting to dogmatise in what may be called an unexplored field, it is pertinent to ask whether the great increase of steam-heated office buildings, in which the great majority of rooms have no adequate means for renewal of the air to be warmed, may not in a large measure account for it. Many of these buildings are admirably constructed to keep out air, whether cold or hot, and this very perfection contributes to their insalubrity. In these hermetically sealed office rooms that abound in our business buildings, the steam heats the atmosphere to a delightfully comfortable degree; the occupant breathes and re-breathes the air in the zero days, when he cannot endure an open window; and the effect is to silently undermine his powers of resistance, so that when he goes forth, exchanging this balmy tropic air for the keen breeze of a frozen harbour, it may be—through some subtle change in his system which has robbed his lungs of their power of resistance—their ability to endure the onset is gone, and in a few days his death of ‘pneumonia’ is recorded.”

HARDY MINERS TOIL LONG AND HARD in the bowels of the earth to bring forth precious gems and metals for the use and pleasure of their fellows. In many parts of the world the pick and shovel have struck the first blow of civilisation. Holloway's Pills and Ointment have been potent factors in the quick march of progress, for they have given the armour of good health and strength to travellers both by sea and land. They protect the system from attacks of disease even in climates where its influence is fatally felt. During the present hot weather, when stomach and liver complaints, diarrhoea, dysentery, &c., are liable to attack anyone, these remedies will be found simply invaluable.

## THE ORIGIN OF THE INCAS.

IN the library of the British Museum, the largest in the world and a veritable treasure house of rare and precious literature, says the *Globe*, the student may examine a Spanish manuscript (No. 25,327) written in 1631 by a member of the Society of Jesus, a missionary in Peru, Father Joan Anello-Olivio, a native of Naples. This work of his, which has never been published, is full of information that cannot fail to interest all persons who have read anything about Peru. Dr. Le Plongeon made an exact copy of the Spanish manuscript, and a condensed translation appears in the *New York Tribune*. According to this, the story of the Incas runs as follows:—After the great deluge, the first who came to people these countries (South America) landed at Caracus, afterward spreading over the territory even to Peru. Some of those colonists found their way to Sumpa (Point Santa Elena), two degrees south of the equator. There they founded a great city by order of their chief, Tumbe, a good, intelligent, and just man. After a time he sent out an expedition with orders to seek other lands and return in one year, but those people never came back, though after several years had elapsed some were heard of in Chili, Paraguay, Brazil, and remote parts of the continent.

## THE LOST EXPEDITION.

Tumbe was profoundly grieved at not knowing what fate had overtaken those sent out by him; and because he was too advanced in years as well as too infirm to go in search of them, he mourned so much that he brought on an illness which resulted in his death. He left strict orders that someone should go to find out about the expedition, and that if new lands were found, settlements should be formed in them. Tumbe left two sons. The elder was named Quitumba, the other Otoya. It was not long before these two men disagreed concerning Government affairs, and the result was that each lived in fear of the other. Quitumba, the elder was also the wiser, and he resolved to avoid trouble by leaving his brother in undisputed authority while he went away to search for the lost expedition in compliance with his father's dying commands. He guided his followers to fertile plains in proximity to the sea, and in latitude three degrees south founded a town, which he named after his father, Tumbe, (now called Tumbez). Quitumba had a wife named Llira, famous for her beauty, and he had left her at home, she having consented to his going only on condition that he would return within a fixed period; but this he did not do. She bore a beautiful son and called him Guayanay, which means swallow. From him descended the Incas. The father of this child having founded a new city in the plains, did not forget his own father's last wish; he sent out parties of men to search for traces of the lost expedition. These journeyed many days along the sea coast, and reached the city of Rimac (now Lima), whence they returned to Quitumba, telling him that they had found good and extensive countries for the foundation of new cities. But they had not obtained any knowledge regarding the last expedition.

## INVASION BY GIANTS.

Meanwhile, Otoya, the second son of Tumbe, had remained at Sumpe, free from all interference on the part of his brother. He consequently gave way to his evil propensities, indulging in all manner of excesses, till finally his vassals resolved secretly to put him to death. Unhappily for them, Otoya, discovered the conspiracy and inflicted a most cruel death on those who had plotted against him. After that affair he continued in the gratification of all his vices. But while he was following this unbridled career the country was suddenly invaded by giants of formidable size and forbidding aspect. They were also exceedingly cruel, and soon made themselves masters of the place. The vicious Otoya was taken captive, and all his subjects were treated with such tyranny by the newcomers, that they lived in terror. But Pachacamac delivered them from that dreadful oppression by destroying the wicked giants, no less vicious than Otoya, who died in his prison. The God caused

a rain of fire to fall on the giants and consume their bodies. Tradition says that those giants had come by sea and were four times as large as ordinary men. We may safely regard this as a poetical exaggeration. It is, however, true that exceedingly large human bones are even now found along the coast in many places showing that at some time or other giants really did live there. According to Zarate the tradition is to the effect that Pachacamac sent a beautiful youth, who, descending from the sky in the midst of a resplendent cloud, hurled thunder-bolts upon the giants until they were reduced to cinders.

## A FORSAKEN WIFE'S REVENGE.

Meanwhile Quitumba, the elder brother, living in the city of Tumbe, had heard of the arrival of the giants and of their doings in his native place. Fearing lest they should come to treat him and his people in the same manner, he resolved upon a general move. In order to make escape sure he caused a number of canoes to be made, and with all his vassals sailed out to sea. After two days they reached an island, fertile and fruitful. They called it Puna (in the Gulf of Guayaquil), and establishing themselves there, resolved not to return to the mainland while the giants held possession of it. Constancy does not seem to have been one of the virtues of the wise Quitumba, for he had in no way kept his promise to his wife Llira. At the end of ten years she learned that her husband was alive and had settled on the island. Losing all hope of seeing him again, and enraged at his desertion of her, her love for him turned to profound hatred. Unable to avenge herself personally, she went secretly, taking her little boy Guayanay to the summit of the sacred mountain of Tancar, where on her knees, weeping, she implored Pachacamac to avenge her, and chastise her faithless spouse. Tradition has it that surprising phenomena immediately occurred as if in token of Pachacamac's having heard her. The recital of these occurrences still forms part of the native folk lore. It is related that suddenly the skies were overcast, darkness prevailed and a terrible tempest of rain, hail, and lightning ensued. The elements seemed at war with each other, and Nature to be rending herself. It is said that from that day the winds, every year at a fixed period, change their direction and blow continually for a certain time from the south-east along the coast. From that time also rain ceased to fall in those parts.

## A ROMANTIC ELOPEMENT.

In view of the omen granted her, Llira, full of gratitude, resolved to offer her son as a sacrifice. She built a pile of wood and laid her child upon it, but just as she was about to apply the torch a condor descended from the heights, and, seizing the boy in its claws, flew to a floating island called Guayan. There the youth remained hidden for ten years, maintaining himself on the roots and fruits. After the dreadful storm that had been raised by Llira's prayers the countries on the coast suffered from drought, becoming arid and desert as they now are. When Guayanay had reached his twenty-second year, a terrible tempest drove his floating island to the mainland, and left it stranded at a place inhabited by a fierce and barbarous tribe. Impelled by curiosity, some of those people boarded the island, discovered the young man, and led him prisoner to their Cacique. This chief had him imprisoned, intending to sacrifice him at an approaching festival. Guayanay was a good-looking fellow, with a clear complexion and curly hair. A great number of persons came to look at him and hear his story; but the Cacique's daughter Ciguar loved him at first sight, and made up her mind to save him, cost what it might. She found an opportunity to tell him that she would risk her life to rescue him if he would let her accompany him where fate might direct his steps. To which he replied that he would gladly devote his whole future to her. During the night Ciguar managed to effect the escape of the prisoner and to elope with him. After several days they came to an island which on closer inspection proved to be Guayanay's own floating home that the winds and tides had again carried far from the mainland. There the young couple made their home and lived many years blessed with a large family. Ultimately, Manco, Guayanay's son, left the island with

his people, in obedience to his father's wishes, and settled on the mainland, thus founding the Inca dynasty.

## BEDROOMS.

FOR matters of health and pleasure, it is important that bedrooms should be kept with absolute cleanliness. There is no truer test of good housekeeping than the care taken of sleeping rooms.

In the first place, painted or waxed floors are far preferable to those with covers. If carpeting is insisted upon as a matter of comfort, let it be in the form of a very large rug, which can be removed occasionally and thoroughly beaten. Many housekeepers leave carpets down in bedrooms from one year's end to another, allowing the accumulated dust and possible disease germs to be breathed into the lungs of the unsuspected sleepers.

In no apartment in the house is such simple taste so welcome and appropriate as in the bedroom. Here there should ever be an air of quiet and repose, and a complete absence of all obtrusive colours. An air of subdued harmony should invest the entire apartment; and walls, ceiling, floor-coverings, woodwork, and hangings should all be selected so as to unite all together and form a peaceful *tout ensemble*.

If carpets are tacked down, they ought to be taken up and cleaned thoroughly at least twice a year.

Large "stuffy" chairs, heavy window draperies or lambrequins, elaborate bric-à-brac and bookshelves, large picture frames, and all other things likely to become repositories for dust, are objectionable. Sleeping rooms ought to be simply furnished, given all the sunlight possible, and thoroughly aired every day. It seems impossible to think that there are housekeepers who make beds before breakfast, and without placing the sheets and blankets in a position to be thoroughly aired.

The springs and under part of the bed ought to be thoroughly cleaned and dusted at least once a week, and mattresses beaten and turned. Badly soiled ticking on pillows and mattresses is seen frequently, and when found masquerading beneath snow-white pillowslips and sheets is especially revolting. The cleanliness of housekeepers who tolerate dirty bedticking is certainly only "skin deep."

Comfortables and blankets soil easily, and must ever prove a special care to housekeepers. Much of the soiling comes, however, from allowing the covering to come in contact with the floor, which is needless and ought never to happen. A piece of cheese-cloth caught with zephyr along the upper part of a blanket, and covering the fold, will protect it from being soiled on that part which is liable to come in contact with the body of the sleeper. Pillowslips, sheets, towels, splashers, &c., should be of snowy whiteness; and a word about laundrying may not be amiss.

Avoid the use of all washing compounds and soaps for which wonders are claimed. They contain very powerful chemical agents. Buy a good quality of any laundry scap. Place the bars apart, so that the air can circulate between them freely, and as they dry, the alkali and any other chemicals they may contain will be drawn to the surface, and may be removed before the soap is used.

A small piece of salsoda, about the size of a walnut, may be placed in the boiler with the clothes, and will serve to whiten them. The salsoda, however, must be thoroughly dissolved before the clothes are placed in the water containing it. A very small amount of bluing may also be added.

Clothes should be rinsed at least twice after leaving the boiler. If the rinsing water is not perfectly clear, make it so by settling with a small bit of alum.

In ironing use hot flats and press every part carefully. Do not leave fine wrinkles and half-ironed places, as many housekeepers do.

KEATING'S POWDER.—Kills bugs, fleas, moths, beetles, and all insects (perfectly univalued). Harmless to everything but insects. Sold in Tins, 6d. and 1s.  
WORMS IN CHILDREN.—Are easily, surely, and with perfect safety got rid of by using KEATING'S WORM TABLETS. Tin 1s. 14d. Free by post 1s. 6d.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**CHICKEN TEA** may be prepared life beef-tea, substituting chicken for beef. The bones should be used as well as the flesh, the whole finely chopped up. The feet add to the nutritive qualities, and impart a characteristic flavour.

**RAISED PIES.**—To make raised pies to stand whilst baking, you must boil the lard, butter, and beef suet. One-third the proportion of the last two to the lard with the water, pouring the whole boiling into the flour. For small pies you should begin to raise at once, dividing out into the sizes required. If you cannot manage to raise with your fingers, a block may be used, or for a large pie a mould.

**FOR SWISS ROLL.**—Take ten eggs, eighteen ounces fine sugar, twenty ounces flour, two large tablespoons warm water, six drops lemon essence. Whisk as for sponge cakes; add water; when batter is ready, previous to baking, butter a large sheet of strong white paper, turning up sides and pinning the corners about half-an-inch high. Spread the batter thinly, and bake in hot oven; when baked turn over on to another sheet, sprinkle with pink or white sugar, spread jam freely over while hot, and roll closely.

**SEMOLINA PUDDING.**—(1) Put two table-spoonsful of semolina into a dish; moisten well with cold milk; add one pint of boiling milk, sweeten to taste; grate nutmeg, and put a few small pieces of butter on the top; and bake in a moderate oven three-quarters of an hour. One or two eggs may be added if required richer. They should be lightly beaten, and a little of the boiling milk added, stirring all the time, to prevent their curdling. Then put them into the pudding.—(2) Take two ounces of semolina, a pint of milk, two ounces of sugar, two eggs, half an ounce of butter, and a little nutmeg. Boil the semolina gently in the milk until it thickens; then add the butter, sugar, and nutmeg; when cool, stir in the eggs; pour it into a buttered pie-dish, and bake half an hour.

**COCOA-NUT BISCUITS.**—Take one grated cocconut, one cup of powdered loaf sugar, the whites of three eggs whipped up stiff, one table-spoonful of corn-flour, moistened with the milk from the cocconut, and sufficient rose-water to flavour. Whip the sugar into the stiffened whites; then the corn-flour, the cocconut, and rose-water, last. Beat up well together, and pour by spoonful on buttered paper, and bake half an hour.

**GAME PIE IN A TERRINE.**—Skin and clean a fine hare. Cut the flesh clean off the bone, have the same quantity of veal, free from skin and gristle, and an equal quantity of fresh pork. Mince it all fine, seasoning it with salt and pepper; also chopped onion if liked. Place at the bottom of a terrine a little salt and pepper, a laurel leaf cut in three or four pieces, and a small sprig of thyme, also cut small. Then put in the minced meat, press it well, cover it with a very thin rasher of bacon; sprinkle it with salt, pepper, thyme, and laurel leaf as before. Pour over it half a tumbler of water and a wineglass of brandy. Cover it as close as possible, and bake in a moderate oven two hours and a half. To make it more savoury, the bones of the hare and the cuttings of the meat may be stewed for two or three hours with an onion, a carrot, some sweet herbs, and when the pie is baked this gravy can be poured over it, simmered for five minutes, and left to cool. Another way is to cut the meat off the hare and veal into pieces the size of a finger, and, instead of the pork, take a pound and a half of sausage meat, well-seasoned, with which mix the heart and liver of the hare cut small. Having lined the terrine as before, put a layer of mince a finger thick, then a layer of the pieces of meat well pressed down, then the mixture of mince again, and so on till the terrine is filled, and a rasher of bacon on the top. Flavour it, and add the water and brandy

as before. When it comes out of the oven put a weight on it till the next day, when it must be slightly warmed, the cover taken off, and a coating of clarified lard, or some sort of good fat, poured all over the surface to keep out any air, then put on the cover of the terrine, and close it hermetically by pasting paper all round, and a cork in the hole in the centre. Treated thus, and kept in a cool place, it will remain good for a long time. Any sort of game can be used.

## HINTS FOR THE HOUSEHOLD.

**AMMONIA** in dish water removes grease and soil.

Use salt and vinegar to clean brass utensils and ornaments.

**TURPENTINE** sprinkled in the haunts of cock-roaches will scatter them.

**BURNING** paraffin may be almost instantly quenched by throwing flour upon it.

**FOOD** cooked in earthenware preserves the flavour better than when cooked in iron vessels.

**PIES, &c.,** moistened with milk just before they are put into the oven bake a nice brown.

**SOAP-BARK**, which may be obtained at most chemists, is excellent for cleansing white woollen goods.

**WHISKY** is recommended to remove all kinds of fruit stains.

**IRON-RUST** may be removed by covering the spots with paraffin oil. Let them remain covered some time.

**LIME** and water mixed to the consistency of cream is the best mixture for cleaning and brightening zinc.

**WHITE** sheepskin rugs may be cleansed by scrubbing them with castile soap and water, and drying thoroughly in the sun.

**WHEN** anything is spilled or boils over on the stove, the bad odour may be counteracted by sprinkling a little salt upon it.

**ICE** may be kept without a refrigerator if closely wrapped in a thick, strong cotton cloth, and put in the cellar in a large tub, supported in such a way that the water from it may not rise around it.

An important industry has arisen in France, the selling of milk frozen solid in cans. It has been discovered that milk can be kept perfectly fresh in a frozen condition for more than a month. It is frozen by means of an ordinary ice-making machine, and despatched by rail, or steam, to its destination. The customer who purchases the frozen milk has simply to thaw it when it is required for use.

**A GOOD LINIMENT.**—A cheap stimulating liniment, which will be almost odourless and yet effective for outside application, can be made as follows:—In one quart of turpentine mix one quart of coal oil. Pack half an ounce of alkanet root and two ounces of pulverised capsicum in a large ordinary funnel. Over this mixture pour the turpentine and oil, allowing it all to percolate through the capsicum and alkanet root. In this way it will extract the substance of the capsicum and take on a beautiful red from the alkanet. After this has been done, add one ounce of the oil of peppermint and four ounces of gum camphor. To make it more fragrant add a little oil of pepper grass. This liniment thus completed is a strong, efficacious one to rub on the skin, and so clean and fragrant that even the most fastidious would not hesitate to use it.

**A VALUABLE EMULSION.**—The paraffin emulsion is a valuable insecticide even when applied to flowers, a use which some no doubt have never thought appropriate. A writer says in his experience with tender plants, such as pelargoniums, geraniums, and the like, he was very much troubled with a little green worm. He tried sulphur, tobacco smoke, and various other solutions. The emulsion is prepared in a small way by putting one cup of boiling-hot soapsuds into a bottle. Then add two cups of paraffin oil, and shake vigorously for five minutes. A little of this, diluted with from

ten to fifteen times its bulk of warm water, will make a solution of the proper strength for spraying. One of the little perfumery sprays worked with a rubber bulb will answer every purpose.

**DANGERS LURK IN KITCHENS.**—"Don't you know," said a physician, when he saw jelly cooling outside a kitchen window, "that when we medical men want to secure organisms for investigation we expose gelatine to the air or in places where we have confined malignant germs? The gelatine speedily attracts and holds them. Cool the jelly if you must, but cover it with a piece of close-wove muslin, or, better, if you have it, some pieces of glass taken from some broken window-pane." It is to be feared that kitchen processes are sources of illness more often than is imagined. In many city houses the little kitchen annex, or pantry, where the various eatables are kept, is directly against a drain or closet. Yet here stand daily uncovered milk, butter, often custards and puddings, and various other absorbents. The average cook is absolutely ignorant of sanitary cause and effect, and the eternal vigilance of the housewife is the family's chief safeguard.

**AN OLD TRUTH.**—Someone has said that one-half the misery of life at least, if not more, comes to people from not being able to make both ends meet, and yet how unnecessary is the nervous strain and worry of mind which arises from the foolish attempt to keep in the midst of fashionable people—to keep up appearances which are beyond one's income! If it does happen, as it sometimes will, with gratification to both sides, that bright people with small means are thrown in the way of wealthy acquaintances, always let it be with frankness and with open acceptance of the fact. Putting on airs is detrimental to self-respect. Much better to say at once, "We cannot afford it," never apologising for the smallness of the house or the lack of domestics, never pretending to be other than you are. In this way and this only can housewives, who do much of their own work in unpretentious homes, find intercourse with their wealthy neighbours agreeable.

## TO CLEAN HAIR BRUSHES.

**TO** keep hair brushes in good condition they should be washed once a week, not oftener, as very frequent washing spoils them, by making them too soft to be useful. This should be done by dissolving a piece of washing soda the size of a walnut to a quart of water. After combing out all the loose hairs from the brushes, they should be dipped, bristles downwards, up and down in the water until perfectly clean, care being taken to keep the backs and handles as free from the water as possible. Then they should be rinsed, in the same manner, in tepid water, into which a little borax has been dissolved, shake them well, and dry the handles and backs with a soft towel. Put in the sun or near some artificial heat, bristles downwards, to dry, not too quickly. In the absence of washing soda, ammonia could be used for the same purpose, about a teaspoonful to a quart of water. Soap should never be used, neither should the bristles be wiped or rubbed with a towel, as they soon become very soft.

Hair combs should never be washed unless it is absolutely necessary, as water has a tendency to make the teeth split, and it also roughens the tortoise shell or horn of which they are usually made. Small brushes, manufactured expressly for this purpose, may be procured, at a trifling cost, and with this the comb should be thoroughly brushed and afterward wiped with a cloth.

THE title of Doctor was invented in the twelfth century, at the first establishment of the universities. William Gordenia was the first person upon whom the title of Doctor of Medicine was bestowed. He received it from the college at Asti, in 1329.

**TIGHT LACERS.**—Ladies and Gentlemen's Corsets Fitted Personal visit not necessary. Self-measurement form free by post. Satisfaction guaranteed. Best qualities. Lowest prices. Close fits for Professionals. Neatness, comfort, health. FORD AND PARR, 141, Stockwell Road, London, S.W. Estab. 1856.

# THE MOTHER'S PAGE.

## THE USEFUL WOMAN.

WOMAN'S heart is supposed to be the very dwelling-place of mercy, and a useless and selfish woman is a libel upon her sex. We call upon you to be our sisters of charity, to go forth on errands of mercy to the abodes of sickness and poverty without abjuring all pretensions to the character of wifehood and motherhood. Loathe that spurious sentimentality which weeps over the imaginary woes of a novel, but turns away with a callous heart from those real sufferings which abound on every hand. You do most for yourselves when you do most for others. It is not enough that you pity the sorrows of the poor and the suffering; what your heart pities your hands must do; what you pray for you must strive to attain.

If you desire to live, in the true sense of the word, you can least afford to be useless. It is lamentable to see how many women live only as a waste and weight on fast-flying time. O you poor souls living in uselessness, how can I make you see what you are losing? What can I say but,

"Rise up, ye women that are at ease,  
Tremble, ye careless daughters,"

and repeat the old call, "Awake, ye that sleep, and arise from the dead, and Christ shall give you light."

In the woman form of merciful ministry humanity feels the touch as of an angel from heaven. Say not the doors of useful service are closed against you, when there are so many poor to help, so many sick longing for the sound of a woman's voice, and the touch of a woman's hand. If you have an earnest purpose, it will not want for a sphere, it will make its own sphere. Would you realise the divinest of womanhood's ideals and be "as the angels," listen to the moans of suffering around you. Harken to the voice that whispers in your soul; begin with some plain, practical, petty duty immediately at hand, and in faithfulness to the lowly duty your life will gradually be brought under the power of a supreme purpose.

"And so make life, death, and that vast for ever  
One grand, sweet song."

## PUNISHING A CHILD.

WHEN a mother inflicts punishment upon her child, it is generally done upon the impulse of the moment. She is harassed with domestic cares, until patience almost ceases to be a virtue. Just at that unlucky moment the child will commit some indiscretion. Trivial it may be, and is in ninety-nine cases out of a hundred, in its nature, but when we are worried a molehill looms up like a mountain. Without thinking she boxes the child over the ear, strikes him upon the head, or shakes him, until the poor thing does not know which will come loose first, his teeth or his hair. A moment later the mother feels a pang of regret, but the harm has been done, and the child's self-respect has been injured, for that is what corporal punishment does for a child more than anything else. By foolish notions of punishment we kill self-respect in our offspring in childhood, and then, when they grow up, we wonder what has become of it. Mothers frequently, it seems to us, punish their children not so much because of their disobedience, but to give vent to their own overwrought feelings. The first and great lesson which women must learn in this matter of punishment is the value of self-control.

THE tendency to enlarged tonsils is hereditary. When one child of a family, where all the children have enlarged tonsils, contracts diphtheria, the others run much greater risk of contracting the disease than they would with normal throats. This risk can be greatly

**STEEDMAN'S Soothing Powders for Children** cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Walworth, Surrey. Sold everywhere. Please observe the *EE* in Steedman.

reduced by removal of the tonsils. Recurrent attacks of follicular tonsillitis are best treated in the same way. The tonsils should be amputated in the interval between two attacks.

## WOMAN BEFORE THE LAW.

THE laws of England are, in most cases, what might be called "men's laws," so unequal is the justice they deal to men and women respectively.

For instance, a man is eligible for every office in the kingdom, and is under no restrictions as to voting.

On the other hand, there are many offices a woman cannot fill, such as member of parliament, county councillor, &c., although she may be queen. She can vote in certain municipal and school elections, but for nothing higher. She cannot serve on a jury except in one special case.

All English temporal peers sit and vote in the House of Lords.

A woman may be a peeress in her own right, but she has no seat or vote. There is one recorded case of a female baronet.

All professions are open to a man.

A woman may not be a clergyman, soldier, barrister, or solicitor. She may not even drive a cab or 'bus for hire in London. But women have been parish clerks and sextons. A woman was once high sheriff.

The law relating to inheritance of land prefers males to females. In nearly every case an eldest son inherits, to the exclusion of all other children.

When daughters inherit land they share it equally. As regards personal property, a man is his wife's heir, but a widow is her husband's heiress only to a limited extent.

When a man survives a wife possessed of land he will, in certain cases, own it all for his lifetime. In similar cases, when a wife survives her husband, she will have a life interest in only one-third of his lands.

A man's domicile is not altered by his marriage. A woman has to adopt her husband's domicile for her own.

A husband is *prima facie* entitled to the custody of his children. A wife has no such right, nor will the Courts readily grant it.

A man has a right to select the religion of his children.

A man has full rights over his own property.

A woman married before January 1, 1883, has only limited rights over property which was hers before that date.

All these points are decided favourable to the man. But he does not have it all his own way, as the following facts show:—

Any adult man may be made bankrupt or imprisoned under the debtor's act. A married woman can be made bankrupt only if trading separately from her husband. She cannot be imprisoned under the act.

If a man orders goods in his wife's name, he must usually pay for them. A man must generally pay for all necessary articles his wife orders. He is even responsible, to a certain extent, for debts she has incurred before marriage.

A man is responsible if his wife commits libel or slander, or does any wrongful act for which damages could be claimed. He is responsible in this case also, to a certain extent, for such acts committed before marriage. A wife is never responsible for her husband's wrongful acts.

A man may be compelled to allow his wife sustenance money while she is carrying on a suit against him, or is forced to live separately from him.

In some cases married women may testify privately as to whether their signatures to documents were made without fear or favour. Equity will assist a wife, if her husband has made some mistake in executing a power of appointment in her favour.

There seems to be some manifest injustice on both sides, but the wheel of legal reform moves slowly, and probably a dozen Dickenses may write a hundred "Bleak House" arrangements of the powers that be before any changes will be made for the benefit of either party.

## SIMPLICITY AND FRUGALITY.

THE principal effort made by this journal during its years of existence has been to urge the value and protection of simple habits. The same idea, applied especially to the training of children, is thus emphasised by Froebel in his "Education of Man." He says:—

"Always let the food be simply for nourishment, never more nor less. The peculiarities of the food, its taste or delicacy, should never become an object in themselves, but only a means to make it good, pure, and wholesome. Let the food of the child be as simple as the circumstances in which he lives can afford.

"Parents and nurses should ever remember that simplicity and frugality of food and in all other natural needs, during these first years of the child, enhance its powers when he becomes a man, to attain happiness and vigour and true spontaneous activity.

"It is far easier than we think to promote and maintain the happiness and good of mankind. All the means are simple and at hand; yet we see them not. Because of their simplicity, naturalness, availability, and nearness, they seem insignificant. We seek help from afar, though this practical help is only in and through ourselves. At a later period half, or all, our great wealth cannot procure for our children what greater insight and a clearer vision would have provided beforehand."

## HELP FOR CHILDREN.

WHEN will we ever learn that it is not what we do for the child, but what we help him to do for himself, which is of value to him—that it is not what he has, but what he is, which brings happiness? The bequeathal of a fortune, no matter how princely, does not compensate for a weak and marred character, and the priceless gift of a strong, true training of heart and will is within the reach of every mother who is willing to prepare herself by thought and study upon this great subject of child-training, it matters not how humble her position may be.

## MEAT EATING A CAUSE OF BAD TEMPER.

AN interesting article appeared some time ago by Mrs. Ernest Hart, regarding the eating of meat being a cause of ill-temper. It would appear from Mrs. Hart's article that the domestic side of an Englishman's life does not bear favourable comparison with that of other nations, and this she attributes to the excess of meat diet. Comparison is made with the less meat-eating France, where urbanity reigns supreme, and with the rice-eating Japan, where politeness prevails even among the children in the street. Harsh words, Mrs. Hart avers, are spoken in Japan by the Englishman alone.

Whether this be so or not, we are inclined to believe, with Mrs. Hart, that the usual run of Englishmen who lead sedentary lives certainly partake too freely of a meat diet. Consequently the half oxidized albumen products throw extra work upon the liver, whose duty it is to convert all soluble forms of albumen into products capable of assimilation and nutrition. This may probably explain the cause why it is that people suffering from sluggish livers become so irritable and bad-tempered. Is it because the liver is sluggish, or that it merely needs stimulation on account of the extra work imposed upon it? We are inclined to believe the latter, for we see when we administer a good liver stimulant, such as a teaspoonful of Oppenheimer's Eucalymin Cocoa in a breakfast cup of boiling water prepared in the usual manner, and taken first thing in the morning, how the miserable feeling becomes dispelled. Unless the liver is kept in thorough going order it cannot cope with the extra strain imposed upon it. Mental and moral disturbance then occurs, for the imperfectly converted albumen products act as poisons to the system.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

## UNTO THE THIRD AND FOURTH GENERATION.

### HEREDITARY TRANSMISSION.

THE term heredity is now so commonly used as to have become a household word, though few who use it understand its potent significance, know the fixedness of the laws which in so subtle a way underlie and govern it in all its manifestations among men. Thus, many use it in a haphazard way, but it is well to understand clearly what heredity is, so far as we know and it is knowable. Heredity, then, really means, that biological law, by virtue of which all living beings tend to repeat themselves in their descendants; it is only in modern times that heredity, and still more recently criminal heredity, has come to be studied, to be regarded as a science, and the subject is well worthy of all the attention that may be given to it. It is a difficult subject to study, bristling with unseen and even untraceable psychological links, yet presenting startling results, which seem to spring from no cause. Some centuries ago the existence of the laws of heredity was vaguely surmised, and that was all, as we find only allusions thereto in some of the biographical writers. Plutarch and other writers are careful to relate the ancestry of the men and women who made themselves famous in the world.

Is it not curious that at the present time, when advantages of good descent are so generally discredited, when the doctrine that, one man is as good as another, has become so extremely popular in Europe and America, that just at this time we should have the fact demonstrated of the subtle influences of heredity and of the certainty of the effects of these influences on progeny? Science steps in and exhibits the falsehood of the doctrine of mental and physical equality—of the political dogma "of one man being as good as another," for science proves that there is, after all, a great deal in a man's ancestry as a factor in determining his moral character, his intellectual capacity, and his physical organisation. It is still true, therefore, that a silk purse cannot be made out of a sow's ear.

The researches of Mr. Francis Galton in England, of M. Theodule Ribot in France, and of Professor Cesare Lombroso in Italy, have resulted in the collection and classification of a mass of facts bearing on the question; and the inquiries which Mr. Galton began to institute twenty-three years ago, and which he has continued ever since, have been especially fruitful of valuable results; results readily intelligible to even those who have had no scientific education.

Let us state it as a general proposition, that a man's natural abilities are derived by inheritance, and under exactly the same limitations as are the form and physical features of the whole organic world; put thus, we find we have now a large and compact mass of evidence, the result of the labours of such men as those mentioned above, in support of such a proposition, and so far as to justify its acceptance, as the statement of an important biological law. Some of the most distinguished of European specialists receive it as authoritative.

The practical working in human life of this biological law is remarkable, and also the paucity in numbers of men who are brilliantly endowed mentally, when compared with the mass of human life, for it is estimated, and we believe correctly, that only 250 men in every million become eminent, an infinitesimal percentage indeed—in fact, nineteen-twentieths of the human race may be classed as mediocrities, safe, useful people, who by reason of the smallness of their mental endowments walk in grooves, and help to keep up that routine of living which we call society; this preponderating majority of ordinary common-place people is said to be invariable, for the facts that commanding ability is rare, and that mediocrity is so great is no accident, it happens from the very nature of things, it is a necessity from the impliability of the laws of heredity.

Scientific research on the basis of the impliability of the laws of heredity teaches us, that as there are so many murderers, so many idiots,

so many thieves per million, so are there so many men of conspicuous eminence. This matter of ratio, as we have said, appears stable. We are farther forced by investigation to the conclusion that eminently gifted men are raised as much above mediocrity as idiots are depressed below it; this fact illustrates in a remarkable way the great difference of intellectual gifts between man and man. Some students of this subject are so surprised by the greatness of these differences that they do not hesitate to say that many dogs are superior in respect of memory and powers of reason to many men, and those of us who have studied both dogs and the lesser gifted of men carefully will not dispute the statement.

Take any body of men from any of the learned professions, say law, which will suit our purpose very well, we can have a curious fact elicited by research as has been already done, that there is a regular ratio of increase of ability generation by generation, till it reaches its culmination, and then a similar proportionate decrease in the generations that follow. Why is this so? Why is it that when mental ability reaches by heredity its greatest development that there is immediate retrogression shown by descendants? It is assumed that in the first case the marriages have been consentient to its production, in the latter have been incapable of preserving it, and this is as far as we can go at present towards illustrating this fact. It has been observed that after the third generation, or three dilutions of blood, the descendants of learned and able men sink to mediocrity, they appear quite incapable of rising to eminence.

Another fact elicited by the student in the psycho-physical school of recent time, is that what we call instincts, are hereditary, if we can really differentiate these from intelligence, which appears doubtful, and instincts which originally were variable become stable in course of time, this stability shows that these instincts have been conserved and accumulated by the subtle laws governing heredity.

Descending to physical faculties of human beings, we perceive this law of heredity prevalent also, especially in the perceptive faculties which are more particularly susceptible of transmission from parent to child; for instance, keenness of vision is an essential requisite for the nomadic and savage races of man, and has, therefore, to be cultivated as a matter of necessity; this keenness becomes most exquisite by inheritance; this fact has been authenticated by reputable travellers, and by scientific men from personal investigation. The perfection of this sense of sight among the Mongolians on the great plains of Tartary is remarkable; it is said, on good authority, that they can perceive the satellites of Jupiter with the naked eye.

Acuteness of hearing is likewise transmissible as a hereditary characteristic; and this is true of deafness also; extreme delicacy of the sense of hearing is almost always the result of transmission from parent to child. Extreme delicacy of hearing is a necessity for musicians, who, if they are to be masters of their art, must have an attuned ear. The celebrated Andrea Amati, for instance, the famous violinist of Cremona, his two sons and his grandson inherited his acuteness of hearing; the lives of musicians furnish us with many examples. The father and grandfather of Beethoven were both exceptionally good singers, Bellini was the son of a musician, his grandfather was also a musician. Mozart's father was chapel master to the Archbishop of Salzburg, how wonderfully the inherited talent was developed in this great composer; Mozart's sister and his two sons were also gifted with musical talent. The most wonderful instance on record, however, of transmission by inheritance of physical attributes is that of the Bach family. This family, in a period extending from 1550 to 1800, during eight generations, produced so many as 120 musicians, and of these, twenty-nine attained to eminence in their profession. The Bach family in this lengthened period nearly always intermarried with musicians, and this would explain the persistence of this phenomenon beyond the usual limit of hereditary descent, the fourth generation, by intermarrying with musicians they kept up the strain in the blood, proving the doctrine, that when marriages are con-

sentient hereditary characteristics are continued.

The hereditary transmission of evil propensities, of vices is an assured fact; morbid inclinations and malignant passions are transmittable, like intelligence, to the third and fourth generation, when the inheritors very frequently die out, owing probably to the cumulation of evil within them, these, "by a law which is unsearchable, rid themselves," so says most truly a writer in one of the apocryphal books of the Old Testament when speaking of those whose habits have become inveterately corrupt. By these subtle but impliable laws of heredity the drunkard's children are drunkards, while besides, they often suffer from a general or partial atrophy of the brain; in the next generation or so of the same family the children may be insane or idiots, and thus the family ceases. This is the terrible law of criminal heritage, and it being thus invariably so, should not our legislators treat the morally leprous as the physically leprous were treated by the Hebrew law, and as they are treated by some modern nations, segregate the morally leprous and prevent them from propagating their species by prohibiting them from entering into marital relationships. This would really be a wise and humane way of dealing with them.

Modern French psychologists, such as doctor Despine and Labarde, state that crime is much more closely allied to mental and moral insanity than is generally believed, and these men are experts in the matter, having made morbid psychology their special study. Their testimony shows that after examining so large a number as 5432 criminals, they found one in every nine intellectually unsound.

Now, is not such valuable testimony as these medical men offer sufficient to cause every civilised community to look more closely into the matter of preventing the propagation of crime? Should not such men and women, who are really more dangerous to society than mere imbeciles, be segregated from the rest of the community, and be prevented from multiplying and producing a race of criminals? We most assuredly think that this is the right course to follow; for we must consider that men and women of this stamp are a standing menace to human life, property, law, and order. Here is the family history of one of these social rebels, a Frenchman, John Chretien. This man had three sons, Pierre, Thomas, and Jean Baptiste, all criminals. Pierre's son, Jean Francois, was condemned to hard labour for life, on a charge of assassination and robbery. Thomas had two sons, Francois, convicted of assassination, and Martin, executed for murder. Martin's son was transported to Cayenne where he died. Jean Baptiste's son, also Jean Francois, married a wife from a family of incendiaries, by whom he had seven children. The first of these, also named Jean Francois was an incorrigible thief, and died in prison. The second, Benoist, fell from the roof of a house while engaged in a burglary and was killed. Clain, who was the third, was also an incorrigible thief, and died young, at the age of twenty-five. The fourth child, Marie Reine, was imprisoned for robbery and died in prison; the career and end of Marie-Rose, the fifth, was similar. Victor was an habitual criminal, but how his life ended is not known. Victoria, the last of the seven children married, and does not appear herself to have been criminal, her son, however, inherited the criminal instincts of her family, and was condemned to death for murder. This is truly an appalling family history and affords very strong evidence of the reality and impliability of the laws of criminal heredity.

Now, should not such men as Jean Chretien be shut up? We should not then have such painful illustrations, as his family displays, of what a fearful thing criminal heritage is. Facts like these, which the family history of this criminal manifest, denote to our mind the impressive importance which attaches to these laws of criminal heredity, in their social and political as well as in their individual bearings and consequences. They demonstrate the necessity of a careful study of them by parents, by educationists, by medical men, by legislators, and by the executive who administer the laws. These facts also offer a scientific explanation of that stern warning and truth

of the sins of the fathers being visited upon the children unto the third and fourth generation.

## SHALL DOCTORS KILL?

THE question has been mooted lately whether a physician would be morally justified in ending the life of an incurable patient at the latter's deliberate request? It would be superfluous to discuss the legal aspect of the question, for as a principle a physician has no right to abridge life in his private capacity, and in practice a legal controversy of such a case would be of an extremely rare occurrence. In favour of the moral right, nay obligation, of a physician to terminate useless sufferings worse than death by the means at his command at the patient's own request, it has been said that a physician's duty is in no way and by no code of medical ethics limited to the mere abstract prolongation of life, that his task is far more comprehensive, and comprises in the first place the investigation of human suffering. When he sees that there will never be a compensation for this suffering by a restoration to health, or at least to a tolerable condition of life; when the patient himself considers life of no value in comparison with his misery, he has to consult his real and paramount duty, the relief of human suffering, without straining himself to the fictitious and imaginary duty of preserving life at all hazards.

So far the position might be conceded, but a momentous doubt begins as soon as we consider the possibility of a mistake in our diagnosis, and medical infallibility is by no means certain even in apparently clear cases of incurability. This view is strongly supported by the fact which has created quite a sensation in the medical world of Germany; for it was apparent that one of the most distinguished medical authorities, imbued with the above principle, but for fortuitous circumstances which took the patient out of his control, would simply have committed murder. He pointed in one of his clinical lectures to a woman afflicted with a neglected and "inoperable" carcinoma, whose condition was such that no hope of life was left, and that a strong morphia-injection would be a work of humanity. Six or eight weeks later the same woman was presented by another high medical authority of the same university to his hearers in a condition of considerable improvement. Her forces and her bodily weight had increased, she looked fresh and happy, and although certainly doomed to die after some years, she would have been deprived of a certain measure of human happiness if the first view had prevailed in her treatment. The eminent surgeon who had taken hold of the case after it had been declared incurable had performed prodigies of operative skill, among others, had dexterously removed a portion of the jugular artery, had rapidly prevented blood-poisoning by a preliminary operation consisting in the excision of the exterior ichorous portions of the carcinoma, and after that had chiefly applied himself to strengthening the dilapidated organism of the patient by roborating food and general diet.

In the numerous discussions which followed this episode, a medical authority of high standing surprised, not only the profession, but the thinking public, with a new and bold statement of the real task of practical medicine. "It is an exceedingly simple proceeding," said he, "to define preservation of life at any cost as the absolute standard of medical art, it is so nicely exact, coolly scientific, and, moreover in agreement with the precepts of a religion which in other cases men of science would not care for. All our views, especially our public hygiene, labour under this principle of preservation of life at any cost, transforming us in fact into the reverse of the Spartans, who exposed weak children and fostered the robust, while we generally give up vigorous men to all wars, perils, and the crushing struggle for daily food, while at the same time nursing cripples in body and mind with all the tenderness of a fashionable sport. It would be time indeed to limit in all these things the humdrum of

thoughtlessness to that measure which would satisfy our humanity, and which however would first take into account what is essential. Essential is to maintain and to increase the forces of those who are healthy for the purpose of rendering our race adequate to all problems of the future, and not to transform the world into a great hospital." There is certainly much truth in these considerations, but will it be easy to draw the line between a justifiable limitation of our efforts in favour of the weak and irretrievably afflicted, and their heartless abandonment or even deliberate elimination? This question is well worth the study of thoughtful readers.

## THE HISTORY OF HYGIENE.

EVER since his appearance on the earth, man, a prey to physical suffering, has been obliged to find remedies for his ailments. As Celsus has said at the beginning of his work on medicine, "medicine has existed in all ages"; but as it is easier to prevent than to cure, preventive medicine—that is to say, hygiene—was called into existence some time before curative medicine, and that hygiene, which proceeds scientifically by methods of deduction, was preceded by a religious hygiene. The prophet and the priest were the first doctors, and their ordinances for the public welfare rendered obligatory practical healthful duties for the prevention of disease.

In the form of fasting, of dietary, of food forbidden and permitted, of ablutions, and of bathtings, we see in all religions, in the sacred writings of the East, and in the precepts of Mahomet, the hygienic prescriptions imposed on the faithful in the name of religion.

A hygienic prohibition was imposed in the form of punishment. The discovery of the papyrus of ancient Egypt (those of Lepsius and Eber) show us that in that country, mysterious cradle of all learning, medical science was the secret of the priests, and Moses, adopted as he was by Pharaoh's daughter, was brought up in their philosophy, and so profited by the knowledge gained as to be able to transmit it to the Hebrews.

The sanitary precepts of the Bible, decreed by Moses, formed a complete system, comprising dietary, the prevention of contagious diseases, and the cleanliness of living places and of individuals. The priest (Cohen) is called upon to prove the first signs of an infectious complaint, the sentence of separation of the infected person comes from his lips. This isolation of the sick, which appears to us harsh and odious, was reasonable at a time when neither medicine nor methods of treating disease existed. This principle of isolation was largely applied, both to men and things. In cases of proved leprosy, of running issue, &c., it was said, "and the leper in whom the plague is, his clothes shall be rent and his head bare, and he shall put a covering upon his upper lip and shall cry unclean, unclean" (Levit. xiii., 45.). The sick person is then placed outside the camp. On the seventh day of isolation another examination of the sores is made by the priest, if leprosy then becomes evident the clothes of the leper are burned.

In case of the disease healing, the period of purification begins, the late leper remains another seven days in his tent. During this interval he twice bathes his body in water, shaves off all the hair of his head and his beard, and twice washes his clothes.

The house of the leper, like his person, is declared unclean, those stones which are infected by the sufferer are taken out, the walls are scraped, and in serious cases the house is even demolished. In the slighter cases the house is purified with the blood of a slain bird, with running water, and with cedar wood and hyssop. Does not one recognise in these prescriptions the measures which we take against epidemics? These religious ablutions ordained by Moses are merely secularised in our hydropathic treatment.

The Hebrew lawgiver enters into most minute details to preserve the health of towns:—"And thou shalt have a place also without the camp, whither thou shalt go forth abroad: And thou shalt have a paddle upon thy weapon, and it shall be when thou wilt ease thyself abroad,

thou shalt dig therewith, and turn back and cover that which cometh from thee." (Deut. xxiii., 12, 13.) He keeps a watchful eye over the beauties of the race, and defends alliances from anything approaching consanguinity, himself choosing a wife outside the house of Israel.

The dietary prescribed by Moses seems somewhat arbitrary. The Hebrews were allowed to eat all four-footed animals whose feet were cloven, and which chewed the cud. They must abstain from those which chewed the cud but whose feet were not cloven, as the camel. The pig was forbidden, although it had the cloven foot, because it did not chew the cud. The hare and the rabbit were interdicted as not having cloven feet.

Among the fish, all those which had fins and scales, in the sea, in lakes, or rivers were allowed them. Of birds, they were forbidden to eat the eagle, the great sea eagle, the kite, the vulture, and in general all rapacious birds; the raven, the ostrich, the owl, the screech-owl, the hawk, the cormorant, the ibis, the swan, the bittern, the heron, the lapwing, and the bat; things which flew and crept upon four legs, were to them an abomination; but they might eat of all four-legged things, which having longer hind legs, leaped upon the earth. The locusts of Jordan, which were enormous, formed the staple food of the Hebrews. St. John also considered this food a delicacy.

Apart from the utility of the prohibition of pork, often attacked by a disease supposed to be of a leprous character, one does not see the healthful aim of the series of prohibitions mentioned above. It has been claimed that these restrictions aimed at the use of animal food had for their object the prevention of the excessive use of flesh and the enforcing of a mixed diet, more conducive to the health of individuals and to the harmony of morals.

If hygiene lost nothing, on the contrary, by being placed in the hands of the priest, but owed to them its growth and arrival at a state almost of perfection, the same cannot be said of medicine properly so-called. In the theurgic period of medicine illnesses were regarded as divine and sacred visitations. The remedy consisted of appeasing an outraged deity with sacrifices. One may read in the book of "Deuteronomy" the vocabulary of evils with which God threatened the Hebrews by the mouth of Moses. By God's order Moses set up a brazen serpent, the sight of which should cure the stings of venomous snakes. So also it was in all primitive religions, the votive tables in temples of Æsculapius celebrated the miracles worked by God and witnessed the gratitude of believers. All this shows, according to the most ancient historical documents available, that primitive man attributed disease to the possession by evil spirits of the bodies of sick persons.

The trepannings of the skull in prehistoric times are not crude attempts at the cerebral surgery, but according to one of the most distinguished anthropologists, Paul Broca, it had only for its object the making of an opening in the head of the person possessed, by means of which the spirit in possession might fly out.

It is maintained, nevertheless, that medicine was cultivated among the Greeks more than among other peoples. Celsus names Æsculapius as the most ancient of doctors, and after him his two sons, Podalirius and Machaon, who accompanied Agamemnon to the siege of Troy. According to Homer, they did not know how to cope with all diseases, nor did they dare do so; sickness being of divine origin, they cured only such as occurred in consequence of wounds.

We must come to the time of Hippocrates in order to see medicine take its position in the company of science. He re-establishes it on the grounds of reason; every malady, he asserts, is due to a natural cause, and without a natural cause none can manifest itself.

It is the type of an eternal truth—that the soul's armour is never well set to the heart unless a woman's hand has braced it, and it is only when she braces it loosely that the honour of manhood fails.—*Ruskin*.

Of all the weakness which little men rail against, there is none that they are more apt to ridicule than the tendency to believe. And of all the signs of a corrupt heart and a feeble head, the tendency of incredulity is the surest.

## WORDS OF WARNING.

FROM THE *Daily Chronicle*.

THE march of the cholera microbe across Europe will be watched by everybody with the utmost concern. Indeed, if an army of barbarians were setting out from the East to ravage Western civilisation its movements could hardly be followed with acuter anxiety. So long as the cases which appear in the papers are confined to remote Russian provinces, the public mind remains comparatively indifferent. But when the dreaded scourge appears within sight almost of our shores, when we read of cases of cholera on British ships, and realise that some of our ports, in spite of the vigilance of our sanitary coastguard, have already had various warnings of what may be coming, it is natural that our minds should be exercised by what the autumn may bring forth. We may be justified in hoping that we shall escape as lightly this year as last. The Local Government Board, the various local sanitary authorities, and the medical officers of our ports are better prepared to resist and stamp out the first signs of the invader than they were a twelve-month since. The excessive heat from which we have been suffering has abated, which is another element in our favour. But, after all, we are dwelling in a fool's paradise if we fancy that a rigid course of quarantine and disinfectants is a safeguard against the cholera. What we want to be satisfied about is what sort of reception the cholera-germ would be likely to meet with supposing—and it is no far-fetched supposition—that it broke through our first line of defences. Have we any hot-beds in the ports or the inland towns or the rural districts ready for the microbe to make itself comfortable in, and where once installed, it might proceed to domesticate itself and settle down? We very much fear that the answer to such a question will not be of a cheering nature. We have no wish to raise a scare, but it is surely permissible to call public attention to plain facts, even at the expense of persons whose nerves may be shaken by their contemplation.

Take London. If cholera finds a footing anywhere in the island we may expect it at a point where the highways of the world converge. Our water supply is infinitely better protected from any possibility of assault than was the case in the last visitation, which was traced home to the fact that the sewage from East London found its way into the supplies of one of the great water companies. But the disconnection of the City's sewage from the supply of drinking water does not sterilise more than a given proportion of the conditions which make for the acclimatisation and multiplication of the germs. There are plague-spots in every great city, more than the average citizen has any conception of, to the manner born for doing the work of this Eastern despot. Water is a good fetcher and carrier, and it is something to know that this can no longer be impressed into the service; but there are plenty of other agencies. We must not forget that centres of social depression where the spirits and hopes and the bodily vitality of man have sunk to zero are still with us; that human beings are packed together by day in workshops and factories, and by night in brickwork and wooden compartments, breathing stale and poisoned air, and lapped round by all the desolating waves of poverty; that the very remembrance of Nature and her laws has been banished from the regions where these lower strata dip out of sight; that the agencies which make for elasticity and life are as nothing compared with the leagued forces of disease and death. The traveller who enters London over the wilderness of roofs and chimneys which stretch away for miles south and east of the City may realise dimly that there is some truth in this—that the bulk of the people who live in such an environment must needs lead stunted and unhealthy lives. There is a district in South London—not very far from London-bridge—where the death-rate is thirty-two per 1000, as against twenty for the whole of London, and where 259 souls are crowded together in each acre—the average for the whole of London being fifty-seven per acre; where out of every 1000 children born, 220 die

before they reach the age of one year; where the only recreation-grounds available are the disused burying-grounds of St. George's Church, Southwark, and the Lock burial-field, which are filled with the bodies of plague and cholera victims. In this place the work of several days out of the week of creation is undone. Light and air, birds and trees, cannot find room for themselves. It is scarcely surprising that the Rector of St. George's should have asked a well-to-do congregation whom he was recently addressing from the text of a medical officer's report, "Are we really Christians, and let these things be?" These things are, however, and for these things, though the lot has fallen on our conscripts up to now, we shall have to pay as a community. It is an established fact—one which can be expressed in a mathematical formula—that the death-rate of districts is according to their density. We get over the difficulty by pushing the poor more and more tightly into the congested town districts, and with the help of suburban villas and well-to-do streets the average works out fairly enough; though it does not take us much further to know that the death-rate of St. George's, Hanover-square, pulls down the death rate of St. George's by the Docks, if you add them together and divide by two.

There are other formidable and sinister facts besides these submerged districts—which, of course, are repeated in every port, and in greater or less degree, in every great city—which must be taken into account in any sanitary review of the situation. We have lately made it clear that certain workshops are not only condemned cells for those who work in them, but centres of danger for the consumer. The city which bakes its bread in holes underground, cheek by jowl with the sewers, cannot be congratulated upon its sanitary arrangements. If cholera were to come, we do not hesitate to say that the baker's van would often be followed at no long interval by the undertaker's men. Even if the cholera does not come, it might be well to get our house set in such order as to enable us to live in it with more or less of a good conscience.

## BURIAL ALIVE.

THE annals of Eastern nations furnish abundant examples of this custom, says the *British Medical Journal*, which has been resorted to from a variety of motives and under very different circumstances. The practice may be employed for the purpose of extinguishing life or maintaining life for a prolonged period without food or drink. There is, therefore, a fatal and non fatal kind of living inhumation. The most common description of burial alive (*jamadh*) is leper burial, which used to be very frequently resorted to in India, often at the request or urgent entreaty of the victims of this loathsome disease. A pit was dug by the relatives of the leper or by other lepers, and the unfortunate cast into it and smothered with earth. In some cases the wretch was burnt to death before being thrown into the pit. Opium water was freely drunk by executioners and executed on such occasions. This cruel rite lingered in Kashmir and some parts of Rajputana till within very recent years. Indeed, it is questionable whether it is even now altogether extinct. Lepers have been known in the extremity of their distress and misery to commit suicide by jumping into pits. Burial alive has also in India constituted a mode of *suttee*, or voluntary sacrifice of life, by widows who have been cast by sympathising and obliging relatives, at their own earnest request, into the same graves as their deceased husbands. Homicidal burial alive has been used as a means of punishment of crime, torture, revenge, or murder, and the burial has been in such cases either complete or incomplete. The non-fatal form of living burial has always excited more interest than the fatal, which, however, supplies material for a strange and large chapter in the history of human crime. The phenomenon of hibernation yields some

sort of countenance to the idea that the animal organism is capable, under certain circumstances—namely, conservation of body heat, perfect inaction, and preservation from all external stimuli—of living for weeks, if not months, without food or drink; and records of prolonged fasting, with or without sleep, are forthcoming with the regularity of the announcements of gigantic gooseberries, sea serpents, and eight-legged calves. The alleged proceedings of Indian fakirs and Persian dervishes are cited in support of the possibility of human hibernation in underground cells. The proceedings of these gentry must, however, be very liberally discounted. They certainly achieve some very extraordinary feats of endurance and self-abnegation. Their efforts to set at defiance the laws and inclinations of the body, and by contemplation, fasting, and neglect of the ordinary usages and requirements of life to mortify the flesh and become absorbed into the divine soul, which is, according to the tenets of pedantism, the spring and essence of existence, surpass physiological possibility and necessarily engender imposture, which may be conscious or unconscious, or both. This element of imposture, involuntary or designed, enters into all their proceedings, and is seldom either diligently looked for or detected. The love of the marvellous is strongly developed among Orientals, and fakir stories must be taken with a liberal grain of salt. Tales of prolonged living burial are common enough in India, but in no case has the proceeding been subjected to scientific observation or systematic watching; and in some instances the grave in which the devotee has proposed to hibernate has been uncovered after the lapse of a few days and its occupant found dead. When, therefore, we are told that Seymour, the thought-reader, proposes at Chicago to be buried alive and "remain underground long enough for a crop of barley to be grown on his grave," we incline to share the general impression that, if he carries out his plan, "he will probably remain underground for good."

## MY LITTLE BRIDE.

PLAINLY it was a hopeless case from the beginning, for she was a bride the first time we met, yet my heart was hers nevertheless.

Anybody might know that she was a bride, for she was dressed all in snowiest, purest white from the top of her pretty head to the tip of her dainty toes. Of course that was nothing strange for a bride, but you see this was her travelling dress, and only royal brides like the Princess May can wear white on their wedding journey.

I shall never forget the charm of that golden day—summer's crown of loveliness—when she came vision-like before me, a delicately-cut relief against a background of blue lake and still bluer sky,—the most perfect creature of all that perfect summer world. Her draperies fluttered in the soft caressing air like wings, or the sails and pennons of the little craft skimming the surface of the lake, and she looked like an inhabitant of heaven who had been beguiled by the promise of some minstrel breeze through the open door of Paradise.

Unquestionably she was as happy as the waves that in ripples of laughter chased each other up the pebbly beach. It was plain to be seen that life to her had been one joyous holiday, and lilies and roses her literal resting place.

As it often happens in meeting strangers, I found myself speculating at a wild rate concerning this rare little beauty. Who was she? Where did she come from? Where was she going? And confound him, who and where was he? Then I even dared to wonder if he would love her and care for her and make her as happy as I would, but most of all I marvelled how he could let her out of his sight.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scoury, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 6d., and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 33 or 132 stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

TO TOBACCONISTS (commencing).—*Illustr. Guide*, 250 pages, "Post Free." How to Commence. £20 to £1000. Tobaccoist's Outfitting Co., 186, Euston Rd., London. Manager, Hy. Myers. Est. 1868. Smoke "Pick-Me-Up Cigarettes."

# THE IMPORTUNATE FLY!

OH! that someone would arise, who would one day rid us of the numerous and importunate family of flies, whose little trunks attack without ceasing everything that falls within their reach.

Heat favours the development of these buzzing parasites and particularly that of the *musca domestica* or domestic fly, most common in our climate. In the state of larva, flies absorb for their nutriment the filthy product of animal and vegetable putrefaction. When fully developed the labours of a patient microscopist, Mr. Emerson, have shown that the insect feeds upon microscopic organisms, thus aiding to a great extent, the uninterrupted work of destruction which pervades life, and of which the fly is a veritable emblem.

Recently an Italian naturalist indulged in the following appalling statistic: It is known and proved that the fly under favourable atmospheric conditions produces as many as six generations annually. Beyond this it is known that this insect lays on an average eighty eggs at a time.

Supposing now that half of these eggs gives birth to females, the fly then produces in the first generation eighty flies, of which forty are females; these again in the second generation always at the rate of eighty eggs each time, give 3200 flies, of which 1600 are females. Continuing the calculation we arrive at the terrible conclusion that one fly will in the space of a year find itself at the head of one million one hundred and ninety two millions of descendants.

Admirably furnished by Nature with digestive secretions and apparatus of suction, flies gather while on the wing a load of diminutive and microscopic parasites, which they accumulate on the downy portions of their bodies. When they take up their position in any place (thanks to the suctional properties of their feet, they can maintain themselves in comfort on the most slippery surfaces) they scrape together with their forepaws all the parasites thus collected and absorb them with their suckers. The process of digestion is very lengthy, taken as it may be, as a work of pure cleanliness. (Charles Nodier disrespectfully names three creatures that spend a very long time over their toilet: Cats, flies, and women). But let us return to our hygiene, our *terra firma*.

The *Lucilia hominivora*, or golden neat-fly, is that which is most aggressive to the human race. It deposits its larvae in the cavities of our sores or wounds, it penetrates the nostrils of sleeping persons, and produces the most dreadful ravages. From this cause incurable hemorrhages, meningitis, and death are very frequent in certain countries, notably in Cayenne. Art happily intervenes through the medium of most of the turpentine and chloral lotions used as nasal washes, which alone are able to kill and expel the grubs of carnivorous flies. In our country we observe from time to time mendicants and drunkards thus devoured alive by the flies attracted by their ulcers and filth. In France, it is certain that many cases of anthrax and malignant pustule have been transmitted by flies—in Burgundy, and in the province of Beance, and even in Paris, in the beautiful quarters watered by the River Bièvre. This transmission would be impossible if, instead of being buried, no matter how deeply, all infected corpses were cremated without exception.

But other germs and virus can as readily be propagated by flies; small-pox, measles, and scarlet fever are as easily disseminated in this manner. Has not Grassi shown, by a number of careful experiments, that the feet of these insects transmit all infectious products? Now, with appetites eminently filthy, flies seek for and gather these products in every quarter. They seize upon the eggs of the tenia and trichina as well as on the shores of the ringworm; they revel in animal excreta as well as in vegetable decaying matter; then with supreme indifference they come and take up the position on our skin and on the food which we are eating. Spillman and Haushalter have clearly demonstrated our domestic *diptera* frequently carry in their intestines, the tubercular bacillus which they absorb from the sputum of consumptive people to which they are very partial.

Dr. Finlay, of Havannah, states that on that coast the germs of yellow-fever are carried very rapidly, and over great distances by the ravages of these insects. He attributes to the same influence of inoculation by flies the facility of acclimatisation, *bona fide* statistics prove the providential reality of this vaccination by flies. May it not some day be shown that the epidemic transmission of marsh or intermittent fevers, of which the means of inoculation in the human system are so remarkably obscure, may be attributable to the same cause?

All the authorities now admit the part played by flies in producing ophthalmia in Algeria and the Nile districts—the veritable living plague of modern Egypt. Again, the illustrious Koch recognises that these insects may in some cases readily become the propagators of cholera morbus, and Lonquet adds that in all epidemics the number of flies is a measure of the amount of the infection.

When one thinks of the actual difficulties of coping with these little pests (a most difficult and truly herculean task), one is hardly able to conceive the complete destruction of that winged parasite which we call the fly.

Let us after the manner of the Syrians, whom these fearful *diptera* never leave alone invoke to our aid Buzub, the Divine Flycatcher, who will help us to place before our readers the measures which hygienic science advises against these odious insects. We say nothing of fly-glasses or mechanical traps of cloth used chiefly in the country when flies are so numerous; they serve, perhaps, very well to amuse children, but are quite inefficient in trapping flies. To drive these insects of houses, places round about some *palma christa*, of which they have a great horror, keep it in the bedrooms during the daytime, darkness has the effect of driving flies away. It is in a great measure on account of the flies that houses in equatorial regions and in the East are kept so hermetically closed.

Whitewashing ceilings with a solution of carbolic lime, and sizing of paperhangings with a grain or two of corrosive sublimate, are equally effective against parasite of all kinds.

For the destruction of flies in water-closets, disagreeable as they are dangerous, here is the very judicious advice given by M. Charles, a well known chemist. Dissolve twelve and a half drachms of carbolic acid in nine and a half ounces of alcohol, add water sufficient to make up to fourteen ounces. Dip a brush into this mixture and sprinkle any holes in which flies may take refuge; repeat the operation for several days. The carbolic acid will kill most of the flies and will drive off those which it does not kill. Have recourse at the same time to scrupulous cleanliness, consistent with the avidity of flies for human secretions, which is part of their food.

To conclude, let us say with the humourist, "Father Noah must have been as drunk as a lord when he consented to take these hideous little beasts into the ark."

One may add, it is true, that these nasty parasites constitute one of the best proofs of the existence of God: for certainly (as some one has said) it can never be man that invented them. We conclude with the classical cry of the good Lhomond: *puer, abige muscas!*

## REVIEWS.

WE have received from the British Cycle Manufacturing Company an Illustrated Price List, showing a series of their Camden ladies' cycles and patented combination cycle dresses. From a careful perusal we are disposed to agree with the patentees, not only that ladies would do well to become cyclists, but that they cannot do better than patronise this company for their machines and costumes. Some of the latter are both graceful and ingenious, and will go far to render an exercise already acknowledged to be healthful and invigorating, not only attractive to the fair riders, but fascinating to those of the opposite sex who take their pleasure on wheels. We would especially recommend No. 1 Patent Combination Cycle Dress to our fair friends, as not only elegant but charming in every sense of the word.

## RECENT PATENTS.

This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.

15,140. An improved support for dental mirrors. ALEXANDER MCGOWAN DENHAM, 24 Southampton-buildings, Chancery-lane, London. August 8th, 1893.  
15,212. Improvements in trusses. BERNHARD LINDMAN, 4 South-street, Finsbury, London. August 9th, 1893.

### SPECIFICATIONS PUBLISHED.

12,111. BOULT. Treating diseases.

"PURE CEYLON TEA."—The increasing demand for a pure Ceylon Tea has induced HORNIMAN & Co. to specially import a selection of the choicest teas grown in that country. HORNIMAN'S "pure Ceylon Tea" is of wonderful value and of refined and delicate flavour. Sold by Agents in packets only, 5d. per 4 lb.

## CHILD MARRIAGES THE CURSE OF INDIA.

DR. CHUMOOLOLL, a pundit from Calcutta, recently gave some interesting information about his countrymen to an interviewer. He says:—

"The people are quite content and satisfied under the present British rule. Of course, the sentimental attachment to the old *regime* has by no means died away. There remains a feeling of regret for the times of past greatness as an independent race.

"Still, the domination of a foreign nation has been so long an established fact that pretty generally the existing order of things is accepted, and recognised by the natives, who quietly try to derive as much benefit as possible from the grafting of a new civilisation upon the oldest the world has ever known.

"The greatest curse of India and the greatest drawback to the development of my country is, in my opinion, the terrible child marriages that even yet obtain in a very great measure. The drain upon the vital energy, and the deterioration of the character of the people caused by this fearful custom be enormous.

"I often think I can trace its evil effects in the languor of my countrymen, in their lack of energy, of interest, of ambition, and in their passive acceptance of whatever is as the best. Certainly these marriages, being made without regard to the feelings of the married couple, are very frequently the source of lifelong unhappiness, and undoubtedly lead indirectly to much profligacy and to misery of many kinds."

Dr. Chumoololl, who possesses very decided views upon the subject, stated as his opinion that Christianity had not made the satisfactory progress its believers and teachers imagined.

"Many causes contributed to this," said he. "For ages long gone the various Hindoo religions were a great power. Still the natives were so habituated to them, that in the course of time, belief in them would have become a thing of the past through mere lack of interest.

"European interest in the subject, however, and the insatiable curiosity manifested by Western races in the ancient philosophy of the Hindoos, has perhaps served to fan the dying embers of these religions, and to keep them alive indefinitely.

"In any case belief dies so slowly, my countrymen are so conservative, they change only after the lapse of a great space of time, that I am inclined to the opinion that European civilisation will become the civilisation of the Hindoo until there remains only a fragment of the historic race of thinkers to whom the West owes everything; for, pardon me for reminding you, there is very little that is original in your philosophy.

"Theosophy has also retarded the progress of the people toward the acceptance of Christian doctrines. The subtle influence of belief in manifestations and interference from the spiritual world is very potent in causing believers to take little interest in the ordinary affairs of everyday life.

"But the influence of European association, wherever it has been allowed to have full play, has been of the utmost benefit. The natural genius of the Hindoo has been stimulated under the influence of keen competition, engendered by the establishment in their midst of European trading and manufacturing firms. This has resulted in the production and remarkable development of natives industries. The schools established by various European societies have also been remarkably successful, but I doubt if any practical results in the way of conversion to Christianity have been attained.

"The Hindoo has a very real horror of losing caste, and so will hold no communication with Christians; the natives without caste are, in a great measure, too indifferent to trouble themselves about a new religion, particularly a religion introduced by a people whom they blame for many hardships; for the advent of Europeans in India has not been without its drawbacks."

Dr. Chumoololl was asked if he had ever seen any of the Jogas or adepts, and answered with some disdain, that he had no belief in any of the pretended manifestations. "I think a great deal of good might result from the cul-

tivation of such moral modes of living and thinking as are so strictly enjoined upon the adherents of theosophy," said he, "but I must confess I have no sympathy with the Joga as ordinarily shown.

"I have seen many curious things. For instance, a man who swallowed yard after yard of linen cloth, and finally drew it back clean, smooth and without a mark, as though it had just left the shop.

"I have seen such as claimed, by virtue of long fasting asceticism, the complete domination of all passions, and the entire subjugation of the material part of their existence, to be able to penetrate at will into an unseen world, but I have never seen any performances or manifestations entirely free from suspicion or trickery."

## THE INTOXICATION OF HAPPINESS.

THIS is one of those wretched maladies of which the innocent victims ought only to inspire love and pity. It is shameful because it is the work of one's will; the patient, not from ignorance, but from remissness, dreading the duties of life, administers to himself a poison: alcohol, ether, chloroform, or morphine, which must needs enfeeble his body, blot out his intellect, and make of him a rotten stem, from which shall spring sickly branches of humanity—spileptic or imbecile tainted; in short, in the entire nervous system—the very marrow of our being.

To diminish or allay physical suffering has been the dream of all doctors. From the earliest times patients have been made to inhale or swallow extract of mandrake, and a thousand other experiments have been tried. Braid used to hypnotise by means of magnetic sleep. The many methods in use remained so for a long time inadequate or ineffectual, and Valpean in 1839 still wrote:—"To avoid pain in operations is a chimera which to-day we cannot pursue; a sharp instrument and pain in operative medicine are two words which are inseparable in the mind of a patient, and the association of which one must necessarily admit." However, in 1846, two Americans, Jackson and Morton, discovered the property possessed by ether in suppressing pain during operations. The problem was solved, and the great family of anesthetics became daily enriched with new members.

Fatal discovery, perhaps, for it has saved the lives of some patients, it has prolonged the martyrdom of others who were dying. These unfortunate anesthetics, stramonium, Indian hemp, morphine, &c., have so affected the vigour of thousands of human minds, that as many intellects have become atrophied or dulled; and suicide of the body is nothing compared with suicide of the mind.

The ordinary action of anesthesia, it would seem, should guard against any temptation to make use of it, except in case of absolute necessity. The sense of feeling is first abolished, a sort of veil covers the intellect, the haggard eye, which sees nothing, closes, and a semi-slumber, troubled at first by sturtor and epileptic contractions, becomes more and more profound. The whole being is reduced to a vegetative life, menaced even in its constituent elements; animal heat abates, respiration falls off, and the heart threatens to beat no more.

Anesthesia is then of itself a disease which may prove mortal, it is a last resource to save in cases of long and serious operations, necessitating the immobility of the patient.

One must choose, then, between anesthesia and death; but, nevertheless, this method of abolishing pain ought only to be decreed in virtue of a warrant given by someone other than the patient himself. What should we say of the person, who full of life and health, carries off to the medical sanctum a narcotic to kill pain, when he suffers only from an imaginary disease—*ennui*?

One of the faults of the medical profession has been to popularise the use of anesthetics, to squander them, and to employ them in short and but slightly painful operations; partly out of pity for the terrified patient, partly to spare itself the annoyance of resistance on the part of the refractory or timid. In short, thanks to the glass syringe and the judicious needle,

passing as easily into the flesh—the syringe mounted in ebonite, nickel, silver, or gold, according to the means of its possessor—the administration of anesthetics has become so easy and convenient, that one can hardly believe he ought to refrain from it. Again, chiefly in the large towns, those intoxicated by ether, morphine, and opium form a legion which disputes with the victims of alcohol the distinction of stocking the madhouses and laying the foundation of remotic diseases and lunacy.

The *Medical Record* of New York, according to the *London Standard*, maintains that *soirées* of morphine had become in a manner recognised institutions in certain Parisian circles, and it softly whispers the names of certain literary persons, whose brilliant imagination and untimely end had no other origin than morphine, haschich, or opium.

Some wish to erect a statue to Bandelaire, for it is usual to put forward a personal reminder of those authors whose books are no longer published. Should we not rather read again of this "fool's paradise"? We should see in the writings of a master hand, all the phases of the folly of taking the narcotics, at first the phase of pleasure, following that the phase of torture.

The opium eater first takes the poison as a relief to physical suffering. "An hour after having taken the tincture of opium all pain disappeared; but this benefit was nothing in comparison with the new pleasures which were suddenly revealed to him. What transports of the mind! What worlds of imagination! Is this, then, the panacea for all human suffering? Truly, oh, subtle and potent opium, thou possessest the very keys of Paradise!"

But these narcotic pleasures are not of long duration, farewell to hope and pleasant dreams.

The penalty soon commences: "A reflex of feelings sets in, when amazement in its turn was swallowed up, and I was abandoned not so much to terror as to a horror and abomination of all that I saw. Over every being, over every form, over every threat, there proved a sentiment of eternity and infinity, which brought anguish upon me with it an impression of distractions. . . . my terrors up to that time had been only moral and spiritual. . . . I was entombed for a thousand years in the stone coffins with mummies and sphinxes, in those narrow cells in the bosom of the eternal pyramids. I was embraced by crocodiles with cancerous kisses, and I lay huddled with a crowd of unutterable and slimy things amid the mud and reeds of the Nile."

Of two desperate conditions, the one caused by the continued use of poison, the other by despising the science of health, the celebrated but unhappy poet, De Quincey, whose history Bandelaire relates, chose that which offered one chance of deliverance; he diminished the doses little by little and got well, recovering with health his genius and his natural calm understanding.

The normal state of life properly understood and properly accepted, comprises all the sweet things that we ask of alcohol, ether, morphine, and the whole dangerous series of cerebral intoxicants. What of the illusions? Our whole life is made up of them, we deceive ourselves ceaselessly with regard to men and things, we see them as reflections of ourselves, and we make them according to that which our kindness and goodwill find in the view that we have of them. What of those moments sweet and rapturous? We have all had them, we have

## Linen Lasts Longer.

Your Clothes beautifully sweet, wholesome, lily-white, and fresh as sea breezes if soaked and washed with

HUDSON'S EXTRACT OF SOAP OR HUDSON'S DRY SOAP.

Shirt Cuffs will not be frayed or Collars jagged if Hudson's is always used.

all known those radiant hours, when we have walked intoxicated in the sunshine of happiness. Let us then above all things cultivate in ourselves and in others, that moral force which enables man to master grief by his liberty, his will, and his intelligence, a moral force which can lead us on to face material influences through the knowledge of the laws of Nature, and which gives to us, to all without exception, the full measure of happiness consistent with this life.

Let us not resign our happiness, but profit by the enjoyments so generously distributed to us by Nature. Let us follow the example of the tiny insect which works and plays in the perfume of the flower and in the beams of the sun.

## OUR OPEN COLUMN. CORRESPONDENTS' OPINIONS.

### MILITARY TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.

STR.—I find the following fresh instances in which the practice of tight-lacing in the Russian Army is mentioned:—

"Journal of the Waterloo Campaign," by General Mercer; Royal Artillery. (Published by Blackwood & Co., London, 1870. Chapter XXIII.

"A finer body of men than the Russians can scarcely be imagined, but to me their waspish waists appeared preposterous."

Then, again, a few pages further on: "They were a very fine set of tall, handsome, genteel-looking young men, dressed in scarlet jackets fitting like stays, and, as usual, the waist drawn in to the capacity of a decent grasp." I also find that General Woronzoff's Corps at the occupation of Paris, 1815, are described by Palmerston in his "Tours" as "Having their waists tightened to a degree that quite makes one feel for them;" and, with reference to this, he mentions the fact of the Grand Duke Constantine boasting that in his Corps the men are much better formed, and that General Woronzoff's corps cannot compare to them.

There is a book in my father's library in which life in the barracks, and at the Cadet College at Moscow or St. Petersburg, is described. I forget the details, but there is a long description of the waist tightening that was practised there early in the present century. Next time I am at home I will translate the chapter on this subject and send it to you if any of your correspondents would care to read the description of the vigorous treatment of the figures of these young men. I am unable to understand how such extreme lacing could be endured by men leading such an active life, but it appears to have in no way inconvenienced them when once used to the pressure.

—Yours truly,

A. WILLIAMS.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

"ORANGE" made marmalade in the spring of this year, which turned out well as regards flavour, but the peel is not sufficiently tender. She is very anxious to know how this could be improved upon.

ACCIDENT.—My daughter worked at a steam laundry, and

her right arm got crushed with the calender, so has had it taken off. Will any reader kindly advise me if the company are liable for damages, as I am very poor, with a large family? I shall feel thankful for any information how to proceed.—"Depressed."

### ANSWERS.

ADMIRATION AND OTHERS.—We are sorry we cannot conform to your wishes. If we did so, our columns would be full of similar enquiries. Our "open" column however, is at your disposal, but give full name for publication, and address for reply. We do not undertake to forward private letters to our various correspondents.

SKEGNESS.—Skegness is in Lincolnshire. It is a clean, healthy little place, with plenty of flat sands and meadows around it. Provisions are about the same price as in London; apartments half the price of those in places nearer the Metropolis. Capital little pony carts can be hired on the sands from 1s. per hour; also saddle-horses and donkeys. There is a fine pier, with entertainments; pleasure garden, with dancing; a switchback, and many similar amusements on the shore.—"George."

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR OF THE FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

THE PHYSICIAN. A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

### ADVICE GRATIS.

BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a *Postal Order* for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than *Thursday*, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on *Friday*. The answers to these will therefore appear in the issue of *Saturday week* following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

Hospital for Sick Children | London Hospital.  
St. Peter's Hospital. | Charing Cross Hospital.

HOPEFUL.—You have placed the state of things before us very clearly and succinctly. We wish your example in this matter were followed more largely by others of our numerous correspondents. We agree with you as to the cause and sequence of the conditions, and would advise:—1. On alternate nights the following powder: Calomel two grains, compound jalap powder twelve grains, powdered scammony three grains. Three powders to be made up. Each morning following the administration of the powder, let a pint of fluid be injected into the rectum: Common salt one table-spoonful, tincture of quassia four drachms, water to one pint. At bedtime nightly take a scruple of, bromide of potassium in water.

J. BURGESS.—You appear to have some congestion of all the parts in the lower regions of your body, though you do not say you are constipated, or that you ever pass any blood with the motions. If the bowels are irregular, take on alternate nights a teaspoonful of compound liquorice powder; drink neither beer, spirits, nor coffee, and take no sugar. 2. There may be a stone in the bladder, or the urine may be too strongly acid. Either of these conditions would account for these pains and hesitation. Take twenty grains each of bicarbonate of potash and bromide of potassium in half an ounce of infusion of gentian, half an hour after breakfast and dinner daily.

COMO.—1. We are glad to hear your health is so much improved under the treatment we prescribed for you. There is no reason why you should not contemplate matrimony by-and-by. 2. You may take the medicine during alternate months, for another six months at least.

EIN FRAULEIN.—1. Use an injection each morning for a week containing common salt one tablespoonful, tincture of quassia three drachms, warm water to one pint. Each preceding night take a dessertspoonful of castor oil. 2. This is merely a question of idiosyncrasy. Let us advise you, however, never to attempt the inhalation of chloroform unless administered by a competent medical man.

BURDENED.—You were rash to throw away your money on the apparatus named, which would certainly be of no service to you. 1. We cannot answer this question without a personal examination. 2. If the condition be as we suppose, an operation is inevitable. 3. If the operation be performed by a competent man, the swelling will not reappear. 4. You need not go to a hospital, but had better consult a specialist on these matters. If you send us a stamped addressed envelope, we will give you the address of such a gentleman. 5. The operation is not dangerous, and is often followed by complete restoration to health of the patient.

ISABEL.—We think you will find Beecham's lime juice and cucumber cream—a similar preparation—very useful. If that be unsatisfactory, which we do not expect, try vinolia cream, previously taking care to use vinolia or terebene soap. FRANK.—As the eyes at times "seem perfectly straight," in all probability your medical adviser is right. Under these circumstances we should advise you to wait a year or two longer before submitting him to any operation for the cure of the squint.

H. D.—Your troubles are all dependent directly on the "piles," indirectly on hepatic congestion, which is accountable for the congestion of the veins at the lower end of the rectum. Take a daily dose of compound liquorice powder. Give up your cigarette smoking, as well as whiskey, beer, coffee, and sugar. Eat your food slowly. Bathe the parts twice a day with cold water or cold tea, and take the following mixture: Dilute hydrochloric acid ten drops, sulphate of soda twenty grains, tincture of gentian half a drachm, infusion of buchu to half an ounce. Thrice daily before meals. When itching is present, do not scratch, but use cold bathing whenever possible.

TOMMY THOMPSON.—Your symptoms point not to a spasmodic, but to an organic stricture. The proper treatment is that by electricity, employed by a qualified specialist, not one of those whose advertisements are constantly before the public eye. If you send a stamped addressed envelope, stating that you desire the information, we will give you the name and address of a competent surgeon.

COLIN.—Every night at bedtime take a scruple of bromide of potassium in half an ounce of camphor water. Keep the bowels acting freely, with a daily morning dose (one teaspoonful) of sulphate of magnesia; learn to pass a bougie—No. 9 English gum elastic—twice a week, take a larger proportion of exercise, and write us again in a month.

GEORGE.—See reply to "Colin" in these columns. In addition, give up the iron and quinine at once, it is a clumsy method of attempting to treat such a condition, and is more calculated to aggravate than to relieve. Take instead, the following mixture: Dilute phosphoric acid ten drops, fluid extract of black willow half a drachm, infusion of gentian to half an ounce; three times daily before meals. 2. The charcoal will not hurt you, neither will it relieve your constipation.

BERTRAM.—1. Certainly. You would do well to undertake what are known as ointment injections, which must be used with specially made syringe. Ask your doctor to show you how to use them. Dilute thymol ointment half grain to one ounce of vaseline is a good application. 2. No. 3. To a certain extent. It is also very depressing, both mentally and physically. If you have any difficulty with regard to No. 1, write us again, enclosing a stamped addressed envelope for reply by post.

# IT IS ABSOLUTELY GUARANTEED

that **ONE** ounce of the nutritious constituents of **BOVRIL** contains more real and direct nourishment than **FIFTY** ounces of the purest Meat Extract.

Sold at Drug, Grocery, and Confectionery Establishments in 1/-, 1/9 and larger sizes.

## INVALID BOVRIL

A new pack of **BOVRIL** (put up in porcelain jars), which differs from ordinary **BOVRIL** in being more concentrated and devoid of seasoning, has been prepared specially for use in the Sick Room. Sold by all Chemists at 1/3, and (double size) 2/-

Manufactured by **BOVRIL, LIMITED**, Concentrated Food Specialists, **LONDON**

"The **FAMILY DOCTOR** contains a vast amount of really Practical Information."—*Reynolds*.

**ARCHIBALD.**—1. You should have persevered with the cold baths, not for three days but for three months or longer. How can you expect so short and spasmodic a course of adherence to treatment to be of any service whatever? Avoid beer, spirits, coffee, sugar, and pastry. Eat any ordinary food in reasonable quantity, and slowly. 2. No living man can answer this question. 3. We hope not, but without personal examination of the parts a definite reply is impossible. 4. Certainly not now. Perhaps in two or three years it may be advisable, under certain circumstances, and with energetic and proper treatment possibly sooner. 5. Take fresh fish at least three times a week. Try Frame Food occasionally. Let us hear again from you shortly, as we shall be interested in the progress of your case.

**SCORIBLER.**—It is of more consequence that you should be cured than that you should be able to take stimulants. We should advise the following mixture to be taken regularly after each meal in an equal part of water: Solution of perchloride of mercury twenty minims, iodide of potassium ten grains, compound decoction of sarsaparilla half an ounce. Take this medicine regularly for two months, then write again detailing your progress.

**A LONG SUFFERER (G. S.).**—Your case appears to be a somewhat curious one, but you have only suggested the merest outline of a description, telling us nothing as to your occupation, habits, diet, history, &c. If you will fill in these blanks, and add any details that may strike you as being of importance, we shall be glad to advise you.

**F. C.**—1. You should wear an elastic knee-cap, made to fit you properly. 2. As the cramp appears only to occur on Saturday nights, there must be some special reason, acting only on that day. Is it overwork or strain, or do you take too much to eat or drink late at night after work is done? If so, remove the cause and the effect will probably follow suit.

**PAINFUL (D.).**—Why don't you tell us something about the "case"? Have you had rheumatism or gout? Have you varicose veins in the legs or thighs? Are you constipated? Do you stand much? Is your food what it ought to be? Do you drink beer or spirits? We do not think the sprain has much to do with your trouble, but if you answer these questions we shall be able to give you a more definite opinion.

**R. EVANS.**—Your description is not an accurate one, and does not help us at all to a solution of the difficulty. We can only suppose you are mistaken in speaking of "fat of many colours" as rising to the surface of the urine. The "scum" may possibly be due to another cause, the sediment as well. Take the following mixture before each meal: Dilute hydrochloric acid ten drops, chloride of ammonia ten grains, infusion of buchu to half an ounce. Keep the bowels free, take plenty of exercise, no beer, coffee, or sugar.

**835.**—We are constantly giving advice in these columns for conditions similar to your own; however, we will repeat it. Take more exercise, a daily cold bath, do not sleep on your back, rise on first waking to empty the bladder, keep the bowels free, and night and morning take a dose of the following mixture: Bromide of potassium twenty grains, tincture of hops twenty drops, infusion of gentian to half an ounce. Eat your food slowly, making fish a prominent factor in your diet. Write again in a month, reminding us of this answer.

**HOMINY.**—1. Take five grains of iodide of potassium night and morning in a wineglassful of milk, use a suspensory bandage, and apply some iodide of potassium ointment (B. P.) to the part twice a day. 2. We should be inclined to say so, inasmuch as oatmeal occasionally sets up irritation of a certain type.

**YE BATH BUN.**—1. Artificial stimulation of all kinds is undoubtedly injurious, and should be avoided as far as possible. 2. Why don't you try? At any rate, lack of success would not make matters worse than they have been all these years, while the contrary luck might do you a great deal of good in various ways.

**SELLERS' CLEANSING AMMONIA** is a perfect boon to every household. A little added to the Bath softens the water, cleanses the skin, promotes health and vigour, and secures all the benefits of a Turkish Bath without any risk or inconvenience. It is most refreshing for Toilet use, and makes a splendid wash for the Hair. For Laundry use it saves Soap, Soda, and Labour, prevents flannels shrinking, and makes Linen as white as snow. In bottles, 6d. & 1s. each, with directions for use. Sold by Chemists, Grocers, &c., or from J. SELLERS, 57, Farringdon Road, London, E.C.

**KNITTED CORSET CO.,**

44, MANSFIELD RD., NOTTINGHAM.

**MISERABLE.**—Use the following lotion every night to the scalp: Tincture of cantharides four drachms, tincture of capsicum four drachms, rose-water to eight ounces. Clip the ends of the hair once a week, and give up the coil.

**J. E. F.**—The eruption is dependent upon chronic indigestion. The fact of your having squeezed out one of the spots has nothing whatever to do with the appearance of the subsequent crop. Smoking to excess is much more likely to be the cause. You must, therefore, give up the habit at once—at least, until your face is better. Give up also the sulphur soap, which is calculated to irritate the skin, and to aggravate the trouble. The advertisements are what you describe them. No external application, of whatever nature, can cure a disease due in part to internal causes. Take less food; eat what you do take as slowly as possible. Drink only when your meal is finished. The following mixture will help you to relieve both troubles, both being due to the same causes: Dilute hydrochloric acid ten minims, sulphate of magnesia half a drachm, tincture of gentian half a drachm, water to half an ounce, three times a day before food. Keep on using the hot water as before, and try vinolia or terebene soap.

**DESPONDANT.**—Have no fear of that which in your case is a very unlikely contingency. Probably the medicine ordered by your doctor is accountable for the lack of excitability. Give it up and take the following: Dilute phosphoric acid ten drops, tincture of nuxvomica ten drops, fluid extract of black willow half a drachm; water to half an ounce. Three times daily before meals.

**T. K.**—We regret that your original letter has not come into our hands. If you will write again, detailing your symptoms, we shall be happy to do all we can to help you.

**THE VICTIM.**—Your letter gives us no very definite idea of your condition. You have already consulted several medical men, who all appear to have made a distinct diagnosis. It is so difficult to diagnose the case after examination, how much more so must it be from a mere written statement. You had better send a stamped addressed envelope for the address of a specialist in these diseases, at the same time as you care to have such advice.

**AID.**—We regret that we are unable to assist you in this matter. However the result you fear may not follow, provided no further risk is run.

**VINOT-TOIS.**—Take the following pill daily with dinner: Extract of cascara sagrada one and a half grains, pill of colocyth and henbane two grains; take also a glass of cold water each morning on rising.

**ELOC.**—We should advise you to avoid both these sets of advertisers. The appliances mentioned are like the famous razors—made to sell. If you do not wish to undergo an operation, which would be the best thing for you, get a properly made suspensory bandage, which will at any rate act as a palliative, if it do not relieve you altogether.

**CONSTANT READER, OF "F. D."**—Drink no beer or coffee, take no sugar or pastry, give up smoking, and take a dose of the following medicine three times daily between meals: Bicarbonate of potash fifteen grains, tincture of henbane, half a drachm, infusion of buchu to half an ounce.

**CAMP.**—We are glad you have so good a report to make. Persevere with the treatment for four weeks longer, then write us again.

**SOPHISTO.**—1. Yes. These are signs of what is called biliousness. Take a daily morning dose of sulphate of magnesia one drachm, carbonate of magnesia ten grains, nitrate of potash eight grains, peppermint water to half an ounce. 2. The medicine ordered under 1. will help to do so, provided you become a total abstainer. 3. Both before and after, and in some cases also during the interval.

**SHAMROCK.**—Indigestion, liver disturbance, constipation, concentrated urine, precipitation of urates. So much for the complaint. Now for the treatment. Avoid sugar, stimulants, tobacco, too much meat, either fresh or preserved. Partake more freely of milk, lemon-water (without sugar) green vegetables, uncooked fruit, fresh fish. Take every morning the mixture prescribed for "Sophisto" in these columns, and eat your food slowly.

**KISMET.**—See answers to "Sophisto" and "Shamrock." We do not think the discharge you complain of is anything to do with the old attack. Sedentary employment, insufficient ventilation, lack of fresh air, and of proper exercise are chiefly to blame. Take also the following mixture twice daily between meals: Carbonate of ammonia three grains, bromide of ammonium ten grains, tincture of gentian half a drachm, water to half an ounce.

**MISERABLE.**—Try the effect of the following inhalation, used twice or three times a day, after your work is done: Compound tincture of benzoin one ounce. Half a teaspoonful to be added to a pint of boiling water, and breathed through nose and mouth until the water cools. Keep your bowels acting freely, and avoid impure (dusty) atmospheres as much as possible.

**X. Y. Z.**—1. The address given is quite sufficient. Address your letter to "The Secretory, Connaught House" at the place named in your letter. 2. Raw rice or tapioca are manifestations of hysterically perverted taste, and are likely if persisted in to set up not only indigestion with consequent anemia, but possibly to be the cause of sudden death. If your friend does not give up the habit at once, she will very soon be beyond the reach of human help; for the quantities she takes are enormous. No medicine will be of service until she ceases to eat these things.

**AMEN.**—1. No surgeon in this country would undertake the operation. It is not permitted by law. There are, however, other methods of getting over the difficulty. Half an hour's conversation with a specialist physician would probably put you on the right track. Meanwhile, do not be discouraged, but seek to overcome vice by determined resistance at the first approach of temptation.

**E. L. P.**—In the usual way, a man does not require such assistance, though where there is any nervousness it may be of service. 2. Several inches. 3. Occasionally there may be a considerable quantity, at other times there is scarcely any. 4. One to ten minutes, or longer. 5. Yes. Such conditions as those of which you complain are not at all uncommon, but you will readily understand how impossible it is to enter fully into them in these columns. If you wish for a more detailed reply, you had better send us a stamped directed envelope, restating the main points, when we will endeavour to help you as far as possible.

**J. MATTHEWS.**—We are afraid your description is not sufficiently full to enable us to diagnose your case. You do not say whether the lump in your throat ever disappears, or whether it is constantly present. Try the effect of an inhalation of half a teaspoonful of Friar's Balsam added to a pint of boiling water, and breathed through the mouth and nose twice or three times each evening. Should this not help you, write again in a few weeks.

**B. A. S.**—1. Yes. 2. Yes, the chemist will arrange convenient quantities. 3. Any good chemist will have the instrument, and will tell you how to use it.

**YARDSTICK.**—1. The lumps described are suggestive of a more recent infection than that you name. It will be necessary that you should undergo personal examination at the hands of a specialist physician, in order that a reliable diagnosis may be arrived at. 2. We should be sorry to say it is safe for you to marry until this matter has been cleared up. It may be a matter of no consequence; on the other hand, it may be the commencement of syphilis, which is a serious complaint, and will need energetic and constant attention.

**AMARDA.**—1. The B. palatinoids are ready for taking, as they are made up in capsules, more readily swallowed than most pills. 2. Bathe the eyes twice a day in cold water, and if necessary, afterwards in cold tea.

**CYMRÖ.**—The medical men who have given you their diagnosis are probably accurate in opinion given you by the chemist means nothing, and is worth the same. You cannot obtain relief for psoriasis by external applications alone, and internal treatment is necessary. We would suggest your taking the following medicine: Fowler's solution (five drops) i carbosate of potash ten grains, infusion of buchu to half an ounce. You may continue to use the present external application, as it seems to agree with your skin. Take the medicine ordered for three weeks, then write again.

**A NEW READER.**—The loss of energy and power may be in part due to the cause suggested, but we are inclined to think there must also be something wrong with your diet or your mode of taking food. Do you eat your food quickly, or drink much beer or spirits, or do you smoke to excess? If so, see that these habits are corrected at once. Take each morning the following mixture: Sulphate of magnesia one drachm, carbonate of magnesia ten grains, nitrate of potash ten grains, peppermint water to one ounce.

**LA FETE.**—1. The pains are partly the results of former habits, and partly due to liver disturbance. Take the following mixture: Bromide of potassium twenty grains, chloride of ammonium ten grains, dilute hydrochloric acid ten minims, infusion of gentian to half an ounce. Three times daily before meals. 2. Once a fortnight, or less frequently. If they occur at a shorter interval, they are apt to be harmful, both to your physical and to your mental health. Without examining the pills it would be impossible to say whether any damage has been done to them, and without further information as to the physiological state we should hesitate to advise marriage for the present at any rate.

**J. C. STEPNEY.**—Give up the beer, as well as coffee and sugar. Take more exercise, and every day with dinner the following pill: Blue pill one grain, pill of colocyth and henbane three grains. On alternate mornings a dose of mineral water taken hot, before rising, will do you good.

**PERPLEXED FATHER.**—You have rightly chosen a non-plume descriptive of a state of mind for which you are yourself largely responsible. As principal of an institution such as yours, you should long ago have learned: 1. That the training of lads of seventeen years of age or thereabouts, by girls of about the same age is distinctly inadvisable—even wrong, speaking generally. 2. That boxing the ears, or other corporal punishment, even when administered by a man, is degrading to the lad, and so far from being beneficial, is calculated to do him an infinity of harm in a multitude of ways. Corporal punishment in schools, except for very young children, is always a mistake, for it is certain to brutalise the victim and to stimulate in him feelings of anger and revenge, which, pent up for the time, later on in life expend their force upon defenceless animals or persons. 3. That the effects upon your daughter and niece of being allowed to administer such punishment to lads above the age of puberty are calculated to demoralise them in a way which you possibly do not appreciate, but which it is a physician's duty to acquaint you with at once. You doubtless read German. Let me advise you to read without delay the work on "Pædyopæia Sexualis, by Dr. R. Von Kraft-Ebing, Professor of Pædyatrie and Neurology at the University of Vienna. In Section D., on Paræsthesia of Sexual Feeling, you will find a chapter on seduction. Read that chapter carefully, and after a dispassionate perusal you will agree with me that such methods as you have permitted to be employed by your daughter and niece, and which you have described in minute detail, and with apparent satisfaction, are not only demoralizing, but disgraceful. Will you allow me to add that the mere fact of your assenting to such proceedings indicates that your own sense of the fitness of things must be to a great extent perverted, and that your plan of "training" is wrong *ab initio*. In your letter you have asked me to give you my professional advice on this matter. I have done so; but you must forgive me for at the same time expressing my horror at the possibility of such occurrences in a country claiming to be civilised.

"The FAMILY DOCTOR is Carefully Edited and meets a want that has been long felt."—*News of the World*.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scuffs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

## THE ATTENTION

Of our Readers is respectfully drawn to the fact that we Published a SPECIAL NUMBER of the FAMILY DOCTOR, dealing with the

## THREATENED CHOLERA EPIDEMIC,

on August 12th, 1893. The number containing articles on the

ARTIFICIAL CULTIVATION OF THE CHOLERA SPIRILLUM.

WHAT IS CHOLERA? CHOLERA AND BEER.  
A ROOM FOR SICKNESS.

CHOLERA PROSPECTS AND PREVENTION.

A few copies can still be obtained by writing to the Publisher, 18, Catherine-street, Strand, W.C. Post Free, 1½d.

## PHRENOLOGY

has for the past few weeks had a fair and impartial discussion in these columns, but now we must perforce for the present cease to publish any more letters, either for or against.

## EDITORIALS.

**DO WE EAT TOO MUCH?**—To this question many modern physicians answer, "No," although nearly all ancient and most modern writers upon health have insisted that the contrary is the case. Those who advocate liberal feeding claim that Nature has made provision for the disposal of any surplus of nutriment, and hence that no harm can come from over-indulgence in gustatory pleasures—at least as regards quantity. These theorists, in their anxiety to afford encouragement to the glutton and the epicure, seem to forget that vital energy is of any value. They seem to quite lose sight of the fact that the vitality

consumed in digesting the excess of food taken into the stomach might possibly be put to some better use. They also appear to be oblivious to the fact that the elimination of the crude products of imperfect digestion from the blood is a task which requires the expenditure of a still larger amount of vital energy upon the part of the kidneys, liver, and other eliminative organs, thus not only over-working them, but diverting them from their proper work, and so working serious mischief in the vital economy. We are thoroughly convinced, from personal experience and observation, that the majority of persons eat too much. Over-eating is one of the most frequent causes of the almost universal dyspepsia of this country.

**CUTTING OFF SUPPLIES.**—The eminent Dr. Tronchin, of Paris, considered abstinence from food as the best of all remedies for disease, probably because he regarded most disorders as the result of overfeeding, a conclusion in which we heartily agree, at least if bad feeding is included. "Good generals," said Dr. Tronchin, "always attempt to cut off the enemy's supplies. I put my patients on spare diet at once, and bring the enemy to terms by famine." The great Napoleon seems to have had the same idea. "When I am not well," said Napoleon, "I fast, bathe, and rest. If I am taken sick while I am resting, I exercise. If taken ill while hard at work, I rest; but in all cases, I fast. I find that is all I need."

It is not overwork, except at the table, that causes so many to break down. There is a great deal more softening of the liver than softening of the brain; too much exercise of the jaws, and not enough of the muscles. People are dying everywhere of physical excesses of useless expenditures of vitality. Probably five-sixths of the constitutional vigour of every man and woman is wasted, and the last twenty or thirty years of their lives are eked out miserably in consequent pain and discomfort.

**DARKENED SICK-ROOM.**—The custom, in spite of modern sanitary teaching, still prevails of keeping the occupant of a sick-room at all hours in a darkened room. There is no sense in this; it is as if the attendants were anticipating the death of the patient; and, if the reason is asked for, it is as inconsistent as the act. The reason usually offered is that the patient cannot bear the light—as though the light could not be cut off from the patient by a curtain or a screen, and as though to darken one part of the room it were necessary to darken the whole of it. The real reason is an old superstitious practice connected with small-pox and other terrible diseases involving the exclusion of light. A more injurious practice really could not be maintained, as by it a great remedy is lost. Sunlight diffuses through a room and warms and clarifies the air. It has a direct influence on the minute organic poisons—a distinctive influence that is most precious—and it has a cheerful effect upon the mind. The sick should never be gloomy, and, in the presence of the light the shadows of gloom fly away. Happily this fact is now recognised in hospital practice, and should be equally so in private practice.

**FAINTING FITS.**—Fainting proceeds from different causes, the commonest being a disturbance in the circulation of the blood in the brain. For an ordinary fainting fit lay the patient flat. Great harm is often resulted from the treatment of ignorant people in trying to make the patient sit up, or propping up the head with pillows. To send the blood back from the heart to the brain, the flat posture is absolutely necessary. Let the patient lie so that the feet are higher than the head, throw the clothes about the chest and throat open, sponge the face with cold water, and give some cold water to drink.

**A FREE EXCURSION TO THE COAST** at this time of the year would be an acceptable boon to many a hard-working man, but as such an instance is hardly likely to occur in these dull times, the next best thing a poor man can do, instead of getting change of air and scene is to purify his blood and cleanse his system with a few doses of Holloway's Pills. This wonderful medicine for many years has been a blessing to the commercial world; it gives tone to the system and purifies the blood, and rapidly increases the strength of the brain. It also cures indigestion in its most advanced form, and in cases of nervous debility it is without a rival.

**CHEMISTS** now turn scrap iron into ink, old bones into lucifer matches, the shavings of the blacksmith's shop into Prussian blue, fusel oil into oil of apples and pears, the drainages of cow-houses into fashionable perfumery, beggars' rags into new coats, and tar waste into aniline dyes and saccharine.

**WATER PURIFIED BY IRON.**—The filthy water of the River Nethe is purified for use in Antwerp by being passed through revolving cylinders containing small pieces of iron. Fifteen pounds of metallic iron will purify 1,000,000 gallons of water. The water thus treated is said to be completely freed from germs, bacteria, and other objectionable matters. English and French chemists find that the contact with iron reduces the organic matter by from 45 to 85 per cent. and albuminoid ammonia by from 50 to 90 per cent., and all free ammonia is removed.

**HOW MUCH TO SLEEP.**—Someone says of sleep, "Six hours for a man, seven for a woman, and eight for a fool," but there never was a more misleading statement. The amount of sleep one needs depends on the amount of mental work he does while awake. Men whose brains are never busy can get along with five or six hours' sleep a day, even though their hands are always employed during the waking hours, but the mental worker must have more or go crazy. To attempt to imitate Napoleon, who, it is said, could get along with four or five hours' sleep, will drive any ordinary man into an insane asylum before the end of a year.

**MILK FOR INVALIDS.**—The use of milk and eggs as a diet or an aid in building up a patient is often a trial to the nurse. Many patients will take milk slightly warmed, or even hot, and digest it readily, when cold milk causes distress. It is an excellent plan to rinse the mouth with cold, cool, or hot water, as preferred, before and after drinking milk. The taste left in the mouth of many persons after a drink of milk, especially a small quantity, often causes the patient to dislike it. The secret of success in giving milk and eggs to those who would rather not take them is to prepare them in different ways. For a delicate stomach the white of an egg, well-beaten, added to hot or cold milk sweetened to taste, will often prove tempting, when even the sight of the yolk with milk is unpleasant. After a time a little of the yolk may be used, the white of the egg being added last, and not stirred into the milk, but left at the top of the glass for ornament.

**A PERIPATETIC HYPNOTISER.**—Good-looking young women who travel on the tops of Paris omnibuses are threatened with a serious danger. There is a man, says the Paris correspondent of the *Daily Telegraph*, with fascinating eyes, going about who is called the "peripatetic hypnotiser," and every female who falls a victim to his glare becomes as unconscious as any of the subjects in the Salpêtrière Hospital. The latest victim of the mesmerist or hypnotiser is a young dressmaker, who was travelling on an omnibus from the Wine Market to the Place Pigalle. When the vehicle stopped at the last-mentioned place everybody had to get down. The dressmaker did not do so, and the conductor was surprised to find her not only fast asleep, but absolutely proof against his most energetic attempts to wake her up. After innumerable and unavailing pushes, shakes, and pinches, the conductor, aided by his driver, carried the somnolent sempstress to a chemist's shop, where she was recalled to consciousness. Her trance lasted nearly two hours. On awaking she said that a young man who was near her on the top of the omnibus had fixed his eyes firmly on her, and she fell asleep almost immediately. The omnibus conductor stated to the police that there had been a young man near the dressmaker, but he could only give a vague description of the dress and appearance of the traveller with the basilisk glare, who is now being sought for by detectives.

**TIGHT LACERS.**—Ladies and Gentlemen's Corsets Fitted Personal visit not necessary. Self-measurement form free by post. Satisfaction guaranteed. Best qualities. Lowest prices. Close fits for Professionals. Neatness, comfort, health. **FORD AND PARR**, 141, Stockwell Road, London, S.W. Estab. 1866.

"The FAMILY DOCTOR is a Popular Periodical, and contains many useful Notes."—*Morning Post*.

**HOW TO RESTORE DROWNED PERSONS.**—Everybody may be called upon at any season of the year to afford assistance to drowning persons, while the doctor is being sent for, and Professor Laborde's simple method for restoring breath when all other means have failed deserves to be universally known. A Paris correspondent tells us that, at a watering place in Normandy, two bathers, a young man and a boy, who were unable to swim, went out of their depth and disappeared. They were brought on shore inanimate, and were taken to the village. Two doctors were sent for, but the young man gave no sign of life, and they declared he was dead. M. Laborde, who was fishing at half-an-hour's distance, came up as soon as he heard of the accident. He examined the body and found that the extremities were cold and the heart had stopped. Then, taking hold of the root of the tongue, he drew it violently forward, giving it a succession of jerks in order to excite the reflex action of the breathing apparatus, which is always extremely sensitive. At the end of a few minutes a slight hicough showed that the patient was saved. In addition to the usual restorative means, Professor Laborde, in extreme cases, rubs the chest with towels soaked in hot and nearly boiling water, although the skin is blistered by this.

## DOMESTIC SURGERY.

### USEFUL FOR THE HOUSEWIFE.

[Special Article.]

Written and Illustrated by a SURGEON.

(See Frontispiece.)

THE sight of blood has such an alarming effect upon most persons that a very small wound indeed, one requiring the most trifling attention, finds its way into the surgery or chemist's shop.

Now it stands to reason that if a chemist, whose professional education is not supposed to extend beyond the compounding of drugs, or at furthest to subjects incidental to chemistry, can patch up a wound successfully, that there must be many cases at home that a collected and sensible individual might do for themselves or others, without either running the risk of medicated surgery at a chemist's shop, or going to the expense of genuine professional attendance—a medical man has as much right to charge for putting on a strip of plaster over even a skin-wound as any other skilled workman has a right to be paid for his labour. The cost of the plaster, or strapping, or even the full extent of lint and bandages, is not very great; it is for the skill displayed that you have to pay, and that may very often be, from the real insignificance of the injury, very little greater than might be found at home, with a little instruction and exercise of common sense.

It must not be supposed for a moment that we advocate any attempt to interfere with serious cases—beyond perhaps a temporary assistance, which may often save life, if promptly provided, and of which we shall speak in due time—for by over confidence—or shall we say presumption?—a life might be endangered—the little learning proving a dangerous thing, and its exercise should be discouraged when danger to life or permanent injury to limb might result.

We will commence by giving directions as to the treatment of the smaller injuries to which we are constantly liable, such as cuts of the head, face, or hand, and especially of the fingers.

Accidents will happen even in the very best regulated families, and do happen, and always without any previous notice; so that it is as well to have your weapons ready, and these may be very few and simple.

A strip of diachylon plaster, or strapping as it is termed, may be bought by the yard.

A roll of lint—the best is always the most useful.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

Bandages—which may be torn from a length of unbleached calico. For most purposes of immediate want three yards will be found to be long enough; longer ones, if necessary, can be prepared afterwards, as also can flannel webbing or other special rollers.

The three yard strip of unbleached should be torn into widths of one inch, and one inch and a half and two inches, and rolled firmly in a manner to be hereafter explained.

A sheet of cotton wool is often useful, especially for burns, and for that same purpose a bottle of Carron oil—equal parts of olive oil and lime water shaken together until they form a thick cream—should be stored away ready to hand.

A sharp pair of scissors should also be devoted to surgical purposes.

Needles and wire or silk twist may be found useful in districts at a distance from medical help; but, unless the necessity of the circumstances are such as to render the obtaining of skilled assistance next to impossible, the knife and the needle should be left unattempted.

There are several other little instruments that may be added to the store to make it perfect that experience will point out, such as an instrument for removing "foreign bodies," as they are called—meaning fish bones, buttons, false teeth, or other things from the throat; injection syringes; flat-pointed tweezers for removing thorns and splinter; an abscess knife; gum lancet; probes, &c. But the only real requisite of them all in ordinary cases is a pair of dressing forceps, for removing bits of lint, &c., from the surface of wounds.

Cuts, wheresoever they may be, require but one mode of treatment in their first stage, and that is, to wash them well with cold water by letting it run or drop on them, which will generally arrest the bleeding. Then the edges must be drawn firmly together by strapping or "sutures" (stitches), and strapping over them a lint pad to stop the bleeding by pressure, kept in position by bandaging. A sponge is always useful, two or three about as large as a fist, if possible; and a bottle of carbolic lotion, made by dissolving one part of Calvert's glacial acid in forty parts of water, to be used instead of pump or tap water, both for washing the flesh wound and the hands of the person about to apply the dressing. These precautions are essential to successful treatment, and wounds thus treated will often heal at once without a sign of festering or suppuration; that is, by what is called "the first intention." As you must not stint carbolic lotion or carbolic water, if you prefer to call it so, it is well to have a bottle of Calvert's glacial acid in the house, so that your supply may be equal to all emergencies.

Wherever a wound may be, the first step is to wash it, and then draw the edges well together, to facilitate healing.

This is not always an easy job, for the cut will gape by the contraction of integument, and wire or thread sutures are often indispensable, especially for deep wounds across the direction of a limb—those that run in a lengthwise direction are more easily drawn together. Wounds on the head or body generally require a stitch or two, especially if they extend beyond an inch in length, otherwise all alike may be held together, and drawn together with strapping.

This will be a convenient place for describing a few styles of treating fresh cuts with "strapping"—that is, sticking-plaster, sometimes called diachylon plaster.

Plaster must be cut to suit the wound; small narrow strips are generally sufficient for the wounds you will have to treat at home, from a quarter to half an inch in width, and of various lengths, always being rather too long than too short.

You have a gaping wound, as D D under the strips of Fig. 2, and you want to draw its edges together and hold them there without stitching.

Cut two strips of plaster as in Fig. 1, only let the size be large enough to go well over both sides of the wound, lay them back to back, and cut a snick in them, as in Fig. 1 B, so that we shall have two slips as shown; the snick cut in one will run one way, whilst the snick in the other will run in the contrary direction.

Now, having carefully dried the surface on each side of the wound, and warmed the

plaster by holding it against a jug or tin of hot water, as shown in Fig. 8—the sticky part outside, of course, or it would all come off on the crockery—lay the end A, Fig. 2, so that the inside end of the snick comes a little way short of the edge of the wound, and ask a friend, or the patient, to keep it firm with a finger. Then take the other strips and do likewise, leaving the end marked C free and unstuck. Now, having made the ends at A quite firm—and the plaster must be well warmed to do it, and the skin must be dry—draw them past each other with the snicks inside—next to one another—holding ends between each forefinger and thumb, and pressing the edges of the wound together with one or other of the fingers until the strips will lock in the niches as shown in Fig. 3, when the end C may be stuck down also.

The utility of this method of strapping wounds is so useful that it should be practised by making an imitation cut with red ink on a friend's arm, and applying it to that—and let him have his turn with you—so that there may be no difficulty about it when the time comes that you may require its use.

Another very simple but secure style of strapping a wound is given in Fig. 4. The strips are laid on, one end being fixed first, and the other drawn over, as the edges are pressed together. The strips are laid in the order shown, as A, B, C. The letters being at the ends to be first fixed.

A cut at the end of the finger is of frequent occurrence, and the system of strapping adopted by amateurs generally are clumsy and useless as can be. It must be granted that the finger-tip does offer some little difficulty in the way of effectual strapping; but a little ingenuity will enable you to fix that, especially if you study the diagram (Fig. 5).

A is a finger with a transverse cut on the under surface, probably near the tip; B shows the lower edge of the nail; C is a long strip that will come nearly half-way down the finger, on both the surfaces. D, E, are two crosswise strips that are arranged like the straps of a soldier's knapsack, and F is a long binding strip that must be wound spirally down the finger round, to cover and hold securely the ends of the strips D, C, E.

A round piece of plaster cut like Fig. 6 into slits, and arranged one at a time like Fig. 7—overlapping—is very often useful for wounds of the head and temple, or may be used for strapping a breast, if shaped very much larger, with a hole in the centre for the nipple.

Although other simple and more elaborate systems of strapping may be employed now and again, those we have described are sufficient for almost all emergencies that you will be likely to dress yourselves.

(To be continued.)

## USEFUL DENTAL HINTS.

FURNISHED BY AN EMINENT SURGEON.

ONE of the most skilful dental surgeons gives these rules for the care of the teeth. "Use a soft brush and water the temperature of the mouth. Brush the teeth up and down in the morning, before going to bed, and after eating, whether it is three or six times a day. Use a good tooth powder twice a week, not oftener, except in cases of sickness, when acids from a disordered stomach are apt to have an unwholesome effect upon the dentine. Avoid all tooth pastes and dentifrices that foam in the mouth; the lather is a sure sign of soap, and soap injures the gums, without in any way cleansing the teeth. The very best powder is of precipitated chalk; it is absolutely harmless and will clean the enamel without affecting the gums. Orris root or a little wintergreen added gives a pleasant flavour, but in no way improves the chalk. At least a quart of tepid water should be used in rinsing the mouth. A teaspoonful of listerine in half a glass of water, used as a gargle after meals is excellent; it is good for sore or loose gums; it sweetens the mouth and is a valuable antiseptic. Coarse, hard brushes and soapy dentifrices cause the gums to recede, leaving the dentine exposed. Use a quill pick, if necessary, after eating, but a piece of waxed floss is better."

## A NEW STAFF OF LIFE.

[Condensed from the Article by LAWRENCE IRWELL in the current number of *The Humanitarian*.]

THERE is little doubt that of the many questions with which a nation is confronted that of its food supply is of greater importance than almost any other. In the United States all kinds of food are produced in the country in abundance, but in Great Britain this is not the case, the small size of the island rendering it, under existing conditions, impossible for the soil to yield anything like sufficient grain with which to feed the large number of inhabitants. American meat, wheat, fruit, and canned vegetables are all well known in the British and also in the other markets of the world, yet maize, by far the most prolific cereal of the new world, and the only food of many of the pioneers of this Continent, who built cities and established governments, has still to win favour in Britain and in the majority of the other European countries. A product called corn-flour has some sale in England, but it is only a starch made from maize, and although wholesome and agreeable to the taste, it is not specially nutritious, neither the muscle-forming nor the bone-creating properties of the grain being present.

The origin of this remarkable grain, which has so signally benefitted the inhabitants of the new world is, like that of wheat, very obscure. It is mentioned by Theophrastus, who was the successor of Aristotle in the Peripatetic school, and who wrote on the history of plants. The date of his death is a matter of inference; he was probably born about 368 B.C., and died in 288 B.C. Theophrastus writes of maize as being of the tribe Phalarides of the order Gramineæ (grasses). Alphonse de Candolle, the Swiss botanist, in his "Geographie Botanique Raisonnée," which appeared in 1855, says, "Maize is of American origin, and was not introduced into the old world until after the discovery of the new."

Upon the American continent, maize, commonly called corn, is now cultivated from latitude 54 degs. N. to 40 degs. S., and in the Eastern hemisphere from the Azores to South-eastern Europe some being grown in Asia Minor, Egypt, India, and China. Frost destroys all varieties of this plant, and it does not flourish well if the nights are cold, consequently it is the first crop to disappear as one ascends into the mountain regions. Little is grown west of the great plains of North America, the grain flourishing best in a deep, rich, and dry soil, such as is found in the fertile prairies of the Mississippi basin.

More than three hundred varieties of maize are known, and they differ more among themselves than those of any other cereal. Some reach maturity in two months; others require as long as seven. Some are as many feet in height as others are inches; some have kernels eleven times larger than others. They also vary in shade and size of ears and colour of the grains, which may be white, yellow, purple, black, or striped.

The early colonists of the United States learned the uses and methods of cultivating maize from the Indians, large crops being raised on the James River, Virginia, as early as 1608, and it has continued to be one of the most important American products, the actual quantity grown being now at least eight hundred million bushels per annum. The Indians claimed to have received the plant direct from the Creator. Schoolcraft in his "Myth of Hiawatha," gives their legend in the following words:—

"A young man went out into the woods to fast, at a period of life when youth is exchanged for manhood. He built a lodge of boughs in a secluded place, and painted his face a sombre hue. By day he amused himself in walking about, looking at the various shrubs and wild plants, and at night lay down in his bower, through which, being open, he could look up into the sky. He sought a gift from the Master of Life, and he hoped it would be something to benefit his race. On the third day he became too weak to leave the lodge, and as he lay gazing upward he saw a spirit come down, in the shape of a beautiful young man, dressed in green, and having green plumes on his head, who told him

to arise and wrestle with him, as this was the only way in which he could obtain his wishes. He did so, and found his strength renewed by the effort.

"The visit and trial of wrestling were repeated for four days, the youth feeling at each trial that, although his bodily strength declined, a moral and supernatural energy was imparted, which promised him the final victory. On the third day his celestial visitor spoke to him. 'To-morrow,' said he, 'will be the seventh day of your fast, and the last time I shall wrestle with you. You will triumph over me and gain your wishes. As soon as you have thrown me down, strip off my clothes, and bury me on the spot, in soft, fresh earth. When you have done this, leave me, but come occasionally to visit the place, to keep the weeds from growing. Once or twice cover me with fresh earth.' He then departed, but returned the next day, and, as he predicted, was thrown down. The young man punctually obeyed his instructions in every particular, and soon had the pleasure of seeing the green plumes of his sky visitor shooting up through the ground. He carefully weeded the earth, and kept it fresh and soft, and in due time was gratified by beholding the matured plant, bending with its golden fruit, and gracefully waving its green leaves and yellow tassels in the wind. He then invited his parents to the spot to behold the new plant. 'It is Mondamin,' replied his father; 'It is the Spirit's grain.' They immediately prepared a feast, and invited their friends to partake of it: and thus originated Indian corn."

In extent and variety of forms and uses, maize surpasses all other plants. A well-developed stalk of maize is a really beautiful object. The long, graceful, dark-green leaves are surmounted by straw-coloured blossoms, and as they wave in the breeze, a stately, sub-tropical aspect is presented to the eye. In some parts of Europe this valuable cereal is prized as an ornamental plant, especially a distinct variety sent from Japan by Mr. Thomas Hogg some twenty years ago. Every part of this grain is utilised, even the husks, which are used by paper makers as material for pulp, by upholsterers as filling for mattresses, by the orange growers in the south of Europe for packing fruit, and by the South Americans for coarse mats. The grain itself is used for feeding cattle and hogs, for making glucose, a business which has of recent years assumed enormous proportions, and in the manufacture of whisky, lager beer, and starch. Oil has been extracted from the grains of maize in considerable quantities, but as the process is costly, this industry is not likely to become very extensive. In the treeless regions of the west, maize has been used as fuel, and has been found to be a good substitute for wood or coal.

Some ten years ago the London General Omnibus Company, as an experiment, tried the process of feeding their horses entirely upon maize. This attempted novelty in horse diet turned out a failure, the horses becoming fat, and showing much humour. Had hay been used with the maize, there is little doubt that the experiment would have proved a success.

The special object of this paper is to demonstrate its availability as human food in Great Britain and other parts of Europe, and also to draw attention to the many beneficial qualities which it possesses.

The monotony of the diet of the poorer classes in England being well-known to all who have devoted any attention to the way in which "the submerged tenth" is compelled by circumstances to live, requires no comment here. Tea and bread might well be occasionally replaced by mush (maize meal) and milk. Maize makes a concentrated food stuff, both palatable and nourishing when properly prepared, and is especially valuable where hard labour is required. The English working men have reason to know that no harder class than the American husbandman exists, and when they fully realise this fact, they will cease to treat with disdain a food which is a staple article among the American agricultural population.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 11d. and 2s. 9d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, E. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

In the European countries which maintain gigantic military establishments, the question of feeding the troops in such a manner as to ensure the highest possible state of efficiency, at the lowest possible cost to the taxpayer, is one which deserves the attention of statesmen. A diet is required which must be at once concentrated, nourishing, and sufficiently varied to meet the demands of modern civilisation. The one grain which fulfils all these demands is maize; and its adoption as a portion of the army ration in European countries would be most desirable from every point of view. To the governments concerned, the advantage would be that the grain would be cheaper than any other equally suitable article of food. Further, maize being better able to withstand the changes of the climate, especially drought, than other cereals, an abundant quantity, not subject to such fluctuations of supply as wheat, is always obtainable. The white bread so much used at the present day, consists chiefly of starch, and the partial substitution of maize would mean greater physical efficiency among the whole military force; to the individual men constituting the service, it would give an increased variety of food, and consequently additional comfort. Nor is this all. No argument in favour of a new kind of food can outweigh that of its healthfulness, and maize, both from its inherent properties and its history as an article of diet, can certainly claim this desideratum. Constipation is almost unknown to those who are daily consumers of this grain, and dyspepsia—now very prevalent in the United States—was scarcely ever heard of fifty years ago, when maize was the chief food of the people. The special power of aiding digestion possessed by maize appears to be due to the manner in which it stimulates the action of the alimentary canal. The gluten contained in the grains being inseparable in water, little leaven is required to lighten it, and however close the particles may appear to be, they are not agglutinated, and are easily separated during mastication and digestion.

Maize meal is much consumed in the form of bread and cakes, conspicuous among which is brown bread, in which rye-meal is mixed with corn-meal, in the proportion of about one-third. Several varieties are known as "popcorn," of which there are two kinds, one white and the other yellow, some having grains pointed at the end, others being of the ordinary shape. When gradually exposed to heat, the oil contained in the grain becomes converted into gas, which eventually ruptures the grain, causing a curious inversion of its contents. The corn thus "popped" is many times larger than the ordinary grain, and perfectly white. As a species of sweetmeat, popcorn is much prized by children, and the preparation of it is one of the small industries of the United States. "Hasty pudding" is a stir-about of Indian meal and water, which, when eaten with milk, is a nutritious and an inexpensive form of food.

There are over a hundred methods of cooking this cereal, all of which have met with the approval of connoisseurs, and although the use of maize as an article of human diet might at first be regarded as a Yankee innovation, yet its delicacy and cheapness would undoubtedly popularise it before many years had elapsed.

**THE CREATIVE GIFT.**—The writer who possesses the creative gift owns something of which he is not always master—something that at times strangely wills and works for itself. He may lay down rules and devise principles, and to rules and principles it will perhaps for years lie in subjection; and then, haply without any warning of revolt, there comes a time when it will no longer consent to "harrow the valleys or be bound with a band in the furrow"—when it "laughs at the multitude of the city, and regards not the crying of the driver"—when, refusing absolutely to make ropes out of sea-sand any longer, it sets to work on statue-hewing, and you have a Pluto or a Jove, a Tisiphone or a Psyche, a Mermaid or a Madonna, as fate or inspiration direct. Be the work grim or glorious, dread or divine, you have little choice left but quiescent adoption.—*Charlotte Brontë.*

BRIDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

## THE COST OF A MEDICAL EDUCATION.

**A**MONG the questions now agitating the parental mind in scores of cases in regard to the education of the rising generation, few are more pertinent than the inquiry, What will it cost? Can I afford it? A correct answer is of especial importance when it is a question of entry into the medical profession. If a medical education turns out more expensive than had been anticipated, if it cannot be afforded and fails to be carried to through to the end, not only are the money and the time spent upon it thrown away—absolutely wasted from a money-earning point of view—but the student finds himself, at an age which makes an entry into business difficult, stranded without employment or profession, and his little capital gone. It is, then, of the greatest moment that before embarking in the study of medicine an accurate estimate of its probable cost should be formed, otherwise the student runs the risk, of which every year sees sad examples, of dropping out of his course in mid-career, his youth wasted, his future spoilt.

The expenses of the curriculum may be divided into two classes—one of which consists of fixed charges which can be accurately calculated beforehand, the other of things which, being personal to the individual, are liable to a certain amount of variation in individual cases.

In the first class come all the expenses directly connected with schools and examinations, in the second those connected with maintenance.

The fees for the various examinations differ, as also do the composition fees for hospital and school work at different places, but they are all published, and can be calculated to a penny.

Then there are certain other expenses, the exact amount of which cannot be found from published tables, and which also vary at different schools—namely, subscriptions to library, cost of "parts" for dissection, of chemical, biological, and pathological apparatus and materials; of books, bones, &c.; and the subscription to cricket, football, or rowing clubs, which, although not in the estimate, may be practically obligatory. As regards all these points, when the school and the diploma are provisionally decided on, a little correspondence asking for definite answers to definite questions, ought to enable any man to make an estimate within a few pounds of the sum required. The great question to which no precise answer can be given is as to the cost of maintenance. Various attempts have been made to estimate the cost of living appropriate to the medical student, many of which are utterly futile owing to the fact that there is no standard of comfort acceptable to all, very little standard of dress, and absolutely none as regards amusements. The range of possibilities in this matter becomes obvious enough when we consider, on the one hand, at what wages an artisan can live, and, on the other, how easily £5 a week slips through the fingers of one not inured to petty thrift and to the care of pence. It is here that the nicely brought up youth finds himself at a disadvantage with those who, from early habits, do not feel the hardship of surroundings which to him would be constant misery; for there is no denying that it is possible, to one accustomed to the style of life, to pass through the curriculum on an artisan's wages added to the necessary fees. To one not trained to such economy the attempt would be folly, but many a black-coated clerk lives on £70 or £80 a year, and certainly scores of curates do not receive more than £100 to £130, and it appears to us that this last may fairly give an idea of what a gentleman willing to live carefully can keep himself upon. Here, again, locality has much to do with expense of living. It may possibly be the case that lodgings, in certain parts of Manchester, or Dublin, or Edinburgh, do not cost much less, if any less, than they do in London, but from the smaller size of these towns a greater range is available within a moderate distance, a walk which in London would make no appreciable difference in surroundings bringing one into those more open regions where cheaper lodgings are most likely to be found.

It may, we think, be taken broadly that all

classes of expense tend to vary together, that cheaper rent often accompanies cheaper food, and even cheaper style of clothing, and that, at the very places where the necessary expenses are least there the social expenses into which people are drawn by custom and imitation are also kept at a low level, partly, probably, because richer men tend to flock to more expensive schools where it is difficult to prevent them from setting the fashion in many ways.

It may be said, and with some truth, that at a large metropolitan school it is easier for a student to become lost in a crowd when he leaves the college gates, and to live as he likes or as necessity may force him; but it must be at once insisted on that by such a mole-like existence, in which the student, however much he may sit with others in the class, hides himself from them in his private life, a youth loses a great part of those wider educational advantages which a more intimate association with his fellows ought to give.

An active companionable student life, full of intimacies, rivalries, and competitions, both in regard to work and play, not only brings out the best powers of a man's mind, but is a thing to look back upon with pleasure so long as life shall last. It is no small loss that a period so full of expansive possibilities should be turned into a time of penurious counting of petty cash, and we feel sure that it is better, as an educational proceeding, to send a youth, whose means are small, to a school so suited to his pocket that he can join in what is going on evenhanded with the rest, than to place him where he will have to study economy and even parsimony at the expense of sociability. We doubt, for example, the educational advantage of trying to live at Cambridge for the less than £150 a year. What is gained in knowledge is lost in bitterness of spirit.

Nor must it be forgotten that the life of a medical student is a trying one, and that for the maintenance of health provision must be made for a considerable amount of outdoor exercise. Boating, cricket, tennis, football—things for which the solitary walk is no substitute—all mean clubs and subscriptions, and, although this is a side of student life which is often overdone, it is absolutely essential that some provision be made for it. Two years spent in laboratories and dissecting rooms form but a poor preliminary, from a health point of view, to the long study of disease which then has to be undertaken, in wards and out-patient rooms, mixing daily with the sick of every kind. The athletic side of education is really more necessary for the medical than for any other class of student. — *British Medical Journal*.

## PRESERVATION OF HEALTH.

### FIFTEEN RULES FOR PRESERVING HEALTH.

**P**URE atmospheric air is composed of nitrogen, oxygen, and a very small portion carbonic acid gas. Air once breathed has lost the chief part of its oxygen, and requires a proportionate increase of carbonic acid gas. Therefore, health requires that we breathe the same air only once.

The solid parts of our bodies are continually wasting, and required to be repaired by fresh substances; therefore, food which is to repair the loss should be taken with regard to the exercise and waste of the body.

The third part of our bodies also waste constantly. There is but one fluid in animals, which is water, therefore, water is necessary.

The fluid of our bodies is to the solid in proportion as nine to one; therefore, a like proportion should prevail in the amount of food taken.

Light exercises an important influence upon the growth of animals and plants; therefore, our dwellings should freely admit the solar rays, and be well ventilated.

Decomposing and animal and vegetable substances yield various noxious gases, which enter the lungs, and corrupt the blood; therefore, all impurities should be kept away from our abodes, and every precaution used to secure a pure atmosphere.

Warmth is essential to all the bodily

functions; therefore, an equal temperature should be maintained.

Exercise warms, invigorates, and purifies the body; clothing preserves the warmth; therefore, an equal temperature should be maintained.

Fire consumes the oxygen of the air, and produces noxious gases, therefore, the air is less pure in the presence of candles and gas, or coal fires than otherwise, and the deterioration should be repaired by increased ventilation.

The skin is a highly organised membrane, full of minute pores and cells, blood vessels, and nerves; it imbibes moistures and throws it off according to the state of the atmosphere and the temperature of the body; it also breathes, as do the lungs (though less actively.) All the internal organs sympathise with the skin, therefore, it should be repeatedly cleansed by plentiful ablutions and the warm bath, the latter is most beneficial.

Late hours and anxious pursuits exhaust the nervous system, produce disease, and very often premature death, and should always be avoided, both by the healthy and the delicate.

Mental and bodily exercise are equally essential to the general health and happiness of all. Recreation and study should succeed each other.

Man will live most healthily upon simple solids and fluids, of which a sufficient but temperate quantity should be taken. Excess in any shape whatever should always be avoided.

Sudden alterations of heat and cold are dangerous, more especially to the young and aged. Clothing in sufficient quantity and quality should be adapted to the change of the seasons. Drinking cold water when heated, or hot tea and soups when cold, are productive of many evils.

Moderation in all things are essential to a healthy state of body and mind. Were these rules regarded all would live happier and longer.

## BIRTHS.

**W**HEN a birth takes place, personal information of it must be given to the Registrar, and the register signed in his presence by one of the following persons:—

1. The father or mother of the child. If they fail, 2. The occupier of the house in which the birth happened. 3. A person present at the birth; or, 4. The person having charge of the child. The duty of attending to the registration thereof rests firstly on the parents. One of them, must, within forty-two days of the birth, give to the Registrar by word of mouth the information needed to enable him to register, and must sign the register in his presence. If they fail to do this without reasonable cause they will become liable to a penalty of forty shillings. In case of their failure, one of the other persons above-named must give personal information, and sign the register within the same period. If at the end of forty-two days no one has given information and signed the register, the Registrar may write to any one of the above-mentioned persons requiring him or her to come to him for that purpose, at a stated time and place. Any person who fails to comply with this requisition will become liable to a penalty of forty shillings. Not only will liability to a penalty be avoided, but the registration of a birth will be free of charge when it takes place within forty-two days, unless either of the persons above-named sends to the Registrar a written request to come and register at his or her residence, or at the house where the child was born, when the Registrar on so attending to register may claim a fee of one shilling. After three months a birth cannot be registered, except in the presence of the superintendent Registrar, and on payment of fees to him and the Registrar. After twelve months a birth can be registered only on the Registrar-General's express authority, and on payment of further fees.

TO TOBACCONISTS (commencing).—*Illustr. Guide*, 259 pages, "Post Free." How to Commence, £20 to £1000. Tobacconist's Outfitting Co., 186, Euston Rd., London. Manager, Hy. Myers. Est. 1866. Smoke "Pick-Me-Up Cigarettes."

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**VALUE OF GOOD COOKING.**—Thousands have yet to learn that the kitchen is the most important end of the household. If that goes wrong, the whole establishment is wrong. It decides the health of the household, and health settles almost everything. Heavy bread, too great frequency of plum pudding, mingling of lemonade and custards, unmanageable beef, have decided the fate of sermons, legislative bills, and even the destiny of empires. The kitchen knife has often cut off the brightest prospects. The kitchen gridiron has often consumed a commercial enterprise. The kitchen kettle has kept many a good man in hot water. It will never be fully known how much the history of the world was affected by good or bad cookery.

**A SCOTCH BROSE** is a time-honoured dish. It calls for three cupsful of the liquor in which a leg of mutton or a piece of beef has been boiled, or the same amount of stock, a cupful of oatmeal, and an even teaspoonful of salt in case the stock has not been salted. Let the oatmeal cook steadily in an earthen pipkin in the broth for one hour, and serve. Oatmeal, when served in this way for breakfast, may be cooked the night before, and steamed in the morning. Almost any grain, such as rice, hominy, or barley, is excellent cooked in stock in this manner especially when it is served with a dish of meat, and not as a breakfast porridge, with milk.

**BEEFSTEAK STEW.**—Put one quart of seasoned tomatoes with two pounds of round steak cut up, three cloves, one tablespoonful braided flour in a pan, and simmer till tender, but add no water. Strain liquor for sauce.

**CREAMED BEEF.**—Scrape perfectly lean beef to pulp; mince, put in a pan with salt, pepper, one tablespoonful of water, two tablespoonfuls of rich cream, butter the size of an egg. Cook two minutes, stirring constantly. Add one tablespoonful of crackerdust, one teaspoonful of made mustard.

**LEG OF PORK.**—Remove skin, lay in jar, pour over one pint of white wine, two tablespoonfuls of oil, sage, pepper, pinch of nutmeg. Leave two days in winter, one in summer, turning often. Roast, basting with jar liquor, which strain and thicken for sauce.

**HAM A LA Russe.**—Soak three hours. Trim and cover with paste, half an inch thick, of flour and water. Bake, remove paste, skin, cover fat with paste of half a cupful of brown sugar, one tablespoonful of flour, and moisten with port. Brown in oven.

**PARSNIP WINE.**—Slice twelve pounds of parsnips, and boil in four gallons of water till soft. Squeeze dry, and strain the liquid through a fine sieve. Add to each gallon three pounds of granulated sugar. Boil for three-quarters of an hour. When nearly cold add a tablespoonful of yeast to each gallon. Let stand in tub or jar for ten days, stirring every day from the bottom. Put in jugs and keep full till fermentation ceases, then bottle.

**A FIRMER** and more delicate grain is secured in cake by stirring the dough only in one direction.

**SPICE GINGERBREAD.**—Take three pounds of flour, one pound of butter, one pound of sugar, four ounces of lemon-peel, one ounce of ginger, one ounce of allspice, and one and three-quarter pounds of syrup. Mode—cream up the butter and sugar together, as in the foregoing recipe, then add the ginger, allspice, peel, syrup, and lastly, the flour. Turn the mixture out upon your board, which you have previously floured to keep the dough from sticking, then weigh off in pieces of fourteen ounces each, mould up, and put in hoops six inches in diameter. Dock with a docker, wash over with milk, and bake in a slow oven. When baked, gloss over with a little gum dissolved, or a little melted jelly, if you have any at hand, will do very well. This quantity given will make eight cakes. They keep for a good length of time, and eat better when a few days old—in fact almost all gingerbreads do, in our opinion.

**BEEF TEA.**—Cut up two pounds of lean, juicy surlow steak into pieces about two inches square. Grease a saucepan lightly with butter, which place over a very hot fire of red coals, and as soon as the pan is hot toss the beef in. Turn the pieces over and over with a fork, letting them brown slightly on each side; there will be scarcely a drop of juice in the pan while this is being done, so quickly does the heat accomplish its work. As soon as the pieces are heated through, take them out one by one, and rapidly squeeze them through a wooden lemon squeezer (which must be standing in boiling water) into a bowl which has been well-heated. Put a small pinch of salt into the juice, and cover the bowl well over to preserve the heat. This manner of preparing beef tea is most valuable when it is required at once—taking only a few minutes to make and the entire strength of the meat being extracted.

**ORANGE TAPIOCA.**—Wash three tablespoonfuls of tapioca, cover with cold water, and soak over night. In the morning, heat one pint of milk in a double boiler, add the tapioca, a pinch of salt, and boil twenty minutes. To the well-beaten yolk of two eggs add half a teaspoonful of granulated sugar and one teaspoonful of cornstarch dissolved in a little cold milk, and boil for five minutes. Then pour into a pudding dish, make a meringue of the whites of eggs, two tablespoonfuls of powdered sugar, flavour with orange extract, and in a moderate oven brown slightly. Pare, slice thinly, and remove the seeds of six or eight large, sweet oranges; lay in the bottom of a glass dish, and sift powdered sugar over and between each layer. When the pudding is cold, run a wet knife around to loosen the edge, lay it over the fruit and serve.

## HINTS FOR THE HOUSEHOLD.

**DON'T SLEEP IN LINEN.**—The world, or this part of it, at least, is full of housekeepers who think that there is no material for sheets and pillow cases comparable to linen. They don't always have it, to be sure, because it is expensive, but they always covet it and finger the shining breadths lovingly and wonder if the time will ever come when all these things shall be added unto them. But the truth about linen is that it isn't the ideal dressing for beds at all. It is cold and slippery, and insures a sensitive person the dream of sleeping on an iceberg, which does well enough for an occasional experience, like sea-sickness, but which palls on too frequent repetition. Besides that, it wrinkles and tumbles in spite of its heavier body, much more than cotton does, giving a bed after one night's use a most slovenly and uninviting appearance. Nobody recommends linen for body wear. Its firm texture and hard surface make it wholly non-absorbent; it allows the body to become chilled by refusing the perspiration, and so has been known to bring on serious illness. For outside wear in summer, linen may be tolerated as clothing, but nowhere else. Where, however, it is at its usefulest and best is in household uses. For table service, for the toilet, and for minor ornamental details, it is simply invaluable—its smoothness of texture, its brilliancy, which landering even increases, its exquisite freshness makes it the one fabric fit to drape the dining table, and to use in the toilet, while its suitability for needlework decoration makes it admirable for all kinds of fancy work. And here it is rightfully used, but to wear next the skin and sleep in—No.

**TO HARDEN GLASS.**—Put dishes, tumblers and other glass articles into a kettle; cover them entirely with cold water, and put the kettle where it will soon boil. When it has boiled a few minutes, set it aside, covered close. When the water is cold, take out the glass. This process will harden the articles so that they will not be so easily broken.

**KEATING'S POWDER.**—Kills bugs, fleas, moths, beetles, and all insects (perfectly unvaried). Harmless to everything but insects. Sold in Tins, 6d. and 1s.  
**WORMS IN CHILDREN.**—Are easily, surely, and with perfect safety got rid of by using KEATING'S WORM TABLETS. Tin 1s. 1½d. Free by post 13 stamps.

**AIR YOUR CLOTHING.**—Everyday garments, particularly those that are not laundered, should be disinfected. Brushing is not sufficient, as it does not remove the unpleasant odours that come from long usage. Some women sprinkle their waists and dresses with scent and use sachet powders to perfume their bonnets and wraps. All this would be admirable were it availing. Scent needs to be overpowering to conceal the unfragrant emanations from an old garment. Then the bouquet is fulsome and vulgar.

**STOPPING A LEAK.**—"I do not know if one way of stopping a leak in a saucepan is generally known," says a young housekeeper, "but it struck me as original, and it is certainly very simple and efficacious. I went into the kitchen the other day and saw that my cook, who is French, had something simmering on the fire. As she was pouring it out, I saw a little white rag at the bottom of the saucepan. 'What is that, Pauline?' I said. 'Oh! did madame never see that way of mending a hole?' she explained. 'But see, it is very simple,' and she pulled out the little piece of linen and showed me quite a large hole in the agate pan. 'I put the corner of a bit of linen through, so,' she went on, 'and then I pull it until the fullness is jammed very tight; then with a knife I cut it off on each side and it holds perfectly.' 'But I should think it would burn,' I said. 'It never does,' said Pauline, 'but I don't know why—perhaps because it remains wet—viola!'

**CARPET-SWEEPERS** are not so much used as they deserve to be, for they rank among the most useful domestic appliances of the nineteenth century. By this aid a carpet can be kept in good condition for years, and the disagreeable process of sweeping robbed of half its terrors. This household necessity is an American invention, but several English firms now manufacture and supply them.

**NOT WITH SILK.**—It is a very common habit, but a great mistake, to mend gloves with silk, as the silk will cut the kid more than fine cotton thread, thus showing the mend more plainly. For the same reason it will not hold the edges of the kid so firmly, but instead it will cut through in time. You will notice that all kid-gloves are sewed with cotton-thread. The manufacturers understand the difference in the material and use the most satisfactory. Thread of all shades, especially put up in twist for glove mending, can be bought for a trifle. If a glove is badly torn or ripped, try to match its colour with a bit of silk. Lay this under the torn part and baste it down in small stitches that do not show on the right side. Then draw the rip up as carefully as you can, taking up very little of the kid as you do so.

**BEWARE OF THE CHEAP THIMBLE.**—Girls who sew for a living often suffer from soreness in what is sometimes called the thimble finger, and serious inflammation and swelling is often the result. No sewing girl or woman should let herself be tempted by the low price of thimbles, which are composed of lead or something equally injurious. Silver or plated thimbles are very much the best and safest, and when these are too expensive, a good substitute can be found in a highly burnished steel thimble. For practical everyday use this latter kind is the most convenient, but pewter or lead should never be used, especially by people whose flesh is slow to heal after a scratch or cut.

**AN** instance of great bravery on the part of a blind boy was made public at an inquest at Waterford last week. The lad, who is named Stewart, was one of a bathing party, and on another lad named Myers being carried away by the current, he swam after him guided by his cries, and brought him safely to land. There were then cries that a boy named Higgins was drowning, when Stewart, though greatly exhausted by his exertions, again entered the water and made an unsuccessful effort to save him. The jury praised the lad's bravery, and recommended the case to the notice of the Royal Humane Society.

# THE MOTHER'S PAGE.

## IMPORTANCE OF EARLY IMPRESSIONS.

FEW parents recognise the influence of mental surroundings upon infant children, but it must be borne in mind that just as an adult has many ideas and thoughts which he cannot express or put into any communicable form, so the little child, long before it can speak a word or form a sentence, has many more concepts than he has the power to express. All the months previous to his use of language he is receiving of indelible impressions, so that this period of helpless infancy is really one formation in a very literal sense. Whatever is in the mental and moral atmosphere about him, he is absorbing, and by and by when he has acquired the means of expressing himself he will echo his surroundings. Because a little child cannot comprehend the words he hears is no proof that he has not received well defined impressions which are the basis of character. Later on, perhaps, the father and mother wonder how their child acquired certain tendencies and habits, which very likely were absorbed in the first year of its existence.

## COURTEOUS WAYS.

"A GOOD manner," says Bulwer, "is the best thing in the world either to get a good or to supply the want of it." Politicians are well aware of this, and, therefore, are careful to put a hinge in the neck, and keep it well oiled. In many private callings coarse, awkward, or offensive manners often neutralise the finest intellectual gifts. It seems hard that men should be prepossessed or prejudiced regarding one another by what is merely superficial; but the simple fact is, they are. There are thousands of good, even excellent persons in the world with a certain hardness of character whose manners are disagreeable. There are blunt and boorish, shy and reserved men, with whom intercourse is exceedingly unpleasant. It is not that they are malignant, but they lack a delicate perception of the little trifling things by which pain or pleasure is caused. Again, there are rude, cynical, restless people—the contradicter and railers at public and private tables, that, as Emerson says, are like terriers, who conceive it the duty of a dog of honour to growl at any passer-by, and do the honours of the house by barking him out of sight. On the other hand, there are men of a winning, sympathetic, golden temper, with whom a half-hour's talk is as invigorating as a bath of sunshine. Is there any doubt to which of these classes belong the men who get on in life?

"Civility," says Lady Montagu, "costs nothing and brings everything." The shrewd Mme. de Tencin gave as a rule to Mme. de Geoffrin, who was educated under her: "Never rebuff any man, for though nine persons out of ten should not give themselves a farthing's worth of trouble for you, the tenth may become a useful friend." Many a fortune has been won by little attentions that were not tinged with the hope of after reward, but were sincere and kindly ones, springing from a good heart and good breeding combined. It is related of the wife of Dr. Dodd, that once, when attending an auction, she bid for a cabinet, and was at once outbidden by a lady present, upon which Mrs. Dodd immediately courteseyed and retired from the contest. The lady, who had set her heart upon the article, was so pleased by this, that she expressed a desire for a better acquaintance with Mrs. Dodd, and shortly afterward presented her with a lottery-ticket which drew a prize of one thousand pounds. A celebrated English politician is said to have won an influential lady's support in an important election, by listening patiently as she explained to him in detail fourteen ways of making a certain kind of cake. The glaring vices of Charles James Fox were overlooked by those who felt the fascination of his manner. His courtesy and affability preserved him from personal dislike, even when he had gambled away his last dollar, and politically was the most unpopular man in England. When Pitt, his chief opponent, was asked in Paris in 1783, by some French statesmen how a man ruined by the dice-box and the turf, could have weight in England, he replied: "You have never been under the wand of the magician."

Can this charm of manner, true courtesy, be acquired; and if it can, in what way? No doubt it is often a natural gift, but it is often, too, the result of art and culture. Though when it is in perfection we cannot analyse it and detect its hidden mystery any more than we can analyse a delicate perfume, yet it is in substance what Lord Chatham, in his letters to his nephew at Cambridge, calls "benevolence in little things." This benevolence is not to be acquired by studying rules of etiquette, though these are not to be despised. Of course a well-bred man will be truthful, calm, quiet, dignified, and self-possessed; he will not be unduly familiar or obtrusive; will not be supercilious, boastful, or vain of his gifts or accomplishments; will be respectful to his inferiors, and tender toward the weak; will be

self-denying without effort; will listen attentively when spoken to, and not interrupt the speaker; will tell few stories in general society, and when he tells one, will make it, and avoid needless details, &c. But these are merely the outward manifestations of courtesy, which has its source within—in the heart. True courtesy springs from goodness of heart. To attain it you must be filled with a kind and loving spirit. You must have what Sir Philip Sidney calls "high thoughts seated in a heart of courtesy." If these are wanting, all the forms of politeness are but empty husks, a cheat, and a sham. But if you have a sincere desire to please, this is more than half the battle. Frequent good society and observation and attention will achieve the rest. "Live among wolves," says a Spanish proverb, "and you will soon begin to howl." Live among well-bred people, and insensibly you will catch and reproduce the air, the address, and the turn of those with whom you associate.—William Mathews, in *Harper's Young People*.

ALWAYS teach a nurse that a child cannot swallow as long as the spoon is between the teeth; that it is advisable to depress the tongue a brief moment, and withdraw the spoon at once, and that now and then a momentary compression of the nose is a good adjuvant.

## THE SLEEP OF CHILDHOOD.

KIND Nature, that art to all a beautiful mother; that visitest the poor man's hut with auroral radiance, and for thy nursing hast provided a soft swathing of love and infinite hope wherein he wakes and slumbers, and danced around by sweetest dreams! If the paternal cottage still shuts us in, its roof still screens us; with a father we have as yet a prophet, priest, and king, and an obedience that makes us free. The young spirit has awaked out of eternity, and knows not what we mean by time: as yet time is no fast-hurrying stream but a sportful sunlight ocean; years to the child are as ages. Ah! the secret of vicissitude of that slower or quicker decay, and ceaseless down-rushing of the universal world-fabric from the granite mountain to the man or day-moth, is yet unknown; and in a motionless universe we taste what afterwards in this quick whirling universe is for ever denied us, the balm of rest.

## AFTER THE BABY HAS GONE.

You have folded the dainty garments smooth,  
And stroked the down with a trembling hand,  
Then laid them safe in the bureau drawer,  
And only mothers can understand  
What tears were laid with the precious things,  
What memories hallow the quiet place;  
How even the dresses seem to hold  
Some dream of the darling's vanished grace.

There are socks of zephyr, and tiny shoes,  
And a strand of beautiful hair, half curled,  
And caps of lace that once daintily framed  
A face—the sweetest in all the world.  
The pretty embroidered christening robe,  
The toy last held in the dimpled hands—  
How dear are these to a mother's heart  
No one but a mother can understand.

You will steal aside in the busy morn  
To handle them tenderly, one by one;  
You will lay them out on your empty lap  
When the pleasureless work of the day is done;  
We know not the fashion of robes of light;  
Undreamed are the joys of that happy land;  
But how you cling to those little clothes  
A million mothers can understand.

—Lilian Grey.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 6d., and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 33 or 132 stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

## UNQUESTIONING OBEDIENCE.

How many mothers, for want of thought, are helping to cultivate in their children that stubbornness and selfwill which is fatal to all future happiness and usefulness.

It is a serious mistake for the mother who denies her children certain privileges, to give in detail the reason for decision. After the simplest statement of the case she should not allow herself to be teased by repeated questioning lest she finally yield to a persistency that makes everybody uncomfortable. If her verdict is well considered before hand, and love accompanies firmness, her children soon learn to place implicit confidence in her word, and to know that there is no appeal from it. In this way obedience and reverence are both developed, which in later life makes the transition from dependence upon personality to the impersonal law easy and natural, and without the suffering to which the ignorant or lawless are liable.

In other words: children who acquire the habit of unquestioning obedience to superiors more readily conform in adult life to that higher Law which governs happiness and well being. If the lesson of obedience has not been learned in childhood, the struggle in later years will be long and bitter, and often unsatisfactory in its results.

The wise parent seeks to show his child that it is not personal authority to which he is subjected, for nothing more surely separates parents and children than the exercise of mere brute force, but the child is made to understand that it is solely because it is *right* that he is required to follow a certain course, and that his father and mother stand to him as the interpreters of the Law to which they also are obedient.

## RINGWORM OF THE SCALP.

RINGWORM is always acquired either from a child wearing the hat of another child, or coming in contact with some person having ringworm, or, not infrequently from handling domestic pets, such as the cat or the dog. The first symptom that usually attracts the parent's attention to the disease is that the child scratches the head. Inspection will show that there are one, two, or perhaps more patches on the scalp that are scaly, and that the hair over them is broken off so that at first they look as if bald. The size of the patches varies from that of a marrowfat pea up to a five-shilling piece. Examination of the body may show that the child has there also one or more ring-shaped patches with red raised borders and scaly centres. For a child to acquire ringworm of the scalp is an unfortunate accident, because it takes six or more months to cure a case by the best of treatment, if once it is well established. So go to your physician as soon as you find a ringworm of the scalp. The disease as it occurs upon the body is a trivial matter.

STEEDMAN'S Soothing Powders for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Walsworth, Surrey. Sold everywhere. Please observe the *EE* in Steedman.

## THOSE ABOUT TO EMIGRATE.

IN distant lands, whither the necessities of colonisation, still more than the chances of war, take our gallant soldiers, everyone knows that the influences of climate are far more deadly than the bullets of the enemy. It is an established fact that Europeans do not easily accommodate themselves to the temperature of these countries, and, being less inured than the natives, they succumb in large numbers to the heat. But if special affection exist in these places, cannot they be opposed by some hygienic preventive?

Precisely at the hour when French sailors are hoisting the National flag in the Bay of Mekong, it happens that there is being organised at the Paris Museum, thanks to the initiative of the learned director of that establishment, Principal Milne-Edwards, a course of instruction, the utility of which no one will dream of disputing. This instruction, intended for explorers, includes a lecture on "Hygiene for Travellers," and it is from that lecture, delivered by M. Gréhaut that we borrow most of the following particulars.

Any journey that a traveller may choose, and the countries that he proposes to cross, may be included in two zones, the glacial and the tropical. We shall not dwell at any length on the polar regions or those of high altitudes; besides the fact that expeditions into these countries are exceptional, the climate is generally most healthy. There is only one disease at all vigorous there, that is scurvy; and that in our day no longer works the ravages that were formerly met with.

To protect his company from this disease, Nordenskiöld, in the touching narrative of his memorable journey, reports that he served with every meal preserves of mulberry steeped in rum. As this berry operates only by means of the tannin it contains, and may sometimes be inefficient; it will be found good to substitute for it, the simple rinsing of the mucous membrane with lemon juice, or, in the more serious cases, with a solution of one-tenth part perchloride of iron. But as good food is the best prevention of scurvy, one's best attention should be given before all things to the choice of provender. Preserves are, in this respect, a valuable resource. Salt fish, oatmeal, chocolate sometimes pork, and all sorts of live meat should be taken on board before departure. As regards drink, coffee and tea, according to the experience of navigators, appear preferable to wine or alcoholic beverages.

If, as it seems, a few little precautions suffice to preserve a good state of health in cold climates, it is not so in hot countries, when the height of the temperature is of itself sufficient to endanger life. It is of importance, then, to protect oneself against the heat and refraction of the sun. Some Europeans have, with this end, adopted the Arab costume *in toto*, while others have contented themselves with the assumption of their head-dress. This latter consists of a cap or *chechia*, circled with a thick fringe of wool, and covered with an upper garment forming a hood. The majority of people prefer the colonial *casque*, which is composed of a strip of cork, resting upon the head and a shell made of aloes, or of the pith of rushes; it is completed by a neck-covering, which extends just far enough to the front of the figure to protect it from wind and dust. Whether one adopts the *chechia* or the *casque* one is almost certain of the protection of insulation. As to clothing, there is nothing special to say about it. If one makes any change in his customs, he should do so gradually without undue haste. The Arab costume offers, however, great advantages; the shoes have solid soles, sufficiently pliable to avoid fatigue, and are furnished with leg-guards to ward off the attacks of reptiles and other venomous creatures. The most practical kind of bed is the hammock, slung to two branches of trees or mounted on two pairs of stakes; a mosquito net should be fitted up to keep off the insects, and to sift the humidity of the atmosphere. In default of a hammock, at least two thicknesses of woollen blankets should be spread on the ground, one piece of india-rubber cloth. Stanley's bed consists of four planks of palm leaves, and of a leathern bag which serves as a pillow; he

always lies down in his clothes, thereby protecting himself from troubles of the bowels, and from bronchitis."

If the food supply should run out, one is less embarrassed here than in cold climates; savoury, wholesome, and nutritious foods are very abundant in hot countries. The banana, among others, is to be found almost everywhere, and the same may be said of the date and the fig. From the two former a food of the greatest service is derived.

Rice, maize, and tapioca are precious resources. The Spanish potato, the yam, and the water-melon, too, are foods of an agreeable flavour. Travellers can easily procure fowls and eggs, but it will be prudent before going away to be provided with preserved meats, packed in well-sealed cases, not embossed on the upper side; these almost always show a commencement of fermentation.

As regards drink, the traveller should be provided with a gourd of wine or brandy, to serve him in case of need, nothing more.

What rules, then, should be observed in order to please oneself beyond the reach of diseases of hot countries? The most dreaded affections of these countries are fevers, liver complaints, and intestinal troubles. Hepatic diseases and enteric troubles will gain no hold upon those who maintain a good system of diet. Slight premonitory diarrhoea may be arrested by an opiate preparation, either laudanum or extract of opium.

M. Gréhaut wished only to prescribe general measures of prevention, but as he has formulated them, they will render inestimable service to their hardy pioneers who have accepted the heroic mission of carrying to distant lands the fame and the religion of their country.

## USE OF POULTICES.

IT IS NOT UNDERSTOOD AS GENERALLY AS IT SHOULD BE.

PHYSICIANS are often surprised at the ignorance of patients concerning the use of poultices. The trouble arises from a wrong idea as to the curative action of a poultice.

In general, poultices are primarily localisers of inflammation; they act by softening and stimulating the tissues with which they are brought directly in contact. The fact that their value lies in the amount of heat and moisture which they radiate to these tissues is the reason, probably, for their application by the laity in every case where heat and moisture may happen to be indicated as necessary.

Take, for example, two cases—a poisoned wound and a finger swollen by muscular strain. It is manifest that these two cases are not parallel, though in both the application of heat is indicated as a remedy.

In the case of the poisoned wound, we have the presence of a foreign substance in the tissues. This sets up a local inflammation, which by means of the circulation tends to spread and become general. We place a poultice over the affected part, and immediately the application of the heat brings to it a fresh supply of blood containing numerous leucocytes—white corpuscles—whose business it is to make war upon all foreign matter with which they may come in contact, and pus is formed. This finds a proper means of escape through the softened tissues under the poultice, and with it comes the poison.

In the case of the swollen finger, on the other hand, we have a simple irritation, and what we need in the way of treatment is just enough heat to draw a renewed supply of blood to the weakened part for its nourishment. But we do not wish, as in the first case, to confine the heat long enough to stimulate the leucocytes to activity, as in that event we should only have made a bad matter worse, with an abscess to take care of.

The desired result may be obtained by simply plunging the finger into water as hot as can be borne for a short time, or by rubbing on a stimulating liniment.

The moral of all this is, that we are to use poultices only where we wish to localise inflammation. In sprains and the like proper stimulation is all that is required.

## TROUBLED MINDS AND TIRED BODIES.

RESTFUL ADORNMENTS FOR THE "LIVING ROOM."

By ANNA SAWYER.

THE wise home-maker of to-day surely has no apartment sacred to the use of the chance visitor, and instead a true "living room" is open to the family, where the best there is dedicated to its use. Such a room has a charm which no darkened and shrouded gorgeousness can hope to equal, and in its atmosphere the spirit of home-love will flourish. But there are yet many to whom this wisdom has not come.

Pass through an average country town after darkness has fallen, and the working hours of the day are practically over. Are the lights not few and far between which gleam from other than kitchen casements? The patient woman who has laboured through the long hours now seeks her rest in the scene of her labours. And yet even a slight change is a vital necessity for her, did she but know it. The reasons which she will urge against the feasibility of the plan are apparently good—"want of time" the "extra expense," "duties unsuited to a 'parlour,'" and behind all, the only strong one is "habit," the habit of generations.

The kitchen, from the very nature of its office, is unfit to be the home centre; in many homes the dining room serves the purpose, yet is scarcely more suitable. There should be some spot reserved as a resting place for body and mind; no stately inner temple, no "holy of holies," but a chamber apart from the cares of the day, where if one must bear them hither, it will be to carry them more lightly.

The matter of expense is the last which should be considered here. Let the wise woman who would have a true "living room," clothe herself in the armour of simplicity, and be content with the adjustment of small means to great ends.

One emancipated sister, spending her days in hard labour for the necessities of life, considered her moments of leisure too few to be wasted, and realised that she owed it to herself, and her two young daughters, to spend them well. The unfurnished room was at hand, little else, and none of the mysterious forces, usual in the stories of such attempts, bestirred themselves here. Instead, odd bits of carpets were pieced into a square rug, more for warmth than beauty; shades were cut from an old sheet, the walls were papered by her own hands. In the centre of the room a wooden box, covered with a shawl, served as a table, and three chairs were found among the sparse furniture. The two natural advantages of the place were utilised to the utmost—the open fireplace and the two sunny windows. Here she brought her few books and ornaments, and one picture, a woodcut of the "Holy Night." A very slight beginning, one which few women would have courage to risk, yet the room became by degrees an ideal confirmation of the adage that there is "no place like home." Yet what was back of this success? One woman's determination to do her best with the means at hand, and at that time. Such food may come too late; starvation may be none the less sure because it is slow. No effort beyond our means is just or right, but we may make use of those available, content them to wait and to take pleasure in meagre fare.

Even the favoured ones of fortune have often need to learn to use the gifts of the gods aright, and by giving the best to their own they may practice a laudable selfishness. I would offer of that best to my friend, but he should partake of it together with those who are nearer to me still. My child shall then grow up without awe of these same "best things"; in its stead shall he keep a loving remembrance of their usefulness.

As children say, "let us suppose." It would trouble me not one whit if I must use a painted floor in this home-room of mine, instead of carpet or rug, but expensive curtains would trouble me in the same connection, and so I shall strive for tinted walls and paper shall content me, because of its plain surface. I

shall make a rug if I cannot buy one, perhaps of denim and old white cotton knit "hit or miss" in strips, perhaps in strips of flannel or of cloth. I shall like much blue here, for my walls are of the soft sage tone with which it harmonises. Bought or wrought, my rug shall be soft toned and patterned, too. Small means can afford nothing striking; good taste can seldom do so. I shall be contented with simple furniture, nor expect to buy it all at once, and though I have seen wonders done in the matter of metamorphosis, I shall not go out of my way to transform a broken-down article into a gilded nuisance. I may like to drape my mantle with a length of denim, its white side turned against the blue in a hem. If this should be bodily worked in white it will please me more if the labour has afforded me beneficial change of occupation, but I shall take pleasure in the drapery without embroidery.

I shall have as large a table as may be, perhaps in the centre of the room, perhaps not. It will stand where it will conveniently fill its office. If this needs a cloth it may be denim again or any available article within my reach. I shall not wish colours to clash, but I shall certainly not match these, for this room must be an "omnium gatherum" in the best sense. By choice I will have nothing which will interfere with the addition of any tint.

I will have a few plants—very few, for they take light and space. My books will be here, my papers, pictures, workbasket, the stocking basket, as well as that for fancy work. This last will be done more as a relaxation than as means of decoration, for I am very sure that I shall usually feel the money better spent in buying a book, a picture, a bit of beautiful glass, or of yellow or red pottery which will give the little gleam I want here and there. I would have as many beautiful things as might be, but the homely ones as well, so that the motto of my room will be, "Use and beauty."

And all these things must be arranged for the occupants, their best service. No bronze or vase shall stand in the window; if I have brought it for the passer-by, I will set it rather upon my doorstep. Neither shall such flowers as come to me be placed there to be scorched in the summer, or frost-bitten in winter, to die the sooner the year round.

For my pictures, few will suffice, but never poor ones, for I certainly shall not believe poor ones better than none, but this would not exclude the inexpensive.

People do not always realise the part the pictures on their walls bear in the education of their children. Give the young good books, good pictures, and half the battle is won. And such specimens as I have shall be hung properly, which will not be so high above my head that I must crane my neck to see them, but on a level with my eyes. The frames I shall regard little except so far as they may complete and preserve the picture, so I shall have no place for such as are obtrusive in their own right.

To some of the tired sisters to whom I would so gladly speak with greater force, even the simple outline sketched above is out of reach; to such I say, begin an "ingle nook," however humbly. Your tired bodies need it, far more the tired minds "troubled about many things;" but argument of greater weight to the true woman, your children need it even more, and, however wise you are to teach these the dignity of labour, teach them as worthily the dignity of well-earned rest.

DOING AND BEING.—In the end experience will inevitably teach us that the laws for a wise and noble life have a foundation infinitely deeper than the fiat of any being, God or man, even in the groundwork of human nature. She will teach us that whoso sheddeth man's blood though by man his blood be not shed, though no man avenge and no hell await, yet every drop shall blister on his soul, and eat in the name of the dead. She will teach that whoso takes a love not lawfully his own, gathers a flower with poison on its petals; that whoso revenges, strikes with a sword with two edges—one for his adversary, one for himself; that who lives to himself is dead, though the ground is not yet on him; that who wrongs another clouds his own sun.—*Olive Schreiner.*

## TOBACCO, AND ITS EFFECTS UPON THE YOUNG.

TOBACCO contains, among its most active ingredients, a substance called nicotine, composed of nicotine proper and of a bitter extract; the smoke also contains carbon, ammonia, and an empyreumatic substance, carbonic acid, and oxide of carbon. The effects produced upon the organism may be summed up as follows:—The free carbon is an irritant, and discolours the mouth and teeth; the ammonia taking hold of the tongue, produces a dryness in the mouth and throat, excites the salivary glands, and has a dissolvent influence upon the blood; the carbonic and oxide of carbon are poisonous, and produce drowsiness, headache, and lassitude; the latter even causes irregularities in the beatings of the heart, spasmodic contractions of the blood-vessels, and vomiting. Nicotine proper, produces vomiting, diarrhoea, giddiness, palpitation, muscular feebleness, and cramp in the stomach. It brings on death more promptly than any other poison, with the exception of prussic acid. A twenty-second part of a grain produces muscular spasms and other effects, continuing for three days. The empyreumatic substance causes depression and imparts a bad odour to the breath; the bitter extract has a bad taste and causes vomiting; the effects of the smoke on insects—cheese-mites, flies, bees, and wasps—are convulsions and death.

One of the first effects of tobacco smoking on the stomach, is nausea and vomiting; it influences the nervous system, produces dizziness, muscular tremblings, and spasms, extending to the muscles of the chest and heart; it causes despondency and bitterness, sharp pains in the chest when breathing, and in the end death, if the poisoning is carried to the extreme.

When one first begins to smoke, the brain empties itself of blood, and as a consequence the stomach becomes flushed; the blood is abnormally liquid, the lungs become pale, the heart is surcharged with blood and is capable of contracting, and if the cause of the evil is not removed it ceases entirely to beat. The organs little by little accustom themselves to the poison and suffer less. The lungs, the skin, and the kidneys without the assistance of the blood carry off the toxic agents, hence the odour of the breath and the perspiration.

If the use of tobacco is excessive, it may produce very great changes in the tissues or in the functions of disorders, so serious indeed as to endanger life. Old pipes saturated with nicotine and bitter extract, strong tobacco, snuff, and chewing tobacco, are all very dangerous. Cigars and cigarettes smoked to the end are also very bad. Smoking augments the secretion of saliva—this saliva sometimes deposits on the teeth a crust of salts of lime, called tartar. No one has been able definitely to establish the relation of cancer of the tongue and throat with the use of tobacco, save in the case of persons predisposed to cancer. On this case an irritant such as the presence of smoke in the mouth, or the pressure of a short, hot pipe between the lips gives rise to trouble. The abuse of smoking seriously prejudices the heart's power of contraction, produces irregularities in its pulsations, brings on palpitations and a sensation of depression and despondency. Again, tobacco has a bad influence on the lungs, it poisons the air resired and enfeebles the digestive functions. The spinal nerves may be affected in such a way as to produce spasms of the muscles followed by paralysis.

One observes that youths who before contracting the habit of smoking were resolute, vigorous, and energetic, become faint-hearted, timorous, hesitative, and irresolute. Vivacity of spirit disappears with bodily vigour. Let them, then, guard against the treacherous and noxious cigarette, and let them have nothing to do with the drug, before the introduction of which men fully understood how to be "happy and wise." Tobacco produces a nervous depression such as makes one feel the necessity of relief for the moment in the drinking of beer, wine, or alcohol; it parches the mouth and throat and creates thirst. Alcoholic intemperance is too often the consequence of intoxication by tobacco.

## THE OLD AND THE NEW SPIRITUALISM.

DISCUSSING the subject of comparative psychical research in the September number of the *Contemporary*, Mr. Andrew Lang points to many strange coincidences in the experiences of spiritualists, new and old. "A large book might easily be filled with old stories of mysterious flights of stones, and volatile chairs and tables. In the presence of Home, even a book-case is said to have forgotten itself, and committed the most deplorable excesses. A table jumps by the bedside of a dying man. A handbag of Miss Power's flies from an armchair, and hides under a table; raps are heard; all this when Miss Power is alone. Mr. H. W. Gore Graham sees a table move about. A heavy table of Mr. G. A. Armstrong's rises high in the air. A tea-table 'runs after' Professor Alexander, and 'attempts to hem me in,' this was at Rio Janeiro, in the Davis family, where raps 'ranged from hardly perceptible ticks up to resounding blows, such as might be struck by a wooden mallet. A Mr. H. falls into convulsions, during which all sorts of things fly about. All these stories closely correspond to the tales in Increase Mather's 'Remarkable Providences in New England,' in which the phenomena sometimes occur in the presence of an epileptic and convulsed boy, about 1680. To take one classic French case, Segrais declares that a M. Patris was lodged in the Château d'Egmont. At dinner-time he went into the room of a friend, whom he found lost in the utmost astonishment. A huge book, Cardan's 'De Subtilitate,' had flown at him across the room, and the leaves had turned, under invisible fingers! M. Patris laughed at this tale, and went into the gallery, when a large chair, so heavy that two men could scarcely lift it, shook itself and came at him. He remonstrated, and the chair returned to its usual position. 'This made a deep impression on M. Patris, and contributed in no slight degree to make him a converted character.' Tales like this, with that odd uniformity of tone and detail which makes them curious, might be collected from old literature to any extent. Thus, among the sound usually called 'rappings,' Mr. Crookes mentions, as matter within his own experience, 'a cracking like that heard when a frictional machine is at work.' Now, as may be read in Southey's 'Life of Wesley,' and in Clarke's 'Memoirs of the Wesleys,' this was the very noise which usually heralded the arrival of 'Jeffrey,' as they called the Epworth 'spirit.' It has been alleged that the charming and ill-fated Hetty Wesley caused the disturbances. If so (and Dr. Salmon, who supports this thesis, does not even hazard a guess as to the *modus operandi*), Hetty must have been familiar with almost the whole extent of psychical literature, for she scarcely left a single phenomenon unrepresented. It does not appear that she supplied visible 'hands.' We have seen Glanvil lay stress on the apparition of a hand. In the case of the devil of Glentuce, 'there appeared a naked hand, and an arm from elbow down, beating upon the floor till the house did shake again.' At Rerrick, in 1695, it knocked upon the chests and boards, as people do at a door. 'And as I was at prayer,' says the Rev. Alexander Telfair, 'leaning on the side of a bed, I felt something thrusting my arm up, and casting my eyes thitherward, perceived a little white hand, and an arm from the elbow down, but it vanished presently.' The hands viewed, grasped, and examined by Home's *clientèle*, hands which melted away in their clutch, are innumerable, and the phenomenon, with the 'cold breeze,' is among the most common in modern narratives. Reports of apparitions, and of second sight, are no less curious, in their uniformity of incident and character than the physical manifestations. Our only conclusion is that the psychological conditions which begat the ancient narratives produce the new legends. These surprise us by the apparent good faith in marvel and myth of many otherwise credible narrators, and by the coincidence, accidental or designed, with old stories not generally familiar to the modern public. Do impostors and credulous persons deliberately 'get up' the subject in rare old books? Is there a metho

of imposture handed down by one generation of bad little girls to another? Is there such a thing as persistent identity of hallucination among the sane?

## "LOSS OF WIND" IN RUNNING.

PROFESSOR MICHAEL FOSTER discourses on "Weariness" in the *Nineteenth Century*. He points out that the distress occasioned by running is in great measure, if not chiefly, determined by the failure of the organs during the changes which are set up by exertion to keep the blood adequately pure. Something depends on the vigour of the muscles themselves. Something depends on the mechanical breathing-power of the individual. A great deal depends on the readiness with which the heart responds to the greater strain upon it. For there is a long physiological story concerning the ties which bind together heart, muscle, and lungs in such a way that what we call "loss of wind" is much more the stumbling of the heart in its strivings to meet the altered blood flow than mere mechanical insufficiency of the respiratory pump. But beyond and above all these, more important probably in long-continued labour than any or all of them, is the readiness with which these internal scavengers free the blood from the poison which the muscles are pouring into it. Undue exertion is that in which the muscles work too fast for the rest of the body. Sometimes these organs are slow in settling down to their work; they do not keep pace with the muscles and an initial distress comes because they are not as yet ready; but by-and-by they awaken to their task, they set vigorously to work, and the runner gets his "second wind." They too, however, are subject to fatigue, and in a prolonged struggle after a while fail where at first they were effective. As they slacken their efforts, the poisons are more and more heaped up, poisoning the muscles, poisoning the brain, poisoning the heart, poisoning at last the blood itself; starting, in the intricate machinery of the body, new poisons in addition to themselves. The hunted hare run to death dies, not because he is choked for want of breath, not because his heart stands still, its store of energy having given out, but because a poisoned blood poisons his brain, poisons his whole body. So also the schoolboy, urged by pride to go on running beyond the earlier symptoms of distress, the mere loss of wind, struggles on until the heaped-up poison deadens his brain, and he falls dazed and giddy, as in a fit, rising again, it may be, and stumbling on unconscious, or half conscious only, by mere mechanical inertia of his nervous system, only to fall once more, poisoned by poisons of his own making.

## DANCING AS AN EXERCISE.

IT is always in the colder months difficult for people who live in towns to get exercise. By women and girls especially the sudden cessation of activity, which the return home after the summer outing means, is felt as a positive injury to health; and the knowledge that for many months no better form of exercise than a formal walk through crowded streets will be available, is to them extremely depressing. Many, in the hope of warding off the bad effects of inactivity, betake themselves to the gymnasium, and attempt there unaccustomed feats of endurance. Unfortunately, the number of women to whom gymnastics in their more vigorous form is, or likely to be, beneficial, is comparatively small; and there is always a certain amount of risk in commencing after maturity physical exertions which are better suited to the lighter weight and more supple body of a young girl. Certainly gymnastics, fencing, and athletic exercises of all kinds, demand, if they are not to prove absolutely injurious, many years of slowly progressive training; and so are hardly within the reach of a woman whose muscular education has not been attended to from quite the beginning of her school-days. For such people, and for girls in the transition period between childhood and young womanhood, there is nothing better as a habitual and everyday exercise than dancing.

By dancing, however, must be understood not the conventional performance of the ball room, nor the showy calisthenic exercises which require most vigorous and thorough training. The usual stately movements gone through in the preparation for social functions have hardly any use as exercise, or as means towards bodily development; stage dancing, on the other hand, requires a considerable amount of physical activity, and, if properly taught and practised, gives increased power and freedom to every muscle.

With regard to daily practice, there is this real advantage about the work, that when once its principles are understood and mastered, it can be done in any ordinary sized room. Any girl can go through the whole range of exercises in her own bedroom, or, indeed, anywhere that there is an available space five or six feet square. It is a good habit to practise before a looking-glass, so that any wrong movement may be at once detected, and for the same reason no garments should be worn that are likely to conceal the real action of the limbs. For a class lesson, the best costume is a gymnasium dress consisting of a loose blouse and baggy knickerbockers; but at home, less covering would be necessary. An elastic woollen combination would probably be as convenient as anything; but whatever is worn, it must nowhere to the smallest extent impede free movement, and it must on no account be stiff and unresisting. With ordinary precautions as to costume and with reasonable attention to the right principles of training, there is not in any one of the exercises any danger of injury. The serious accidents that occasionally befall the foolhardy in a gymnasium are quite outside the range of possibility, and yet the physical benefits of dancing are quite as real.—*Pioneer of Fashion*.

## PURE AIR AND HEALTH.

TO-DAY we wish to treat of a subject of vital importance—Pure Air. If we consider that the air fills our lungs, and that they are, so to speak, the bellows of our body, we understand how important it is not only that there should be plenty of it, but that it should also be pure and uncontaminated.

Although this precept ought to be known to everyone, yet it seems one pleases himself whether or not he observes the rules that govern ventilation; properly speaking, there is hardly a public building or a private house that can conveniently be ventilated. Out of a hundred rooms, large and small, there are ninety which have not sufficient provision, either for the egress of vitiated air or for the admission of pure air.

Almost all rooms are too warm; people believe in making themselves comfortable, though in reality they are injuring their health.

The trouble one takes to prevent the free penetration of air to one's rooms, causes that air to become an element of destruction, instead of being, on the contrary, an active and salutary agent of life; thus one shuts the doors and windows, closes the shutters, draws the curtains, and does everthing in short to vitiate the atmosphere.

To this cause we must attribute our chills, colds, and rheumatics, for there is always danger in passing from a superheated atmosphere to the influence of the outside air.

We will quote an illustration to point our remarks:—

A gentleman of our acquaintance had a large family whose members were accustomed the greater part of their time to run out into the nursery, a room most comfortably appointed according to current ideas. The children constantly passing from the warm air inside to the cold air without, were, owing to the slight change of temperature, continually contracting chills and colds. One winter, however, they were exempt, and the parents were so astonished that they sought for the cause of this remarkable anomaly. It was discovered that one of the window panes had been broken, and had not been replaced, consequently there had been a continual current of fresh air into the room.

Draperies around a bed are eminently prejudicial to health; the reason of this is very simple, since it can but be highly injurious to pass the greater part of one's life in a shut-up space. This is in a great measure the cause of

the languid feelings of which so many people complain when they rise in the morning. The sleep which one gets under these circumstances, far from being refreshing, is injurious.

It is so easy to ventilate rooms that one is really not to be excused for neglecting to do so. In each window, there should be a moveable pane, of which one can regulate the movement so as to obtain a continual supply of fresh air.

Bed-chambers should be large and high up, and not such as they generally are—the greater number of people sacrifice their larger rooms for the sake of show, instead of having them for spacious bedrooms. Drawing-rooms are not used one month in the twelve, whereas the bedroom is tenanted at least ten hours out of the twenty-four.

The atmosphere of ball-rooms, theatres, and places of public meeting is very bad.

To sum up, then, pure air ought to be sought for as the indispensable necessity to the vital functions.

## COLDS.

By E. M. KENNEDY.

CONTRARY to the prevalent opinion that colds and coughs are due entirely to the severity of the climate, or to some unexpected change in the weather, they really arise, in very many cases, from pure carelessness and want of thought.

Colds are not inevitable, but could often be avoided if people would only use their ideas of common sense and be reasonable.

The custom of muffling the neck very closely with furs or similar protection is extremely dangerous. If thoughtlessly left off, a severe cold is sure. A light wrapping, sufficient to exclude cold wind, while permitting ventilation, gives the best protection.

For instance, if one sits in a heated room while paying a visit, or during the services at church, without removing any of the many wraps which have been donned for the cold atmosphere out of doors, the result is almost sure to be a severe cold, contracted by the sudden change from the heated room to the cold air.

Sleeping in badly ventilated rooms, wearing at night the underclothing which is worn through the day, late hours, loss of sleep, greasy food, and irregularity of meals, all tend to weaken the system to such an extent as to render it quite incapable of resisting the changes in the weather or any exposure to disease. While we all advocate cold and well ventilated sleeping apartments, we, at the same time, must condemn the cold room for dressing in the morning. It is most unhealthy, and a delicate person might receive such a shock as to result in fatal injury.

When at all possible, one should have a warm dressing room close at hand, but if the home is not so luxurious, the family sitting room could be utilised for this purpose, only a very short time being required by each person. A dressing gown and a pair of warm bedroom slippers should be put on as quickly as possible, and the clothes could be carried to the sitting room, where half the toilet could be performed in a very few minutes.

La Grippe has made such terrible ravages amongst us, that the smile that once arose when reference was made to it, has now changed into a grave and very serious expression. The family drug store should be kept well stocked, for it may contain something which shall prove to be invaluable in relieving the sufferer before the doctor could be summoned. Four grains of quinine taken every three hours until the temperature is normal, should speedily allay the fever. A mustard plaster or linseed poultice, will be found to be very soothing when there is much pain, while a hot water bottle will soon send the blood flowing properly through the body.

The trouble with many people is that they never think of taking care of themselves until the malady is an established fact.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional). Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

## FAT.

WHEN we consider that fat forms about a fifth of the weight of our body, we see how necessary it is that we shall continually replace that which is lost by oxidation. In wasting diseases nearly the whole of this fat disappears, and then the problem sets in as to how we are to restore it. Fat is formed from the starch and sugar we eat, as well as existing in food, but not in sufficient quantities to supply the impoverished system with its loss, so that we must look for some substance which will replace the deficiency in a more rapid manner than either sugar or starch. And years of practical experience points to cod-liver oil as the most valuable remedy. It is a powerful tonic to the nervous system, as well as an increase to the adipose tissue. "But I can't take cod-liver oil," usually exclaims the invalid, more especially if a child. And this is its great drawback. Patients set their mind against it, and where pressed it is apt to cause nausea and derange the appetite. Now there is only one natural method of administering the oil, and that is the same as we do with all other fats—viz., with a food. We administer butter with bread, and Nature gives us the fat of milk with caseine. So I find the best means of giving the cod-liver oil is with a food, as in the Cream of Malt, with Cod-Liver Oil, and Hypophosphites (Oppenheimer's). The Cream of Malt is a true food, being nothing more or less than a concentrated form of malted barley. In this way you will find children take the oil readily and, indeed, a medical friend of mine relates an amusing story of how one of his children was caught in his surgery stealing the Cream of Malt from the bottle, and evidently enjoying it. Fat is absolutely necessary to retain health, but in order to utilise it, it must be presented to the system in an assimilable form.

## SENSE OF TOUCH.

IF there is any subject that people in general think they are specially familiar with, that subject is their own sense of touch or skin-feeling. Yet how few will not be surprised to learn that the points of a pair of compasses held two and three-fifths inches apart against the middle of one's own back feel like but one point? If opened out to two and a half inches they feel like two. This was discovered by Weber in a series of experiments, to which Mr. Herbert Spencer has lately called attention. Weber found the tips of the forefingers could feel the two points when they were one-twelfth of an inch apart, but not when closer together. Between this fine sensitiveness and the coarse sensitiveness of the middle of the back all the outer parts of the body vary. For instance, the inner surface of the second joints of the forefinger can distinguish the two compass points one-sixth of an inch apart. The innermost points have less sensitiveness of this sort, but rank in it equal with the tip of the nose. The end of the toe, the palm of the hand, and the cheek have alike one-fifth of the perceptiveness of the tip of the forefinger, and the lower part of the forehead has one-half that of the cheek. The back of the hand and the crown of the head are nearly alike in having fourteen times less sensitiveness of this sort than the tip of the forefinger. The thigh has less near the knee, and the points of the compasses must be an inch and one-half apart before the breast ceases to feel them as one. Mr. Spencer accounts for these differences on the ground of the greater practice of some parts of the body in feeling various objects. For instance, the finger-tips are educated in the matter, and their qualities transmitted by inheritance to successive generations. The tongue, always feeling the teeth, and often feeling particles of food, is still better educated. Its tip can distinguish between compass points one-twenty-fourth of an inch apart, and is the most sensitive member of the body. Mr. Spencer's theory agrees with some well-known facts. For example, he showed what was pretty well known long before he was born, that the finger-tips of the blind are more sensitive than those of persons who can see,

and who, therefore, do not practice their sense of touch so much. He also found that skilled compositors were more sensitive than the blind on whom he experimented, for the compositors could distinguish both compass points when one-seventeenth of an inch apart.

It may be suggested that many facts could be adduced to show that parts of the body do not become more but less sensitive by continual touching of things. The fingers of a seamstress are often "calloused" by needle pricks or pressures, and yet she is always as much seeking to avoid the pricking as the compositor is to seize but one type.

But in such scientific matters theories are plenty and easily made. The facts themselves are the interesting things, as are all pieces of novel information about the wonderful human body.

## AN INDIAN CHOLERA SONG.

[The following is said to have been written by Captain Dowling, of the East India Company service, during a severe epidemic.]

WE meet 'neath the sounding rafter,  
And the walls around are bare;  
As they shout to our peals of laughter  
It seems that the dead are there.  
But stand to your glasses, steady!  
We drink to our comrade's eyes;  
Quaff a cup to the dead already,  
And hurrah for the next that dies!

Not here are the goblets glowing,  
Not here is the vintage sweet;  
'Tis cold as our hearts are growing,  
And dark as the doom we meet.  
But stand to your glasses, steady!  
And soon shall our pulses rise;  
A cup to the dead already;  
Hurrah for the next that dies!

Not a sigh for the lot that darkens,  
Not a tear for the friends that sink;  
We'll fall 'midst the winecup's sparkles  
As mute as the wine we drink.  
So, stand to your glasses, steady!  
'Tis this that the respite buys;  
One cup to the dead already;  
Hurrah for the next that dies!

Time was when we frowned at others;  
We thought we were wiser then.  
Ha! ha! let them think of their mothers  
Who hope to see them again.  
No; stand to your glasses, steady!  
The thoughtless are here and the wise;  
A cup to the dead already;  
Hurrah for the next that dies!

There's many a hand that's shaking,  
There's many a cheek that's sunk;  
But soon, though our hearts are breaking,  
They'll burn with the wine we've drunk.  
So, stand to your glasses, steady!  
'Tis here the revival lies;  
A cup to the dead already;  
Hurrah for the next that dies!

There's a mist on the glass congealing;  
'Tis the hurricane's fiery breath;  
And thus does the warmth of feeling  
Turn ice in the grasp of death.  
So, stand to your glasses, steady!  
For a moment the vapour flies;  
A cup to the dead already;  
Hurrah for the next that dies!

Who dreads to the dust returning?  
Who shrinks from the sable shore,  
Where the high and haughty yearning  
Of the soul shall sting no more?  
So, stand to your glasses, steady!  
The world is a world of lies;  
A cup to the dead already;  
Hurrah for the next that dies!

Cut off from the land that bore us,  
Betrayed by the land we find,  
Where the brightest have gone before us,  
And the dullest remain behind.  
Stand! stand to your glasses, steady!  
'Tis all we have left to prize;  
A cup to the dead already,  
And hurrah for the next that dies!

## THE LAND OF CHOLERA.

A PLAIN story of the conditions that prevail in India for the spread of the cholera was told lately at the New Century Club by Dr. Pauline Root, of the Woman's Medical College, who has lived for eight years in Southern India. Dr. Root began by describing the conditions under which people live in Southern India, in order to show exactly what circumstances generate the cholera. There is absolutely no sanitation there as we have it. Drainage, with the exception of a fever-breeder in the way of an open sewer, is unknown. In the villages, the people live in low mud huts, where all the family congregate in one room, the dimensions of which are likely to be four feet by ten or twelve feet. As there are no out-buildings at all, there is no way in which persons can protect themselves against the cholera if it once appears in such a household. Sometimes, if the well runs dry, stagnant water must be used. A high-caste personage will not allow a low caste to use his well.

Commonly people go to the river for water. As the water is frequently not on the surface a "tub" is dug in the river bed, and the water allowed to collect. At this tub, or at the well, all the functions of bathing are performed. First, the jar is filled, and the water being dashed over the person soon trickles back to its source. In the case of certain religious enthusiasts, water is poured over the body fifty times. Next, the seely, the single piece of silk or cloth, which is worn as a garment must be washed. This is dipped into the pool. Finally the jar is refilled and carried home. The quality of the water by the time the jar is refilled is promising indeed when cholera is in the air. In these river tubs the clothes are washed. The cattle are taken there to drink.

Dr. Root said that in sending a man to the river to fetch water there was never any certainty whether that he would not fill his jar with the water standing in one of the pools, instead of digging a fresh hole. The very cleanliness of the people, and they are extremely clean, tends to the spread of cholera, because their method of bathing is so unintelligent. In Southern India there is always more or less cholera. It is often prevalent after a certain religious festival—of the marriage of two divinities, which is celebrated by an encampment in the river bed for four or five days.

As for facilities in caring for the sick in India, Dr. Root graphically showed how forlornly poor these are by describing her experiences in the house of the vice-president of the municipality of Madua, a wealthy man who arrayed himself resplendently when he came to ask her to visit his wife, thus showing his solicitude for his wife's condition. Undoubtedly he meant to do the best he could for the sick woman, for the doctor found her in a room adjacent to her husband's—a position of honour. The woman was badly crippled, and only able to crawl down from her cot. Beyond playing with children and polishing the jewels nothing relieved the monotony of her day. She was entirely uncared for. A hole in the wall for refuse was cleaned only once a day. The woman died of blood poisoning. And this is the way a sick person fared in one of the better houses! Usually a sick person is placed in a room that is reached from the house by crossing a court and passing through an alley. The alley usually has black slimy water in it. The room is seven feet square. In the court are often found the cow, chickens, and a number of persons. No wonder that, under such conditions, cholera spreads like wildfire. But cholera is always brought. It never starts of itself.

CONSIDER what we owe to the meadow grass, to the covering of the dark ground by that glorious enamel, by the companies of those soft, countless, and peaceful spears of the field! Follow but for a little time the thought of all that we ought to recognise in those words. All spring and summer is in them—the walks by silent scented paths, the rest in noonday heat, the joy of the herds and flocks, the power of all shepherd life and meditation.—*Ruskin*

## OUR POINTS OF DANGER AS TO CHOLERA.

THE outbreak of cholera in two of our Humber ports, and notably at Grimsby, says the *Lancet*, has raised the question in the minds of many as to what are our weak points and sources of danger. The better they are known the more likely we are to be able to cope with them. Hence we would briefly note those to which attention is now being directed.

Firstly, as to our coast line. It has never been pretended that mild and unrecognised cases of cholera could be absolutely excluded by any other than a rigid system of quarantine, which would exclude at the same time everybody and everything. The contention is that with a properly regulated system of medical inspection we are provided with a means of defence which is superior to any form of quarantine that is practicable. For a port district this means that medical inspection of all vessels which arrive from foreign countries, and at times including our coast traffic also, must be continuously and vigilantly carried out in order to arrest on the waters of the port in every case that is suspicious from the point of view of cholera. We do not know yet that this system was in progress at Grimsby before August 22nd, when, as is well-known, cholera had already been imported into that port. We wish, however, to emphasise the fact that to be really effective medical inspection of shipping must precede the advent of cholera.

Secondly, as to our inland districts. A source of danger, of course, arises directly any such introduction of cholera occurs from any failure in port administration. Such introduction may also arise where no such failure has taken place, because there are mild choleraic attacks which it is difficult to differentiate as such, especially at the commencement of an epidemic. The danger is greatest in districts where public water-supplies are liable to pollution, where private wells are sunk in a contaminated soil, and where the air, soil, and food are liable to be contaminated from faulty systems of sewerage and drainage, and where nuisance arises from faulty systems for the reception and disposal of excrement and refuse.

Thirdly, as regards the question of merchandize. In the first instance, we may deal with rags, concerning which so much has been alleged. It was pointed out ten years ago by Sir George Buchanan, that no introduction of cholera into England was ever known to have taken place by means of rags; but in the desire to exclude all recently contaminated articles of clothing and bedding, which so often form part of bundles of rags, there was a growing tendency until last year, to regard rags as being capable of communicating the cholera infection. In our comments on the Dresden Convention we have already pointed out that not one of the medical delegates present at that Conference could give any information to show that rags, in the commercial sense of that term, had ever served to convey cholera. This coincided with the English experience, and hence it was deemed to be right to limit the prohibition as to rags to recently soiled linen, bedding, and clothing, which stand in a different category. The recent Order of the Local Government Board makes this limitation. It is mentioned to the daily press this week that shoddy constitutes an especial danger. If it does, the danger would attach to those who unpack, handle, and tear up the shoddy; but the districts in which this is done have hitherto been marked by their immunity from cholera, though receiving the suspected article from districts where cholera has prevailed.

Fish is the next article to which danger is

said to attach, this allegation being the more prominent now because large quantities of fish are sent from Grimsby to different parts of England. It is difficult to imagine the exact circumstances under which fish, which reaches Grimsby by sea and is packed in cases without entering the town, can readily receive the cholera infection. For those who cook their fish before eating it, however, even this possibility need give no apprehension. It is, otherwise, however, with cockles, for the cockle bed at Grimsby lies by the sewer outfall. The great danger of the importation of cholera into this country lies in the fact that we have no alternative but to admit to our shores persons in apparent health, but who may be incubating the disease. Our efforts should be concentrated, firstly, in preventing the introduction of recognised disease, and, next, of so improving our sanitary circumstances that it shall not find the soil in which to multiply. These should be the prominent considerations which all sanitary authorities should set before themselves.

## BRITTANY'S HEALTHIEST SEASIDE RETREAT.

SAINT - GILDAS - DE - RHUIS.

WHEN a Breton has to leave his Province his one great, persistent desire is to return to it as soon as possible. He is never free from the *nostalgia* of home; a sentimental influence attracts him every to his native place. To revisit it at any time is a pilgrimage of love for him; for the strength of ancestral veneration still dwells in the heart of the Breton of to-day, and remains a kind of moral instinct within him.

There is no line of railway to Saint-Gildas-de-Rhuis. The traveller can only proceed as far as Vannes by rail; he will then have to hire a conveyance to take him and his luggage a distance of twenty miles or thereabouts, to the former place. There is a public *concom* which journeys to and fro between Vannes and Saint-Gildas, but it is slow travelling. That which will principally attract his attention on the way are the numerous cabarets—wine and spirits bars. The Breton, says an old local proverb, is born thirsty. "Il siffle sa bouteille comme un Breton" is a common saying. Next, the traveller's attention will be engrossed by the picturesque aspect of the beautiful Gulf of Morbihan, with its 300 islets, some deserted in spite of their tempting emerald-green swards, and others flanked with cosy villages and windmills. Here is Pont Sécac and its fishermen's huts; Saint-Colombier and Larzeau, where both man and beast generally make a halt for the purpose of quenching their thirst. On, on, one travels up a steep hill, when suddenly a church spire in the distance is disclosed to view. There lies Saint-Gildas and its one clean, trim street with detached houses having numerous niches harbouring all the saints dear to the Bretons. Sadly dilapidated are some of the effigies of saints; some with their toes and fingers broken off, others minus an eye, or a nose, or even an arm. The church stands in the very centre of the village, opposite the convent, which figures principally as the aristocratic inn of the place. One can obtain board and lodging either there, or at the house of the parish clerk, who is a landowner of some importance in the village.

Accommodation in both these places is wholesome, plain, plentiful, and inexpensive.

Saint-Gildas should not be overlooked by the tourist in Brittany. It will repay the trouble of going a little out of the way to visit it. Situated at the extremity of the south-west corner of the premonitory of Rhuis, and built on a rock overlooking the sea at the highest point of elevation in Brittany, this village owes it to its geographical position that it is reputed one of the healthiest spots on the west coast of France. Facing it is the wide ocean, and behind it is the Gulf of Morbihan, where one gets the sea breeze back and front. No epidemic seems to triumph over that breeze. Typhoid fever, which some fifteen years ago decimated the population of the neighbouring villages, respected Saint-Gildas. In the very first breath of sea air which fans the cheek one feels its bracing effect. For shade one must go to the foot of the rocks, or inside the grottoes, which are the great curiosity at Saint-Gildas. The walls of these grottoes are a brilliant quartz, always moist, reflecting tints such as are seen in rarest marble. They are roomy and elevated, and overhung with masses of huge rocks which, from the effects of the actions of the waves at high tide, present fantastically carved figures. Some of these figures extend to a long distance beneath the plateau of Saint-Gildas. When the tide is rising the waves rush into these grottoes with gigantic bounds, the roar of the sea during a tempest being heard on land for miles around. To visit the grottoes in safety it is necessary to watch the receding tide, and be careful to move away at its first turn. The ascents and descents through the rocks to the beach are not numerous, but having reached it there is the convenience of a few fishermen's huts for bathers at a spot where inland streams meet and fall into the sea through beds of lichen and moss, on which it is pleasant to lie in the shade.

There is a preponderance of women and children at Saint-Gildas. The former are modest and laborious; the latter chubby-faced, healthy, and strong. How many lives of delicate children have been saved by a more or less lengthy stay at this bracing seaside place? The men, a robust race, are either fishermen or coastguardsmen; and the naturally reserved and thoughtful nature of the Bretons renders them as unsophisticated and truthful as primitive people always are.

It is essential while sojourning at Saint-Gildas not to omit the early morning walk, for while it is good for the lungs it is at the same time gratifying to the eye. In front of one the boundless ocean sparkles beneath the rays of the rising sun, looking like a sheet of molten gold, with Houat and Hoëdic and Belle-Ile in the distance, and Quiberon with its deserted shore to the right; while behind one is the Gulf of Morbihan, where the breeze as it is wafted across the mainland comes laden with the odour of sweet laurel, and the scent of myrtle groves.

Houat and Hoëdic are also worth a visit. There the tourist will see a community of Fishermen, who, from generation to generation, for the last three centuries have adhered to their old habits and customs. They are thoroughly imbued with the spirit of their local traditions. They are total abstainers from spirituous liquors, so long at least as they remain on their respective islands. Their venerated priest, who is also their medical

## FAILING EYESIGHT

Persons suffering from Defective Vision (particularly those who have been unable to get suitable glasses elsewhere), should consult Mr. Bluett, who has had thirty years' practical experience in making and adapting Spectacles for every form of Defective Eyesight, and for which he has received numerous unsolicited testimonials.

The Eyes Carefully Examined and Sight Tested FREE. Spectacles from 1s. 6d. per pair.

F. BLUETT, Specialist in Spectacles,  
8A, GREAT PORTLAND STREET, W.  
[FOUR DOORS FROM OXFORD STREET.]

**SOLUTION "D."**  
PERFECT DEODORISER.  
**DISINFECTANT.**

Non-Poisonous.  
Non-Corrosive.  
1s. PER BOTTLE  
(Champagne Quarts).

Sole Agents for the United Kingdom :-

**THOS. HODGKINSON, PRESTONS, & KING,**

81, BISHOPSGATE STREET WITHOUT, E.C.

"The FAMILY DOCTOR conveys to its readers much Useful Information."—*The Graphic*.

adviser, will occasionally in cases of serious illness prescribe and give them a *petit verre* of cognac brandy. A coasting vessel leaves Saint Malo twice a week, and touches at Houtat and Hoëdic for the convenience of travellers.—*Pull Mall Gazette.*

# Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

## QUESTIONS.

**DEAFNESS.**—For several years I have been deaf, and am getting worse. An ear hospital advised an inhaler, which seems to benefit the throat, but not the hearing. A very distressing symptom is beating and buzzing noises, the left side being the deaf. My throat and ears ache very much in damp weather. Being a very nervous woman, I have wondered if that affects it.—"Johnson."

**ONIONS.**—Can any reader tell me how to pickle onions? "Mary."

**BURTON.**—I suffer from fluid in the knee joints, and am advised to go to Burton, Derbyshire. Can it be recommended, and is the living, &c., fairly reasonable?—"Jackson."

## ANSWERS.

**EMIGRATION.**—A man with a small capital is very dangerously situated in a colony. Go and have a talk with the chief clerk, Emigration Office, Broadway, Westminster, and you will get reliable information and advice. There is little chance for a store in Australia.

**DISTILLED WATER.**—It is a question of cost of plant and labour. All chemists, medical men, and photographers buy distilled water, finding it cheaper to do this than make it.

**CUCKROACHES.**—Pellitory is only injurious to insect life. Get the freshly-ground flowers from a wholesale chemist, put a handful in a bag, into which put your cat, and tie her up round the neck for an hour. This is a certain cure.

# ANSWERS TO CORRESPONDENTS.

Correspondents will, in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand, London, W.C.

## ADVICE GRATIS.

By a PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a *Postal Order* for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than *Thursday*, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on *Friday*. The answers to these will therefore appear in the issue of *Saturday week* following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

## The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:-

King's College Hospital.  
University College Hospital.  
London Temperance Hospital.  
West London Hospital.  
Hospital for Sick Children  
St. Peter's Hospital.

Nazareth House, Hammersmith.  
British Home for Incurables, Clapham-rise.  
Ophthalmic Hospital, King William-street, W.C.  
London Hospital.  
Charing Cross Hospital.

Plays Hymns, Popular Airs, Quod-diles, Waltzes, Pot-pouris, &c. No mere child can play it. Cash or easy payments. List of tunes and full particulars free.

DRAPER,

ORGANETTE WORKS, BLACKBURN.

City of London Hospital for Diseases of the Chest  
Evelina Hospital for Sick Children.  
Poor Box—Five Police Courts.  
St. Thomas's Hospital.  
City Orthopædic Hospital

**PHILISTINE**—1 and 3. Learn to pass a gum elastic bougie (No. 9 English) twice weekly. The chemist will show you how to pass it. Take the following mixture half-an-hour after each meal: Bicarbonate of potash fifteen grains, bromide of potassium twenty grains, infusion of gentian to half an ounce. 2. Yes. The ammonia will be useful, and if used only in moderate quantity will do no harm.

**W. DEW.**—Take the mixture ordered for "Philistine" in this column. It will answer for all purposes required in your case. By all means continue the cold bath, but why do you not allow the parts to have natural rest more frequently—say twice a week? Leave the battery alone. It is not safe to run the risk of misapplication, and you do not really need electricity. You are worrying yourself unnecessarily about your condition.

**TOMATO**—1. There is no reliable evidence that indulgence in the harmless healthy tomato has anything whatever to do with inducing a predisposition to the development of cancer. Your friends need have no fear on that score. 2. We have noted with satisfaction the exposure of that person, whose nefarious concoctions well deserved the punishment meted out to their originator.

**AP. LEWIS.**—If you wish to get better, you will need to take the exercise which your friends have already advised. The machine is run down, and unless care be taken to wind it up efficiently, and without delay, we fear you may suffer still more. Can't you get a change of air with complete rest for your brain, say for a month? You had better try what you can do in this direction, or the consequences may be serious. Take the following medicine three times daily between meals: Carbonate of ammonia four grains, bromide of ammonium twenty grains, tincture of bark one drachm. Water to one ounce.

**SUBSCRIBER.**—Are you male or female? What is your occupation? Diet? What are your habits? Do you take much exercise? Do you drink much tea or coffee? Have you ever been addicted to improper practices of any kind, or to alcoholism? Please let us have answers to these queries, together with any other particulars which you may consider important. Meanwhile, take a scruple of bromide of ammonium in an ounce of camphor water night and morning, and take care to keep the bowels acting regularly.

**BLANCHE.**—You are suffering more or less from the symptoms of change of life, and in addition have got into the way of thinking too much about your personal troubles. You must take more food early in the day; walk at least two miles every morning; take no tea or beer, but regularly before each meal a dose of the following medicine: Dilute hydrochloric acid five drops, bromide of potassium fifteen grains, sulphate of magnesium half a drachm, spirits of chloroform five minims, tincture of gentian half a drachm; water to half an ounce.

**GINGER.**—Only examination of the party most concerned would justify a specification of the causes responsible for the circumstance. However, we may suggest your reserving your energies for the three days preceding and succeeding the periodical flow, refraining altogether during the intermediate clear interval.

**BARBARA.**—You appear to have some obstruction of the uterine canal, together with congestion (chronic) of one or both ovaries. It is not easy to treat such a case by correspondence, but you will get some assistance from the following mixture, taken three times daily for three days before the commencement of the period, and continuing for four days after that has begun. Bromide of ammonium twenty grains, fluid extract of black willow half a drachm, glycerine twenty grains, tincture of hops half a drachm, water to half an ounce. Write us again after the next period.

**SALTASH.**—We have no doubt the trouble you refer to in the latter part of your nervousness and irritability which you experience. But it is a very difficult matter to treat. We should advise you to take a holiday—a perfect rest from all business. Go to some quiet uninhabited spot and vegetate for a week or two.

**HY. ROBERTS.**—The losses are evidence that you do not take sufficient outdoor exercise, and that you perhaps devote a large amount of attention to the consideration of personal matters. You must in the first place see that these points have attention; take care that you do not sleep upon your back; get out of bed, and empty the bladder on early waking in the morning; bathe the parts frequently with cold water, and take the following mixture night and morning: Bromide of potassium twenty grains, tincture of acacia roseacea ten drops, tincture of hops half a drachm, camphor water to half an ounce.

**DAMM.**—These spots have nothing to do with the attack of syphilis. They are, if your description be accurate, patches of herpes, set up by the irritation of decomposing secretion (in many people this happens very quickly). Your plan will be to wash the parts twice a day, drying thoroughly afterwards, then to apply some boracic acid ointment to the sore spots. After healing, you must learn to wear the parts uncovered, and by degrees the tissues will get hardened, and your trouble disappear. You should keep the bowels acting regularly, and drink no irritants such as beer or coffee.

**J. H. B.**—Yours is not an uncommon trouble after many years of marriage. We would advise you to begin treatment with the following mixture: Bromide of ammonium fifteen grains, tincture of cantharides five minims, tincture of nuxvomica five minims, water to half an ounce. To be taken night and morning for three weeks only. Should that be insufficient, you will have to undergo electrical treatment at the hands of a competent physician; but you must be careful to avoid all those persons whose advertisements are merely traps to catch the unwary. We shall be glad to give you further advice if you write at the end of the period named.

**ANXIOUS BERT.**—1. Yes, under prolonged treatment properly carried out under the direction of a qualified medical man. 2. Yes, for the present at any rate. 3. Yes, bathe the parts regularly three or four times daily with cold water, keep the bowels acting with a dose of sulphate of magnesia (one teaspoonful in water) taken each morning before rising, and take twice a day the medicine recommended to "J. H. B." in this column.

**J. E. HARDING.**—You are clearly suffering from erosion of the cartilages of the joint and consequent exposure of the surfaces of the bony epiphyses. It is not easy to recommend treatment in the ordinary way, but we have known good results follow treatment by cataphoric medication. See letter in "Medical Press and Circular" about Oct. 1890, paper in "Lancet" about March, 1891, on cataphoric medication and cocaine as a local anæsthetic. You will find the exact dates in the indices to those journals for the years named.

**G. KITCHEN.**—You need special treatment for the troubles named. As far as our experience goes, we have found but little good from dosing with strong medicines, even when confined to a length of time. However, you may try cold bathing of the parts twice a day, with a dose night and morning of the following mixture: Bromide of potassium twenty grains, tincture of hops half a drachm, tincture of gentian fifteen minims, water to half an ounce.

**ALPHA.**—We are very much afraid we shall not be able to suggest anything for your eyes without an examination, when you have already consulted an oculist in vain. It may be due to indigestion, and if so, you should study your diet, take proper active exercise, pay proper attention to the bowels, and live hygienically.

**GRATIS.**—These symptoms are all part and parcel of your indigestion. You should see a good all-round medical man or physician about your case, and keep under treatment for a month or two.

**ST. ANN'S.**—No, that should not be so. You must learn to pass a bougie (10 English) twice a week, retaining it in position for two minutes or longer at each application. Take also a dose of the following mix ure each morning: Sulphate of magnesia one drachm, carbonate of magnesium ten grains, peppermint water half an ounce. Wash the parts with soap and water every morning and dry thoroughly with a soft towel.

**A WORKING MAN.**—See reply to "Hy. Roberts," and take the medicines ordered in his case. At your age you might have known better; but you must now give up bad habits and endeavour to exercise proper restraint upon all indulgence. With patience your condition ought to improve, but it will take some time.

**T. B. S.**—Avoid coffee, stimulants, sugar, pastry, preserved foods, meat dishes. Take twenty minims of Fehling's syrup of the hypophosphites in water three times a day. Walk three or four miles or more daily, and every night at bedtime a scruple of bromide of potassium in half an ounce of camphor water.

**DEJECTED.**—You have given us but little time to publish our reply to your letter, and it will be impossible for you to receive it before you leave for America. However, you will no doubt be able to obtain a copy of the FAMILY DOCTOR without difficulty in the States. 1. There is no reason why you should not, under proper treatment, fully recover your powers, remembering always that as we advance in years the edge becomes less keen. 2. These treatments, so-called, mean only waste of time and money, together with much disappointment. Read reply to "Ap. Lewis," and take the medicine ordered in his case.

**E. H. TOM TUCKER.**—We fear that no medicine taken internally will be of much benefit to you; the treatment will have to be local in character. Meanwhile, you should take cold baths, plenty of active outdoor exercise, and eat plenty of good food. Do not indulge too frequently, once a week is quite sufficient. Should you not improve within a week or so, you had better write again enclosing a stamped addressed envelope, as the nature of the subject prevents more detailed discussion in these columns.

**BATH COTTAGE.**—1. We are inclined to think that the iron preparations you mention will not do you much good. The treatment requires to be dietetic rather than medicinal. You should abstain from all beer and wines, also from much meat, sweets, confectionery, pastry, &c. Fish, underdone meat in moderation, boiled fowl, and plenty of green vegetables are suitable. You should take plenty of active outdoor exercise, and drink St. Galmier, or Apollinaris, with your meals. Keep the bowels freely open by means of the following pill taken every night: Blue pill one grain, sulphate of quinine one grain, powdered rhubarb one grain, extract of hyoscyamus one grain. To make one pill. Next morning take a little Carlsbad water or other aperient salts. Take also the following medicine: Bicarbonate of potash two drachms, infusion of gentian to six ounces. One-sixth part three times a day between meals. 2. We should not recommend "Anti-Calcaire" for this purpose.

# FREE SAMPLES.

Those Ladies who have not had SOUTHALLS' "SANITARY TOWELS" brought under their notice, may obtain a free sample by applying to THE LADY MANAGER, 17, Bull Street, Birmingham, mentioning this paper.

**SOUTHALLS' "SANITARY TOWELS"—the greatest invention of the century for Woman's Comfort, at the cost of washing only.**

May be obtained from Ladies' Outfitters, Drapers, and Chemists throughout the world, in packets of one dozen. Size 1, 1s.; Size 2, 1s. 6d.; Sizes 3 and 4 (differing in shape), 2s.

ALSO POST FREE from THE LADY MANAGER for 1/3, 1/9, and 2/3.

**SOUTHALL BROS. & BARCLAY, BIRMINGHAM.**

WHOLESALE AGENTS—SHARP, PERRIN, and Co., 31, Old Change, London, E.C., and STAPLEY AND SMITH, London Wall, London, E.C.

# "MALT-COFFEE"

(PATENTED.)

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch.*

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Does not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much farther than any ordinary coffee therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin.

MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

**REFORM.**—1. You will need to cut down your consumption of tobacco to the smallest possible quantity, for you are suffering from naso-pharyngeal catarrh, which is always aggravated by smoke. Use three or four times each evening an inhalation containing half a drachm of tincture of benzoin to a pint of boiling water. Breathe the vapour through both nose and mouth until the water is too cool to give it off. 2. The part being uncovered is by no means to be regretted. No measure that you can adopt will prevent or alter the state of things, and as you will never succeed in "in doing so," we need not discuss the period of rest or return to civility. 3. No. It is no bar. On the contrary, it is frequently of the greatest possible advantage under the new conditions.

**JOHN JOHNSON.**—As you gave a wrong address our letter of advice was returned through the post.

**A POOR CLERK.**—The cause of your nocturnal trouble is doubtless the fact that you sleep on your back. You should prevent this by tying a large cotton reel in contact with your back by means of a piece of tape passed round the waist: when you turn on your back the pressure of this reel will wake you. You eat too much porridge and wholesome food, which irritate the stomach and cause flatulence. Eat boiled fish, lean mutton underdone, take a lightly-boiled egg for breakfast, with meat for your midday meal, and some bread and milk for supper; keep the bowels freely open by means of a little liquorice powder, and take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, chloroform water six ounces. One-sixth part three times a day immediately after meals.

**HOPEFUL.**—1. This is caused simply by the fact of your lying on your back when asleep. We should advise you to obtain a large cotton reel or other hard angular body, and tie it in contact with your back. If you should unconsciously turn on your back during sleep, you may rely upon the sharp angles waking you. 2. You may eat some boracic acid tincture from the chemist, and douche the part with it after thoroughly washing, but we are afraid that you will never really get rid of this unfortunate condition unless you cease perspiring.

**ELLEN FRANKLIN.**—Liver disturbance, with possible tendency to stone. We suggest your taking the following pill every day, with dinner: Pill of colocynth and henbane three grains, blue pill one grain. Also the following mixture twice a day between meals: Bicarbonate of potash fifteen grains, tincture of henbane thirty drops, infusion of buchu to half an ounce. Give up beer, sugar, and coffee. Eat your food slowly, and take a fair amount of outdoor exercise.

**M. H.**—Until the cause has ceased to operate, so long will the results make themselves evident. It is first necessary to secure the cessation of all bad habits, to keep the bowels acting (the following medicine will secure that), to wash the face only in hot water, using only good soap, such as vinolia or terebene, and to get the patient to walk from four to eight miles each day. The mixture to be taken before each meal: Dilute hydrochloric acid ten minims, sulphate of quinine one grain, tincture of nux vomica six minims, sulphate of magnesia one drachm, camphor water to half an ounce. It will be necessary to persevere with treatment for several months (with occasional rests).

**EXPERIMENTER.**—We should advise you to ask these questions of some neighbouring chemist, or of the "Pharmaceutical Journal." They do not come within the province of the physician.

**G. P.**—To make your hair grow thicker you should look after your general health. Be much out in the open air, and take cold baths every morning, eat plenty of good food, and keep the bowels freely open. No local application will be of much service if you neglect your bodily health, keep the bowels freely open also. To strengthen your voice, nothing is better than regular practice of scales under the eye of a good master, unless you know how to produce your voice properly, sing only as much as is actually necessary for practice to acquire proper production; avoid smoking and spirits, and indulgence in late hours or hot crowded rooms.

**JOSEPH WHITEHEAD.**—We are very much afraid nothing will be of any service in your case: the only thing you can do is to go back to the asylum, where you will get the best treatment possible.

**N. TURNER.**—We quite agree with your medical man that it is not wise for you to indulge in the too frequent use of these pills. You should be careful to avoid beer and wines, also all sweets, confectionery, and pastry. Keep the bowels freely open by means of the following pill taken every night, and followed the next morning by a mild dose of aperient fruit salts: Blue pill one grain, powdered rhubarb one grain, sulphate of quinine one grain, extract of hyoscyamus one grain, to make one pill. Get a hot bath once or twice a week at night, and take the following medicine: Sulphate of soda one drachm, bicarbonate of potash one drachm, infusion of gentian to six ounces: one-sixth part three times a day.

**NELLIE.**—We have very little doubt that what you really require is a holiday, or a few days rest. You should take a cold bath every morning, and have your meals quite regularly. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. You should try and get some regular exercise of a pleasurable nature, and not merely that obtained by presiding over the rotations of a machine wheel. Take a teaspoonful of ammoniated tincture of quinine three times a day.

## EASTON'S SYRUP.

WHENEVER this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Sold in 4-oz. bottles, 1s. 6d.; 8-oz. bottles, 2s. 6d. 16-oz. bottles, 4s. 6d.

## EYESIGHT PRESERVED.

MR. AITCHISON, Oculist Optician, should be consulted in all cases of Defective Vision 47, FLEET STREET, LONDON, E.C.

**FREEMAN'S ORIGINAL CHLORODYNE.**

Sold by all Chemists and Patent Medicine Dealers in all parts of the World.

This important and valuable Medicine discovered and invented by Mr. Richard Freeman in 1844, introduced into India and Egypt and all over the World in 1850, maintains its supremacy as a specific remedy for the treatment and cure of Coughs, Colds, Consumption, Bronchitis, Asthma, Ague, Sore Throat, Influenza, Neuralgia, Diarrhoea, Dysentery, Asiatic Cholera, Colic, Gout, and all Fevers, &c. &c. 2s. 6d., 4s. 6d., 11s., 20s. per bottle, post free. N.B.—Lord Chancellor Selborne, Lord Justice James, Lord Justice Mellish, decided in favour of FREEMAN'S ORIGINAL CHLORODYNE and against Brown and Davenport, compelling them to pay all expenses in the case. *Sunday Times*, July 24, 1883. Reject substitutes.

**CHAS. DICKENS.**—If you have been perfectly free from any signs of disease for a period of twelve months after stopping all treatment, you will be perfectly safe in marrying, but otherwise you should see some specialist and undergo a short course of treatment before doing so.

**A. H. K.**—The ulceration would probably be caused in consequence of the displacement, and the displacement would be the result of getting up too early after your confinement. If you are feeling pretty well in yourself, we should advise you to have an instrument introduced, so that you can get along comfortably and take exercise. It would be altogether better though for you to take the advice of the surgeon who has already treated you.

**INMAN.**—No doubt you have sprained your back in some way, and the effects, in spite of all treatment, will probably not disappear for some little time. In the meanwhile the best you can do is to rub and pinch the skin of the part well with some embrocation or ordinary sweet oil. Jadicions, but not absolute, rest is advisable, and be careful to keep the bowels freely open.

**F. MC.**—You may use the prescription we gave you in our reply to you. We do not think it is very likely that you should re-infect yourself in the way you suggest. With regard to the warts, they are a result of the discharge from your not being sufficiently clean. Be careful to wash regularly twice a day and dry thoroughly. Use equal parts of powdered oxide of zinc and calomel, well powdered together, to dust over the warts. They will disappear in time. You should keep on the medicine for some little time after the discharge has stopped. If it does not stop altogether, there may be some slight stricture which is keeping it up.

**R. H. C.**—These bi-palatinoids may be obtained at Oppenheimer and Son, 14 Worship Street, London, E.C. We are surprised that the chemists in your part of the country are not acquainted with these drugs.

**SARAH L.**—If the mechanical method we suggested to you does not prevent your lying on your back, then you must obtain something larger, like a large angular flint-stone. It is only a question of getting something large enough. If you wish to stop all this spitting of phlegm, you must refrain from smoking and drinking. Unless you discontinue these habits all the physic and advice in the world will be absolutely useless.

**W. E. YARROW.**—We should recommend you to try the effect of a few drops of warm oil, placed in the ear each night at bedtime, and kept in position by a plug of cotton wool. After three or four days of this, get some careful friend to syringe your ear with some warm water, in which a little soap is dissolved, taking care not to empty and have patience that the opening of the ear passage is not blocked by the nozzle of the syringe. After drying, place a fresh plug of cotton wool in the ear.

**BRIGHTON.**—You must persist in taking the capsules for at least another four weeks. Drink no beer, keep the bowels free with a daily dose of some simple saline aperient—effervescent effluvia of magnesia will do—and have patience.

**IRISMAE WOMAN.**—You have indigestion with liver disturbances, and we should advise not to take any more of the iron medicine for the present. Instead of that try the following: Nitrate of potash ten grains, sulphate of soda one drachm, infusion of buchu to half an ounce. Give up the baths, take more exercise, and certainly do not attempt sea-bathing. It is possible that a change, inland, may help you.

**XXX.**—We are afraid we cannot arrive at a very definite conclusion as to whether the giddiness you suffer from is due to the blow on the head, or merely to your having previously indulged in drinking habits, and are now experiencing their effects. You should be careful to keep the bowels freely open, let your meals consist of light nutritious food, such as boiled fish, lean mutton &c., and take the following mixture: Dilute nitro-hydrochloric acid one drachm, sulphate of quinine six grains, bromide of potassium one drachm, chloroform water to six ounces. One-sixth part three times a day between meals.

**HENRY NELSON.**—You should avoid all beer, wines and spirits, and much standing or walking about. Take the following medicine: oil of sandalwood two drachms, mucilage of gum acacia four drachms, pancreation ten grains, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals. You had better also use a well-fitting suspensory bandage to thoroughly support the parts.

**POSTMAN.**—If you are fully conversant with the diet a dyspeptic should have, you know more about the matter than we do. You should take plenty of active outdoor exercise, and keep the bowels freely open. Take a cold bath every morning. Avoid beer, wines, and spirits, and take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day immediately after meals. If you do not improve you had better write again, telling us what your diet is.

**F. FULLER.**—Please let us know your age, sex, habits, occupation, diet, and symptoms. It is not enough to say that you are suffering from "arrows" and general weakness." That means nothing to a medical man, and we prefer not to guess at a diagnosis. If you will send the particulars named, we shall be happy to advise you.

**A READER.**—We think you ought to take some outdoor active exercise, but not cycling; much better jump, box, play lawn-tennis, football, or cricket. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts, take also the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day immediately after meals.

**JOHN BLACK.**—You are suffering from catarrh of the mucous membrane of the alimentary tract. You are therefore not able to digest your food, nor are you in a state to derive any benefit from tonic medicines. You must restrict your diet to the most easily digested foods, avoiding coffee, sugar, tobacco, and all stimulants. Eat your food slowly, and drink only after the termination of each meal. Take daily with dinner a pill containing: blue pill one grain, pill of colocynth and henbane three grains; and before each meal the following mixture: Subnitrate of bismuth ten grains, mucilage half a drachm, mixture of nux vomica six drops, camphor water to half an ounce.

**JOHN CONDOR.**—1. Yes. 2. Probably. 3. The "tonic pills" so-called are improperly prescribed. The dose of sulphate of quinine is much too large. 4. Yes, it is the same article, and is not likely to hurt the teeth. 5. The ointment is a very powerful and dangerous preparation, which should be employed under daily medical supervision. Even then, unless ordered by a really good specialist, we should hesitate to use it for ourselves.

**CONCERNED.**—We do not think you have neuralgia of the cord. Such a condition is rarely if ever found, and your symptoms do not point to such a possibility. We are inclined to think there must be some physical or pathological reason for the trouble, and that you would do well to place yourself in the hands of some competent specialist in such matters. The poultice would do you no good under these circumstances. The belladonna would be merely palliative. If you wish further advice, please describe the symptoms more fully.

**JOHN.**—We should not recommend the use of the drug unless we were perfectly aware of its action and uses. Its action in no way resembles chloral, which is a hypnotic.

**ELIZABETH.**—1. You are evidently suffering from nervous debility, but we cannot say anything definite with regard to the sterility you complain of, as there is no absolute evidence to prove it. We certainly think that electricity scientifically applied would be highly beneficial to you, but it would be necessary to remain under treatment for some considerable time. We do not think drugs would be of much benefit to you.

**HOPELESS.**—The best thing you can do to ascertain whether you really are suffering from heart disease or not, is to go and see a well qualified medical man. A pulse of seventy is about the usual rate at your time of life, but much depends upon the character of the beat, as to its regularity, compressibility, force, &c. Anyhow, you cannot do better than see a medical man.

**ANXIOUS ONE.**—1. With regard to this matter, you had better consult a good dentist, and obtain his advice on the question. 2. We are unable to tell you what this is without an examination, but if it does not cause you any particular inconvenience, we should advise you to leave it alone, lest continued meddling do more harm than good.

**M. F. C.**—1. Boracic acid one drachm, chloride of potash one drachm, tincture of eardamons one drachm, glycerine three drachms; rose water to six ounces—to make a wash for the mouth. 2. There is no article of food that particularly assists the growth of hair. You must look well after your general health, take cold morning baths, get plenty of active outdoor exercise, and keep the bowels freely open. Eat good solid nutritious food, and refrain from all debilitating habits, such as sitting up late, or excessive indulgence in smoking or drinking. Take a teaspoonful of Parri's Food three times a day immediately after meals. 3. No, we have not.

**C. H. H.**—Take the pill and medicine suggested to "Ellen Franklin." Continue your present dietary, and take as much outdoor exercise as may be convenient. Report in a month's time, and we will advise you what further treatment may be needed.

**DOROTHY.**—This condition of the foot may have been originally produced by wearing badly-fitting boots or too high heels. With regard to treatment, we think the best results would be caused by massage and electrical applications. But without knowing more about the exact conditions, we are unable to advise satisfactorily. Walking under present conditions is certainly the worst thing possible, only tending to exaggerate the deformity.

**FOLLY.**—See reply to "H. Roberts," and take the medicines prescribed for him. Take also a teaspoonful of sulphate of magnesia each morning in a wineglassful of water. You must learn to pass a gum-elastic catheter (No. 9 English) twice a week, retaining it in position for at least two minutes each time—the chemist will tell you how far and in what manner to use this.

**D. D. A.**—Yours is a mixed case, but the history points chiefly in the direction of gonorrhoeal rheumatism. Persevere both with the mixture and with the quinine pills, and wrap the swollen joints with flannel or woollen material. Should the troubles still persist after a week or ten days, add five or eight grains of iodide of potassium to each dose of the mixture. Please report again in two weeks.

**COOK.**—Give up all the medicines and injections named—you have used a great deal, and many of them, but the result has been to upset your internal economy pretty completely. Instead of them all, take every morning before rising two teaspoonfuls of the following powder, dissolved in a wineglassful of hot water: Sulphate of magnesia and sulphate of soda, of each two ounces. To be powdered and mixed. Let us know the result in a few weeks, but let the report be a little shorter, please.

**CHARLES NORTH.**—As you have already consulted a fairly well-known provincial physician, it would be rash on our part to offer a diagnosis without examination. You had better make up your mind to come to London for the opinion of one or more specialists, whose name we shall be happy to give if you send us a stamped addressed envelope with request for the same.

**PART II.**

DIAGRAM OF BRAIN.—Dark lines indicate Fissures.

I.F. FIRST FRONTAL CONVOL.  
2.F. SECOND .. ..  
3.F. THIRD .. ..  
F.Sy. FISS. of SYLVIVS.  
FR. .. ROLANDO.  
I.T. FIRST TEMPORAL CONVOL.

Diagram showing the position of the Convolutions and Fissure to the Skull.

HOW have the functions of the brain been discovered? Principally by watching the effects of disease during life—of which I will give a remarkable instance presently—and then carefully searching the brain by the eye and the microscope after death for disease, a slow but sure process. Secondly, by noting the effects of injury to localised portions of the brain. Thirdly, by experiments carried out on monkeys and other animals and noting the results, and *then* comparing these results with those known to occur in disease and accident in man. The method is to stimulate a portion of the brain with an electric current; this, of course, only giving motor results.

The peculiar disease I have just mentioned goes by the name of bulbar-paralysis, first described in 1841 by Trousseau in a well-marked case occurring in the Prince de la Moskowa. The speech is affected—the vowels and consonants that are difficult to utter vary with the part first affected—swallowing is gradually increasingly difficult, the food lodges in the cheeks, saliva keeps running from the mouth. Altogether the patient presents a most curious appearance; the upper part of the face is all human, the eyes move with intelligence, but the lower is paralysed, and gives no sign of animation. The higher cerebral functions are undisturbed, the patient sleeps well, and his intelligence and memory are perfect.

Now, when the brain is examined after death, all that is found wrong is that there is a slight discolouration of the floor of the fourth ventricle,

and its texture, when cut into, is blurred, and when a portion of this part of the brain is examined microscopically the multipolar cells are found to have undergone degenerative changes. Now, it is obvious that this portion of the brain must have some relation to speech, mastication, and swallowing, and so medical men have gradually built up a large mass of knowledge of the functions of the brain.

The functions of the medulla and pons are to carry on such things as we do automatically—that is, without “thinking.” You seldom, when eating your dinner, give a thought as to the manner in which you will swallow the morsel after it is in the mouth; if you don’t, the centre in the medulla carries it out for you, but you can call the highest centre in the cortex into play if you choose and decide how and when you will swallow that morsel. I hope I have made clear this very important function of the medulla and pons. The cerebellum, or little brain, has nothing to do with reason or volition, and has nothing on earth in common with the reproductive function. If you deprive an animal of its cerebellum, it moves above as if drunk. The *cerebellum co-ordinates the movements* of the body—that is, when you have learnt to walk the cerebellum puts the movements in order for you without your knowledge. Disease of this portion of the brain bears out amply the experiments on animals. The central ganglia of the brain, about which I said so little in the description on account of their complicated relations, are devoted to functions of the same nature as the pons and medulla,

Now we come to the hemispheres. the grey matter of the convolutions, which is the seat of all new thought and movement, in which rests the "I," the man himself; in which must rest the soul, if you admit the existence of one, for take away the grey matter of the cortex and you take away all power of fresh thought and movement, and the man becomes an automaton. He could exist, eat, and live if food was put in his mouth, he would swallow and digest it, his breathing would continue, and so would his heart beat, but he *could not think*.

The different parts of the convolutions are devoted to different functions, but our enquiries are by no means complete, and especially is this true of sensory functions. The motor are pretty well complete, and the reason for this must be obvious—motor movements are so much easier to trace than "thought." Now for a curious discovery. We are *left-brained* as well as right-handed, but this is because the paths from the brain to the nerves cross before leaving the brain. We train one side of our brain only. If an accident or disease were to attack the lower part of the third left frontal convolution there is one inevitable result, you could not *express your thoughts*, you might be able to speak but you could not appreciate your words, you would be able to see written words but not able to understand them. Near this centre, if disease occurs, your power of language would be lost. This is most conclusive. Here is a case. A youngster, said to have been very talkative before falling out of a window, injured his head on the left side. The wound healed, the boy was dumb, but otherwise intelligent. He was drowned about twelve months afterwards, and it was found the injury had destroyed the third left frontal convolution. Many other instances could be given.

The temporal lobes are the centres of sensory perceptions, and one portion is devoted to hearing, as in the chart. In animals if this part is electrified, the animal pricks its ears and assumes the expression of hearing—disease in man corroborates these results.

The centres of smell, taste, touch, pain, and sight are also situated here, *on both sides of the brain*—the left serving for the right side of the body and the right for the left side of the body.

The only thing that can be said with certainty about the occipital lobes is that they probably preside over the digestive apparatus, and perhaps reproduction.

The anterior lobes are psychologically the most interesting. Electrical stimulation of them produces no result in animals, and the most fearful injuries have occurred in men with ultimate recovery, with only one result—there has been no paralysis, only an *alteration in the character*. Generally the individual loses his work through his bad behaviour. Animals in which the frontal lobes have been removed were altered in their characters from that previous to the operation. Instead of prying about and exhibiting the dumb intelligence that is so expressive in a monkey, they are listless and take no notice of what is going on around them.

This, then, shortly is a summary of what is absolutely known about the functions of the brain as regards the "intellect," but in the space called the motor area, or that part of the cortex in which lesions cause paralysis on the opposite side of the body lies beneath the anterior half of the parietal bone. It is about a parallelogram an inch wide traversed obliquely by the fissure of Rolando.

Disease of the upper end of this motor area causes paralysis of the opposite lower limb; disease of the middle, paralysis of the arm; and the lower part, paralysis the face. To find the motor area on the skull, draw a line vertically upwards in front of the ear to meet a line drawn from the root of the nose to the occipital protuberance, and another at the back of the ear parallel to the first line, and the upper three-quarters will map out fairly well the motor area. These motor centres are so well known that a surgeon will proceed to operate many times with brilliant success, judging only of the seat of disease from paralysis of some portion of the body. When our knowledge has grown and extended, we may be able to present

a true "phrenology," not the nonsense taught by "professors" trading on the *amplified* knowledge of Gall, whose writings contained a sprinkling of truth, which impressed them for a time with a fictitious value, until modern science stepped in and brushed the cobwebs away with the dawn of our new and exacter knowledge.

### EDITORIALS.

**HOW TO TAKE MEDICINE.**—The most pleasant way possible to take medicine is to eat an abundance of delicious, ripe, juicy fruits and vegetables. These are all changed by cooking. Berries should be put into granite or earthen dishes, with a small quantity of sugar sprinkled on top. Set over a slow fire. When the sugar is melted, and the fruit cleverly heated through, it is ready to be taken off the fire and set to cool. In this way we get the advantage of the beautiful colour of the juice and the natural taste of the fruit. Roots should be put into boiling water, while peas and beans should be put to cook in cold water. All vegetables should be cooked until tender, then serve at once while hot. By a diet largely vegetable and fruit, we feed our bodies with mineral acids and salts of the earth, which are palatable to taste and agreeable to the eye, thereby protecting our more esthetic senses from the thought, sight, or taste of medicine.

**DO BABIES' EYES GROW?**—How big are "a young baby's eyes"? We have heard it stated that "a young baby's eye" is as big as a grown person's eye; that the eye does not grow as the body grows, that it is the same size when the baby is born as it is after the baby has grown up to be a man or woman; that it is born full size—is then as big as it ever gets to be. This statement has been submitted to a number of experts on babies, who generally agree that "a young baby's eye" grows as the body grows, though not in the same ratio. But is it true? Authorities are sometimes in error. Expert witnesses frequently tangle themselves up in all kinds of contradictory statements of facts; expert physicians do not reach the same conclusions from identically the same basis of reasoning. It may be that the baby experts whom we have questioned upon the subject of

baby eyes have spoken without due consideration. We should like to have the puzzle settled. Do babies' eyes grow? How big is "a young baby's eye"?

**BREAD AND DYSPEPSIA.**—The conclusion that wheat bread is unfit for dyspeptics, sometimes jumped at because ill effects are noticed to follow its use, is erroneous. On the contrary it has been pointed out by Bouchard and others that farinaceous food is peculiarly adapted to some dyspeptic patients. It is the microbes in the starch, which is capable of producing irritating acids, that cause the trouble. To avoid this, Bouchard recommends that only the crust or toasted crumbs of the bread be used by dyspeptics, particularly those whose stomachs are dilated. The reason of this is explained by the fact that baking temporarily, though not permanently, arrests the fermentation of dough. When it is again heated by the warmth of the stomach the fermentation is renewed. In cases where the bread is toasted brown through, the fermentation is stopped permanently.

**WET FEET AND COLDS.**—Dr. Brown-Sequard recommends the following as the best way to overcome susceptibility to taking cold from getting the feet wet. Dip the feet in cold water, and let them remain there a few seconds. The next morning dip them in again, letting them remain in a few seconds longer; the next morning keep them in a little longer yet, and continue this till you can leave them in half an hour without taking cold. In this way a person can become accustomed to the cold water, and he will not take cold from this cause. But be it thoroughly understood that the "hardening" must be done carefully.

**BURNS.**—Children very often suffer from burns, bruises, cuts, and blisters. Many times a good salve is needed in the nursery or for the school children; but there is none at hand, and much suffering results from neglect to heal sore places quickly. A good salve is prepared by melting together an ounce of beeswax and an ounce of sweet oil. Allow it to become almost cool, then add an ounce of spirits of turpentine, and mix well together.

**THE MOUTH AS A CATCH-ALL.**—There are a multitude of people who, in addition to the natural and proper uses of the mouth, seem to regard it as a sort of handy receptacle, into which any small object may be thrust for safe keeping till wanted. This trait is not confined to either sex, or to any age. Many a fond mother will cry out in alarm at the sight of her child running about with a plaything in its mouth, yet the chances are that if this same mother should an hour later have occasion to pay her fare on a public conveyance, she would fish out, from a purse a small coin, which she would hold between her lips till ready to make some other disposition of it—and this regardless of the fact that on an average the coin had been travelling about the country for from fifteen to twenty years, during which time it had been in all sorts of places and amid all kinds of surroundings. This observation is true of many other things than small coins, and of fathers as well as of mothers. Some of the most painful instances possible have recently illustrated the danger of this habit. The horrible death of a well-beloved clergyman, the result of swallowing a small cork which he was holding between his lips, is fresh in mind; and the present time of writing a man has his lungs filled with tacks which he swallowed in a similar manner. He was holding them between his lips, while putting down a carpet, and inhaled them in laughing at the remark of someone present. He now lies at the point of death, and no earthly power can aid him. Surely these illustrations and the suggestions which they invariably call up, ought to be sufficient reason why no thinking person should ever make a temporary receptacle of the mouth for foreign substances.

**TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES** quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 1½d. and 2s. 6d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, E. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

**BIRDS** of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

"The FAMILY DOCTOR, a Practical Household Periodical, useful and interesting."—*Globe*.

**COFFEE AS A DISINFECTANT.**—The use of coffee as a disinfectant is generally known, but it is doubtful if the majority of people are aware of its true value in this direction. They probably know that it is handy and harmless; but besides these qualities it is really one of the most powerful and effective agents known, as has been shown by repeated experiments. In one case a quantity of meat was placed in a close room and allowed to decompose. A chafing dish was then introduced and 500 grammes of coffee were thrown on the fire. In a few minutes the room had been entirely disinfected. In another room, the fumes of sulphureted hydrogen and ammonia were developed, and the smell—which no words can express—was destroyed in half a minute by the use of ninety grammes of coffee. As a proof that the noxious smells are really decomposed, and not merely overpowered by the fumes of coffee, it is stated that the first vapours of the coffee are not smelled at all, and are therefore chemically absorbed, while the other smells gradually diminish as the fumigation continues. The merest “pinch” of coffee is usually sufficient to cleanse a sick-room, even in aggravated cases. The best way to employ it is to freshly pound the coffee in a mortar, if no mill is at hand, and sprinkle it on a red-hot iron surface.

**A GOOD EXERCISE FOR THE BACK.**—A good exercise for the spinal muscles consists of the following movements: Stand erect with the feet together and rise upon the toes, then gradually sink down by bending the knees until the thigh and calf are doubled upon each other. The trunk should be erect all the time and especial attention paid to the spine, keeping it straight. If a person will remove the clothing and hang by the arms, all tension is removed from the spine and a second person can determine if the spinal curvature can be removed or not. If, when hanging in this position, the spine is straight, there is no reason why it cannot be cured, but if it is crooked when hanging, there is little hope of doing more than keeping it from growing worse, and this is very important. In the department of medicogymnastics in a large gymnasium, this is the way they examine such cases. A teacher says: “Any movements which do not present any outside resisting force (meaning apparatus) can be safely taken to benefit slight spinal curvature.”

\* \* \* \* \*

**HUMAN COMPREHENSION.**—The capacity of human comprehension is not a little tasked at the conclusion arrived at by scientists, who, it now appears, have succeeded in measuring the thickness of the envelope of soapy water inclosing the air of the bubble when it has become so thin as to produce rainbow tints. Thus, when showing the shade of violet, it was one-fourth the thickness of the length of an ordinary violet wave of light—1-60,000 of an inch—a thickness, that is, equal to 1-240,000 of an inch. As the bubble continued to expand, a black patch was found to be only one-fortieth of that of the violet section, or just about 1-10,000,000 of an inch.

\* \* \* \* \*

**LIGHT CREATES SOUND.**—One of the most wonderful discoveries in science that has been made within the last year or two is the fact that a beam of light produces sound. According to Milling, a beam of sunlight is thrown through a lens on a glass vessel that contains lamp black, coloured silk or worsted, or other substances. A disk, having slits or openings cut in it, is made to revolve swiftly in this beam of light so as to cut it up, thus making alternate flashes of light and shadow. On putting the ear to the glass vessel strange sounds are heard so long as the flashing beam is falling on the vessel. Recently a more wonderful discovery has been made. A beam of sunlight is caused to pass through a prism, so as to produce what is called the solar spectrum or rainbow. The disk is turned and the coloured light of the rainbow is made to break through it. Now

place the ear to the vessel containing the silk, wool, or other material. As the coloured lights of the spectrum fall upon it, sounds will be given by parts of the spectrum and there will be silence in other parts. For instance, if the vessel contains red worsted, and the green light flashes upon it, loud sounds will be given. Only feeble sounds will be heard if the red and blue parts of the rainbow fall upon the vessel, and other colours make no sound at all. Green silk gives sound best in red light. Every kind of material gives more or less sound in different colours, and utters no sound in others.

## WAITING FOR THE PHYSICIAN.

“WHAT shall we do while waiting for the physician?” is a question of no little moment, from the fact that something necessarily should be done, and too often, on account of a lack of knowledge, the wrong thing is done. Some may think that the only thing that can be done is to fold the hands and wait, while the patient perchance may be suffering. However, there are many things which may be done that will be a great source of comfort to the patient during the tedious hour or hours of expectancy. Whatever is done will be shaped, of course, by the condition of the sufferer, and the length of time elapsing before the physician arrives.

While the prospects may be small for us to do the patient a great deal of good, we should be exceedingly careful not to do the patient harm. Consequently, no matter how exciting the circumstances may be, we should have cool heads, calm nerves, and try as far as possible to comprehend the conditions of the patient, in the light, at least, of a few cardinal points, namely:—

First, in all sudden attacks it is safe to say that there will be more or less disturbance of the circulation, perhaps a congestion of some of the internal organs, and a consequent lack of blood on the surface, which, if marked, will produce a chill, and a chill is nothing but a common-sense way of exciting the system to action, in the hopes of equalising the circulation. Then, in case of a chill it is always rational to do those things that will bring the blood to the surface of the body, which would call for hot applications, mustard draughts, or rubbing.

Second, any lack of bowel action should be met with a mild laxative or enema of water. The latter as a rule will give relief.

Third, any pain should be palliated by hot applications or poultices. Hot fomentations may be given *ad lib.* By this we do not mean a towel or napkin wrung out of boiling hot water, but a flannel compress, comprising five or six thicknesses, folded oblong and wrung out of boiling hot water, and applied vigorously over the seat of the pain until the body is aglow with the blood brought to the surface. It is always safe to administer fomentations in case of pain, often for an hour at a time.

In case of fever, there is much that can be done while waiting for the physician. As a fever indicates heat, then it would be but reasonable to apply cool water. If gratefully received, this can be applied vigorously in the form of light compresses to the head with occasional spongings of the body, which is best accomplished by moistening the hand in cold water, and with the palm of the hand gently moistening the skin. Instead of wiping the surface dry, leave the moisture to evaporate, as this is one of the most efficacious and agreeable ways of applying cold to the surface of the body. The feet should be kept warm, using hot-water bottles, jugs, or hot cloths. If the temperature is high, it will be perfectly safe to allow the patient to drink cold water or take into the mouth small pellets of ice, which will be very gratefully received.

The covering should be light in case of fever, amounting to a sheet or spread only, and the patient should have plenty of pure air. In the majority of fevers this may be all that will be necessary to be done while waiting for the physician to take charge of the case.

If, in connection with the fever, or without the fever, there is a good deal of intestinal disturbance—which often occurs in the onset of many troubles, such as nausea, and perhaps

vomiting, with diarrhoea—there are many things which can be done to very good advantage to relieve this condition, which need not in any way interfere with anything that the physician may do. If there is continual nausea with vomiting, it will often prove a very grateful measure to administer as much warm water as the individual can be made to take, not only for the sake of washing out the contents of the stomach, but a special advantage will be gained, inasmuch as there will not be so much straining, the stomach having sufficient fluid to act upon. After the stomach has been thoroughly emptied, little pellets of ice may be administered, with the hope of relieving the nausea.

If there is pain in the stomach, with nausea and vomiting, mustard draughts may be placed over the pit of the stomach, which will often aid in relieving the nausea. If there is pain in the bowels, perhaps cramping, with diarrhoea, much can be done to relieve that condition. Foremost, as we have before mentioned, application of fomentations to the bowels will usually give a good deal of relief. That connected with copious hot enemata, as hot as the individual will be able to bear, will usually check the severity of the attack, and render the case much more easy for the physician to manage.

It would be quite impossible to do any harm to the case if the foregoing suggestions were carried out while waiting for the physician, and in the majority of cases, in the course of two or three hours, it will be quite apparent that it was not necessary to call the doctor at all.

## THE “CYCLE-STOOP.”

THE use of the bicycle as a means of locomotion, and as an agent for pleasant pastime, has introduced a new cause in the production of spinal curvature. When the wheel first came into use, the handles were long and the rider could sit upright. The disciples of physical culture saw in it a new instrument for health. The desire for increased speed and record breaking made it necessary to lessen the diameter of the wheel and shorten the handles, so that now you may see on any fine day whole troops of cyclists spinning along with their backs arched over the lever, and as they must see where they are going, the chin is raised, and the back of the head approaches the shoulder blades. Thus a double antero-posterior curvature has its foundation laid; constant humping the back could do no less.

If the rider's ambition was grace, dignity, and beauty of carriage, instead of speed, much higher aims, there would be no need for this.

We do not wish to convey the idea that cycling should be abolished, for when rightly used it is a very exhilarating exercise; on the contrary, it should be encouraged, but cyclists should first of all things sit upright like men, and not double up like hunchbacks or professional contortionists. In the latest patterns of bicycles we see wherein true scientific culture has been made to give way to the demands of the professionals. The amateur should be encouraged, for he rides for health and pleasure; while the professional rides for the money he can win by it. It was professionalism that ruined the Greek gymnasium, and professionalism is now converting a healthful and valuable exercise into a dangerous diversion. Plato advocated graceful exercises which tend to perfect man's physical system for the Greeks, and spoke unfavourably of those exercises which were used by wrestlers, and if he were with us to-day he would condemn cycling as practiced by a majority of its devotees as not only ungraceful, but injurious.

A DAY AT “APPY AMPSTEAD” is thoroughly enjoyed by the East End poor, as is amply proved by the immense crowds who flock there every Bank Holiday. The pure air and bracing atmosphere to be found on the breezy heights of Highgate and its neighbourhood cannot fail to benefit those who can only spend a few hours in their midst. Holidays, however, cannot be fully enjoyed by those persons who are suffering from disease. Holloway's Pills and Ointment can speedily remove this drawback to pleasure if a fair trial is only afforded them. As a cure for rheumatism, gout, fever, diarrhoea, diseases of the skin, scrofula, ulcers, sores, burns, or old wounds, they are beyond competition.

**TIGHT LACERS.**—Ladies and Gentlemen's Corsets Fitted Personal visit not necessary. Self-measurement form free by post. Satisfaction guaranteed. Best qualities. Lowest prices. Close fits for Professionals. Neatness, comfort, health. **FORD AND PARR,** 141, Stockwell Road, London, S.W. Estab. 1856.

## MUSCLE MEASUREMENT.

THESE wonderful bodies that we call our own cannot fail to be an interesting study to anyone who takes the pains to carefully study them. If we examine them with any degree of care we will be well repaid for the trouble both in interest and in the knowledge of ourselves which may give us health at some future day. Dr. Sargent, the director of the Howard College Gymnasium, has made the human body his life study and probably knows more to-day about its measurements and proportions than any other man.

From careful measurement of 7000 students, young men and women, he furnishes the following table, giving the principal average measurements of both sexes:

## MAN.

Height, 5 feet 8 inches.  
Weight, 139 lbs.  
Capacity of lungs, 240 cubic inches.  
Waist, 29 inches.  
Head circumference, 22 inches.

## WOMAN

Height, 5 feet 3 inches.  
Weight, 115 lbs.  
Capacity of lungs, 173 cubic inches.  
Waist, 24.5 inches.  
Head circumference, 21.7 inches.

Anyone can take his or her own measurement and learn whether he or she is up to the standard on these important points.

There are many other measurements in Prof. Sargent's system, but these are the most important ones which he uses on all the students in the great gymnasium at Cambridge, U.S.A. He takes the measurements when they enter the gymnasium and every three months thereafter, changing their exercise from time to time as the measurements show a need. He also keeps a chart for each student, showing the size and condition of his muscles when he enters and when he leaves.

## PATIENCE.

BE patient! Easy words to speak  
While plenty fills the cup of life,  
While health brings roses to the cheek,  
And far removed are care and strife.

Falling so glibly from the tongue  
Of those—I often think of this—  
Whom suffering has never wrung,  
Who scarcely know what patience is.

Be patient when the sufferer lies  
Prostrate beneath some fell disease,  
And longs, through torturing agonies,  
Only for one short hour of ease.

Be patient when the weary brain  
Is racked with thought and anxious care,  
And troubles in an endless train  
Seem almost more than it can bear.

To feel the torture of delay,  
The agony of hope deferred,  
To labour still from day to day,  
The prize unwon, the prayer unheard,

And still to hope and strive and wait  
The due reward of fortune's kiss—  
This is to almost conquer fate;  
This is to learn what patience is.

Despair not though the clouds are dark,  
And storm and danger veil the sky;  
Let faith and courage guide thy bark;  
The storm will pass; the port is nigh.

Be patient, and the tide will turn;  
Shadows will flee before the sun;  
These are the hopes that live and burn,  
To light us till our work is done.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 9d., and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 33 or 132 stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

## THE BATH:

ITS RELATIONS TO HEALTH, BEAUTY,  
STRENGTH, AND COMFORT.

By I. G., M.D.

HEALTH and happiness, with their accompaniments of strength and beauty, depend to a large extent upon the condition of the skin—that important outer wrapper, so to speak, in which is inclosed all the complicated machinery of life and action. The question of bathing, therefore, becomes one relating to more than mere bodily cleanliness, important as is that factor in and of itself. A recent writer has shown four objects to be attained by the use of the bath, each conducive to the physical and mental welfare. These comprise the quickening of the nervous action, by which means a more brisk circulation of the blood near the surface is promoted, with more perfect reconstruction of the tissues and the elimination of all effete matter; a regulation of the temperature of the body, lowering it when heated beyond the healthful point, and raising it when abnormally low; the cleansing of the skin, and the excitation of pleasurable sensations, pervading the entire system with a gentle exhilaration. To these may be added still another, when the bathing is accompanied by swimming, one of the most beneficial forms of general exercise, calling into play, as it does, almost every important muscle of the body.

A momentary consideration of hygienic principles will show how important it is that in all general bathing the entire system should receive practically equal treatment. If we suppose the bath to be taken in open water, a considerable degree cooler than the temperature of the body, we find that on immersion the small nerves running beside the blood vessels near the surface of the system, and governing their action, shrink from the change, and force the blood from the surface toward the internal organs. This causes the pallor of the flesh noticed at such times, and carried too far, the "blueness" attendant upon excessive bathing. Now, if only a portion of the frame is exposed to the cooling action, the blood from that portion only will be repelled, while there will be an undue tendency in other directions; if the bather simply wades into the water till the legs and lower portion of the body are submerged, he cools or chills those portions, while he invites or necessitates an undue pressure of the blood in the upper part of the body and the head. It needs no argument to show the danger of such a course, especially to a full-blooded person, who is liable to suffer from a too heavy pressure of the blood, rather than otherwise. It is to avoid this derangement and danger that the habitual bather, though often unwittingly, begins the exercise by plunging head first into the water, after which the forces of nature have much less difficulty in keeping an even balance of their vital powers. While these suggestions apply especially to the swimming bath, they indicate corresponding treatment when the ablution is performed on a more modest scale; and save when bathing the hands and face alone, pains should be taken to treat the whole person, preferably beginning at the head, neck, and shoulders.

The above considerations will show that the bathing of weak persons, and especially puny children, must be done with great care and judgment, otherwise harm instead of good may result. A feeble constitution can never be strengthened by rough, hard usage. Every shock, every undue strain upon such a system is a drawing upon the already too slender reserve power, from which, if from any source, must come the vital energy which shall lead to better things and greater strength.

There is a theory among physicians, and it is probably pretty well founded, that regular and judicious bathing is to a considerable extent a preventative of colds, with their attendant annoyances. This is reasonable, on the ground that the pores are kept in a healthy state, and that the skin retains the power to protect itself from disease. It is even said that cool sponge baths, twice a week in winter and from four to six times weekly in summer, will cure the

catarrhal colds of children. These are to begin with warm water, near the temperature of the body, each succeeding bath to be a few degrees cooler—but of course the temperature must not be allowed to fall too low.

Where circumstances permit—which, unfortunately, is not always the case—there is no doubt that a morning bath is immensely valuable. In most cases this had best be a sponge bath, and in the summer weather presents few difficulties in almost any home. Water which has stood in the room during the night will have the proper temperature for a healthy person, and not more than five minutes need be taken if time is valuable. By the time the bath is completed and the skin has been gently but thoroughly rubbed, the entire surface will be in a glow, and the individual as soon as dressed will enjoy a brisk walk of any distance, up to a mile or two before breakfast. By this time the stomach has been incited to action, the "deck has been cleared," so to speak, the gastric juices are ready for their work, and the morning meal will find a generous appetite awaiting it. The resultant effects will be correspondingly noticeable, in health, strength, and beauty. This is the ideal way of beginning the day; where it is not feasible to practice it fully, partial observance will be found vastly beneficial.

The evening bath is not a substitute for that of the morning; its purpose and effects are quite different. There is the common ground of cleanliness, but apart from that, while the province of one is to invigorate the body for the labours and activities of the day, the other has rather the effect to calm and sooth, preparatory to the night's slumber. There can usually be no excuse for the omission of the evening bath. A few minutes can be taken from the time set apart for sleep, and will prove a good investment, no matter how limited the hours of rest may be. Besides, there are many, especially weary girls and women, who find themselves glad to seek the rest and comfort of the couch, forgetting in their weariness the stains of dust upon hands, faces, or arms; there are also those, it is a pity to say, whose faces have been heavily covered during the day and evening with cosmetics, traces at least of which still remain. In all cases of this kind the skin should be thoroughly cleansed before the person lies down to sleep, in order that it may at least have till some time the next forenoon in which to perform the functions for which a skin was created. If anyone will consider the natural office of the skin, with its wonderful powers and its complicated machinery for keeping the body healthful, it will not be asking too much that its clogged and blockaded shall for a part of the time have the privilege of carrying on its work of purification and rebuilding. Cosmetics, lotions, paints, and powders are bad enough at best; the sensible woman is coming more and more to avoid them; but that they should be allowed to carry on their destructive work both day and night is simply suicidal to health and beauty. The same may be said of dust, oil, or any foreign substance with which the skin may be burdened. Whether the bath shall or shall not proceed any further, always see that face, neck, hands, and arms are as clean as they can be, before going to sleep.

There is one special bath which may properly be spoken of at this time, as it is an evening application—an alum foot-bath for sore or tender feet. Many people are troubled by this affection of the feet, even with the best of care, and especially in hot weather. The best treatment which can be given is doubtless a very warm bath, with water in which one or two teaspoonfuls of alum have been dissolved. The feet should then be simply wiped dry, just before retiring.

The question of the hot or the cold bath, of how hot or how cold, is one that comes up very often for discussion, in connection with this subject of bathing. Now the warm bath, not to go so far as to say the hot bath, is very admirably adapted to most people if rightly used. But the trouble is in its abuse. There is a delightful sensation of what may be called happy nothingness in the warm water, and bathers forget that the tendency of this kind

KEATING'S POWDER.—Kills bugs, fleas, moths, beetles, and all insects (perfectly univalued). Harmless to everything but insects. Sold in Tins, 6d. and 1s.

WORMS IN CHILDREN.—Are easily, surely, and with perfect safety got rid of by using KEATING'S WORM TABLETS. Tin 1s. 10d. Free by post 13 stamps.

of bath is toward lassitude, weakening, and debilitation. It is by no means an unheard of thing that the action of the heart has grown weaker, till finally it has stopped entirely, and the bather has passed from languid consciousness to unconsciousness, and so to actual death in the bath. Doubtless this is a very easy and painless way in which to leave the world, but sensible people do not bathe in order to lose their lives, but that they may be prolonged and made more pleasant.

Really this matter depends largely upon the temperament of the person. For a stalwart six-footer, with heart and lungs like the interior department of a British ironclad, to dawdle with a warm bath seems decidedly incongruous, as it is; but while he may enjoy and defy a plunge into ice water, a single dip of a delicate woman into the same frigid flood would doubtless cost her life. It may, therefore, be said, as nearly as any hard and fast rule can be laid down in connection with the subject, that either extreme should be avoided, but that for the strong, robust person much more heat and much greater cold may be endured than in the case of one of weakened vitality or enfeebled heart action. If following the cold plunge there is a failure to promptly rally, and a sense of chill, or in the case of a warm immersion an undue feeling of lassitude, it shows unmistakably that the temperature has been carried too far, and that a modification should be made. What would suit one would quite seriously affect another; the wisest way, therefore, is to experiment carefully, and follow that course which experience shows to be the best and most invigorating.

Sea bathing has certain elements of tonic force which are absent in the use of fresh water; but these are really due to the saline qualities of the water. To a certain extent, therefore, the tonic effects of a sea bath may be secured at home by salting the water employed. Of course, the addition of sodium chloride does not quite give sea water, but it supplies the principal ingredient. In most places it is possible to obtain "sea salt" at the chemist's or grocer's and in this manner one may fancy at least that he is breasting the billows of the ocean, with all that the fancy implies. If a teaspoonful of the tincture of benzoin be added to the bath thus prepared, a delicious perfume will be secured. In using salt water, the rubbing and friction should be done before coming from the bath, immediately after which wipe dry and don appropriate raiment. It is scarcely necessary to remark that persons suffering from eruption of the skin, or having any abrasion, want to keep out of salt water.

While the matter of sea bathing is under discussion, it may be mentioned that in Ireland a seaweed bath is strongly commended as a cure for colds of the throat and chest. Half a dozen leaves of the common seaweed are put in a vessel, and two quarts of cold water poured over them. In twenty-four hours this will be quite brown in colour, and have quite a strong flavour of the sea. It is then ready for use, and is applied with a sponge, about the affected parts, after a bath in the usual manner to open the pores. It is said to be excellent if applied in a cold sponge at morning, for the relief of colds, coughs, and sore throat.

Scented baths are quite popular in certain circles, but not everyone can afford them. Some of them, however, can be prepared at slight expense. That by the use of benzoin has already been sufficiently suggested. Bath bags of crushed lavender flowers may be purchased for a few pence, and give a very satisfactory perfume. Dried violets may be used, a handful, more or less, being soaked in hot water for an hour. The scented water is added to the bath, and will be found to give a fine and lasting fragrance. Rose, lily, lilac, or heliotrope baths are prepared by adding the extracts or toilet waters of those perfumes; while lemon juice gives the lemon bath, aromatic vinegar or salts being an accessory to the Turkish bath.

The vapour bath is more strictly a medical accessory; but as it may sometimes be desirable to employ it when neither a physician nor a trained nurse can be at hand to oversee the operation, the following instructions will show the different methods of procedure: For a hot brick bath, set a red hot brick on end in a can, small bath, or other suitable vessel; place the latter under a chair, on the seat of which a

piece of flannel is spread. The patient, undressed, sits on this flannel, and he and the chair are well wrapped in blankets to exclude the air; his head is to be uncovered. Open the blankets a little at the bottom, and carefully pour about a pint of boiling water over the brick, and keep up the steam by occasionally repeating this. The patient remains in the bath until relieved by perspiration. To make a vapour bath in bed with hot wet bottles, fill about six oval-shaped, half-gallon stone bottles with boiling water; cork well, and fold each in hot wet flannel. Lay over the bed a waterproof sheet and a blanket; place the patient on these, cover him with a blanket, and distribute the hot bottles about him—one to each side, to the calf of each leg, and to the sole of each foot. Wrap up well with extra blankets, and tuck in to retain the heat. For the spirit lamp bath, place a damp towel over the seat and before the front of a cane-bottom chair, under which a spirit lamp is lighted and over the lamp a tin vessel with boiling water in it. The patient enveloped (except the head) in four or more blankets, sits on the chair until free perspiration occurs. With these instructions carefully followed, any intelligent person can administer a vapour bath, from which the patient should be immediately transferred to the bed, without exposure to the air, and warmly covered. A warm water bath should follow a little later, to remove the traces of perspiration, but care must be taken not to exhaust the patient.

## TYPHOID FEVER.

TYPHOID fever has long been known as a germ disease, the virus of which spreads rapidly in the hot, moist season of the year, by means of water, food, and air. Consequently, immunity from its attacks necessarily implies a strict surveillance of all the avenues through which it comes.

The epidemic of typhoid fever at Worthing is but another illustration of the wide range which the disease often attains when starting from a single source of infection. In this case the supposed source of infection was milk coming from a certain quarter. Whichever way the case may be, the primary cause is undoubtedly infected water, rendered so very likely from some typhoid case, and was received into the milk through the creature or otherwise. It may be needless to say it is usually otherwise.

We speak of this simply to emphasise the thought that the water should be carefully examined, with the following points in view:—First, with a soft soil the water supply should not be within 500 feet of the privy, cesspool, vault, or barnyard. Standing water might always be considered suspicious, as it will readily absorb various gases and germs. Water coming from far below the surface or springing from the mountain side is probably least likely to be laden with the germs of disease. If the supply is questionable, we would recommend a thorough boiling, and in addition the use of a filter when practicable. There is much less danger in imbibing the typhoid germs in food and air than in water. However, if every precaution is taken to insure pure food and air as well as water, the bettered conditions of the home and its surroundings will be ample reward for the trouble.

A few words in reference to the care of typhoid cases may be of interest to some of our readers. In all cases cleanliness and disinfection are the first things to consider, not only for the sake of the patient, but for the good of others in prospect. As the special lesion of typhoid fever is the inflammation and ulceration of the glands in the mucous membrane of the bowels, consequently the emanations from the bowels should be most thoroughly disinfected. We would recommend the use of a saturated solution of copperas in sufficient quantity to thoroughly come in contact with all the effete matter, perhaps standing in it for thirty minutes, after which it should always be buried a safe distance from the dwelling, in a hole dug for the purpose, three or four feet deep; and every deposit thus buried should be covered with earth or ashes immediately. In addition to this, we often

give a mild disinfectant internally, thus making an additional safeguard in the line of disinfection. Salol, salicylic acid, or naphthol in small doses will prove efficacious.

Beyond disinfection, the two most important considerations are feeding and reducing the temperature. The old saying, "Stuff a cold and starve a fever," in the light of modern practice must be reversed. In other words, it is very important to feed in fever cases, for two reasons: First, the strength must be maintained as far as possible; and, second, in the process of generating heat the food may act as fuel to a considerable extent, thus sparing the tissues of the body. Hence we see a marked difference in the flesh of those who are well fed while passing through a run of typhoid fever. In fact, lives have been saved by pressing the food even against the inclination of the patient. We have found milk to be a food *par excellence* in these cases. This should be taken in the early stages of the fever to the extent of a glass every two hours; but quite often in the later stages of the disease it will be impossible to give that amount, possibly not half that amount. But it is certainly worthy of note that typhoid patients who are well fed during the attack, if fed on milk mainly, come through the attack without that marked emaciation which characterises those treated on the other plan.

In reference to reducing the fever, we do not rely as much upon the use of antipyretics as we would upon good nursing, with sponge baths, compresses, ice bags, or cold water bottles. Great care should be taken in adapting the treatment to the vitality of the individual. In cases of a weak constitution, a sponge bath occasionally with a cool compress will be quite sufficient to keep the fever within reasonable bounds. In the stronger individuals, where the temperature ranges about 104 deg., we would recommend in addition to the sponges and compresses, every half hour cool enemata of water, especially in the early stages of the disease; but great care should be exercised in its later stages with this treatment. An ice bag to the spine for a few minutes at a time will also be of great advantage.

Good nursing, with proper attention to every detail, will do much to hasten the recovery.

THE SKITTISH DOCTOR.—Frederick H. Cogswell, in *Harper's New Monthly Magazine*, relates the following:—Dr. S. was noted among his professional brethren for his power of concentration. When once he bent his mind to a problem he became totally oblivious to everything about him. The doctor had a horse that was almost as famous as himself. Among her peculiarities was the habit of shying. She would not shy at things which most horses consider fit subjects for that sort of digression. She would pay no attention whatever to a newspaper blowing about the streets, but was mortally afraid of a covered waggon. At the sight of one of New Haven's suburban stages she would run over the curb-stone and threaten not only the doctor's life, but that of the chance passer. Of this habit she could not be broken. It seemed as though she could smell a stage long before it came in sight, so that the doctor would go half-a-dozen blocks out of his way rather than meet one. Early one morning he received a telephone call to the effect that one of his patients had become alarmingly worse. Without waiting for his carriage he started to walk, the distance being about a mile. His mind became absorbed in the case, but not so much so that he did not remember that the course of the Seymour stage lay right in his path. He looked at his watch and saw that he would be sure to meet it if he went the shortest way. He was in a hurry to get to his patient, but there was help no for it. He uttered a malediction over the circumstances and turned off at the first corner. This obliged him to nearly double the distance, and the day was warm. He walked as he never walked before, and failed to recognise a couple of intimate friends whom he nearly ran over. It was not until he had spent two hours with his patient, and came out to look for his horse, that he began to realise he had walked a mile out of his way, so that he need not shy at the Seymour stage!

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**MUFFINS.**—Dissolve one-half cake of yeast in one quart of tepid water, one teaspoonful of salt, and enough flour to make a thin batter. Let it stand all night. Early next morning beat the batter well; set in a warm place, and let it rise. Bake on a griddle, turning only once. Simple as this recipe sounds, it requires experience to tell the right consistency of the batter, and just the right heat at which to cook these muffins of our grandmothers. They will present rather a shapeless appearance as they are dropped from a spoon, but they should be crisp, light, and without a suspicion of toughness. If well made they are delicious.

**WAFERS.**—Mix four spoonfuls of flour, the same quantity of sugar, and the same of cream, with one spoonful of butter, and season with orange peel (grated), mace, and nutmeg. Cream the butter first, add sugar, flour, cream, and seasoning, and beat well. Bake in wafer irons, rolling while hot, and afterward filling with raspberry or strawberry jam.

**SIPPET PUDDING.**—Cut slices of bread very thin, butter them, and lay in a baking dish (butter the dish first), strewing over them citron, raisins, and currants with sugar. Put in alternate layers of bread and the fruit. Pour over the whole an unboiled custard of milk and eggs as sweet as you like it. Add a glassful of brandy, and bake a light brown.

**BRAIN CUTLETS.**—Soak in tepid, salt water, skin and wash. Boil in hot water ten minutes. Throw in cold water. Drain. When cold, mould into cutlets, dip in egg and cracker, and fry in deep lard. Serve with tomato or mushroom sauce.

**PIGEON CUTLETS.**—Stew birds (whole) in stock; cut up, dip in egg and crumbs mixed with cayenne, thyme, parsley, and lemon peel. Fry in deep lard and thicken stock for gravy.

**GOOSE AND ONIONS.**—Stuff with a mixture of three hot, mashed potatoes, stirred with one tablespoonful of butter, a little salt and pepper, one tablespoonful of powdered sage, and three chopped onions. Serve with apple sauce.

**CHICKEN PIE.**—Stew skinned feet, wingtips, neck, and giblets with a little water, one slice each of onion and carrot. Reduce one-half. Add a little lemon juice. Put dismembered chicken in dish, cover with strained gravy, rings of hard-boiled whites of eggs, slices of yolk, then with gashed pastry, and bake.

**BROWNED OYSTERS ON TOAST.**—Mix the yolks of two eggs with a little flour. Season twenty-four oysters and dip in batter. Brown in hot butter. Then add oyster liquor to flour, stirred in the butter, simmer three minutes, add oysters again, and serve on toast.

**KIDNEYS.**—Soak in vinegar and water one hour. Split, season with pepper and salt, and fry in butter. Sprinkle with chopped onion, if liked. Serve with sauce.

**FRIED VENISON.**—Slice from loin or leg. Heat plenty of butter, fry meat quickly, add salt, pepper, and two tablespoonful of currant jelly to one pound of meat. Cook twenty minutes.

**CANNED TOMATOES.**—When possible get the dark-red tomatoes and have them perfectly ripe and sound. Put about a peck of tomatoes in a pan and cover them with boiling water. Let them stand for about five minutes; then pare them and cut in small pieces, dropping them into an earthen dish. Put the cut tomatoes in a porcelain or granite-ware kettle and, setting them on the stove, heat slowly to the boiling point, stirring often. Boiled gently for an hour. Put glass jars and covers in a pan containing warm water and place on the fire until the water almost boils. Drain the water from the jars, one at a time, and fill to overflowing with the boiling hot tomatoes. Put on the covers and fasten them. Place the jars where a cool draught will not strike them, as that might crack the hot glass. When the fruit is cold, place it in a cool, dark place. If the closet or room is not very dark, wrap each jar in newspaper before putting it away.

**CANNED PEARS.**—Weigh the fruit; then make a syrup with one quart of water and three pounds of sugar for every ten pounds of fruit. Pare the pears and drop them in cold water as fast as they are pared. Have the syrup well skimmed. Take the pears from the water and, putting them in the syrup, boil gently until they can be pierced easily with a silver fork. Have the glass jars heated as for tomatoes, and fill them with fruit; then fill up with the boiling syrup. Put on the covers and fasten. A small piece of preserved ginger put into a jar of pears gives a slight change of flavour. As this flavour is not always liked, only a few jars should have the ginger added.

**ROASTED TOMATOES.**—Plunge in boiling water for half-a-minute six good-sized, red, sound tomatoes; drain and peel them neatly, then cut away the tops without detaching them entirely, and remove the seeds with a teaspoon. Divide an ounce of good butter into six equal parts and put a piece into each tomato, seasoning with a light saltspoonful of salt and one-half the quantity of pepper. Close the tops and put them in a buttered baking dish, moistening each tomato with a very little sweet oil. Put them in a hot oven and bake for twelve minutes. Remove with a cake-turner, dress them on a hot dish and serve.

## HINTS FOR THE HOUSEHOLD.

**ARTICLES** of food that are damp or juicy should never be left in paper. Paper is merely a compound of rags, glue, lime, and similar substances, with acids and chemicals intermixed, and when damp is unfit to touch things that are to be eaten.

**CHEMISTS** say that it takes more than twice as much sugar to sweeten preserves, sauces, &c., if put in when they begin to cook, as it does to sweeten them after the fruit is cooked.

To keep black stockings from turning a greenish colour wash them with soap that is free of soda, and add a teaspoonful of vinegar to the rinsing water. Wring them out, and clap them into shape, but do not iron, as the heat tends to destroy the colour.

**IRONING WITH THE CLOTHES-WRINGER.**—An authority on domestic economy advises the housekeeper of limited means to save her fire and strength, and to do as much ironing with the clothes-wringer as possible. Plain pieces, like towels, pillow-cases, sheets, merinos, and stockings, put through the wringer will be smooth enough for all practical purposes, if the rollers are tight. Life is too short, and flesh and blood are too precious to be wasted in sprinkling, folding, unfolding, ironing, and airing a lot of white goods.

A **SPONGE** large enough to expand and fill the chimney, after having been squeezed in, tied to a slender stick, is the best thing with which to clean a lamp chimney.

For cleaning out corners in furniture and window-sashes use hard wood pointed skewers such as butchers use to do up the meat in preparing it for cooking.

It is said that there is no better or simpler way of testing suspected water than the following:—Fill a clean pint bottle nearly full of the water to be tested, and dissolve in it half a teaspoonful of loaf or granulated sugar. Cork the bottle, and keep in a warm place two days. If the water becomes cloudy or milky within forty-eight hours, it is unfit for domestic use.

A **LARGE KITCHEN.**—The statement is made that the Bon Marché in Paris possesses probably the largest kitchen in the world. It provides food for all the employés of the house—4000 in number. The smallest kettle holds 75 quarts, the largest 375 quarts. There are 50 frying-pans, each of which is capable of cooking 300 cutlets at a time, or frying 220 pounds of potatoes. When there are omelets for breakfast 7800 eggs are used. Sixty cooks and 100 kitchen boys are employed.

A **POCKET NIGHT-LAMP.**—To instantly obtain a light sufficient to read the time by a watch or clock by night without danger of setting things

on fire is an easy matter. Take an oblong phial of the clearest glass, put into it a piece of phosphorus about the size of a pea, pour upon this some pure olive oil, heated to the boiling point; the bottle is to be filled about one-third full, then cork tightly. To use the light, remove the cork, allow the air to enter, then re-cork. The whole empty space in the bottle will then become luminous, and the light will be a good one. As soon as the light becomes dim its power can be increased by opening the bottle and allowing a fresh supply of air to enter. In very cold weather it is sometimes necessary to heat the phial between the hands to increase the fluidity of the oil, and one bottle will last a whole winter. This ingenious contrivance may be carried in the pocket, and is used by watchmen in Paris in all the magazines where explosives or inflammable materials are stored.

**EDUCATION OF A CHEF.**—The making of a man cook in France is a lengthy and tedious process. According to a French steward, a young man, when he decides to pursue a culinary career, selects his nominal instructor, to whom he pays a sum equivalent to about a guinea. The aspirant is first assigned to the vegetable cook, who teaches him how to prepare the raw materials. When he has mastered this he is initiated into the mystery of cooking them. This thoroughly learned, he studies the way of cutting up raw meats, of preparing fish, and how to stuff, dress, truss, and lard game and poultry. When he has learned this he is placed before the range, where he receives instruction in the various processes of broiling, frying, roasting, and baking. When he graduates from this department he passes under the control of the second cook, who reveals to him the mysteries of sauces and soups. The interest of this functionary in his pupil it is necessary to accelerate with liberal and frequent tips. The student is then put in charge of the pastry cook, to whom he serves a long apprenticeship in all that pertains to the concoction of sweets, pastries, and ices. This completes his culinary education, and he is prepared to assume the rôle of a competent cook.

**THREE WAYS OF COOKING CAULIFLOWER.**—Baked with cheese in small dishes or shells, one for each person, makes a very good entrée, and is cooked in the following way:—For eight persons you will need about ten ounces of soft-boiled cauliflower, three ounces of grated cheese, two ounces of butter, half a gill of rich milk, and some grated bread-crumbs. Put a layer of cauliflower in each dish, sprinkle it with cheese, and dot it with small bits of butter, so that the dish is nearly filled with alternate layers; put some butter on the top, mix pepper and salt with the cream, pour it over the cauliflower, then cover each dish with the bread crumbs, finishing with dots of butter. Bake until it is of a light brown colour. Another method of cooking cauliflower is to have it *en purée*. Cut the head of a good-sized cauliflower into small pieces and boil them in some boiling water with salt, pepper, and a pat of butter; drain them, and put them into a saucepan with a liberal quantity of white sauce; stir with a wooden spoon until it is a soft paste. Then rub through a colander into a small stewpan. Just before serving it make it hot, mix in a little grated nutmeg, a pinch of sugar, and a little cream. This is very delicate. Small, irregular heads of cauliflower may be used up in this way: Boil until very tender, drain well and cut into small pieces; put it in layers with finely-chopped egg and this dressing: Half a pint of thickened milk, with two tablespoonfuls of flour, well seasoned with pepper and salt, and two ounces of butter. Cover the top with grated bread and little pieces of butter, and put it into the oven to brown. It must be served in the same dish in which it is baked.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

# THE MOTHER'S PAGE.

## STORY-TELLING: ITS BENEFITS TO CHILDREN.

By MRS. EMMA H. ADAMS.

EVERY child has a natural relish for stories. This is a broad statement, but evidence of its truthfulness is found in the million storybooks which crowd the shelves of libraries and bookstores the world over. It is found, also, in the columns set apart for children's stories in every religious newspaper, and in hundreds of weekly secular journals. It is found in the fact that multitudes of writers are devoting the best of talent and years of time to thinking out stories for children, infant children, children of every age. It is found, moreover, in the fervent entreaty uttered daily by myriads of little ones, "Mamma, tell me a story, tell me a story."

Were we not speaking of children, we might also, in confirmation of our assertion, mention the vast mass of literature annually appearing in story form for the recreation, amusement, and sometimes genuine upbuilding of adult people, all proving that a natural taste for stories, tales, narratives, whatever one pleases to call them, comes in with our birth, and goes out only with our final breath.

If this be so, then in all homes, and for strong reasons, the matter deserves far more attention than it receives. Glance again at our subject, "Every child has a natural relish for stories." The statement has the force of an aphorism. More than that, it has the force of a maxim. There is in it a guiding principle for the mother. What is this principle? Let me answer the question by using an illustration.

A child comes into the world possessing a natural appetite for food. What does this indicate to the mother?—Simply that Nature has so planned that the infant shall live and grow by eating food. This and exercise are the means by which it attains physical development. Does it ever occur to the mother to destroy the appetite by giving her child food but once a week at first, then at longer intervals, and after a while none at all?—No, truly. She ministers to the appetite, and has the pleasure of seeing her babe increase daily in size and strength.

Now this desire is a guiding principle with respect to the body. Food it must have regularly every day. Is not the child's natural craving for stories an indication of the need of the mind? How many mothers ever make systematic provision for this sort of child hunger? The little ones would literally famish, physically, were not greater care taken to nourish the body than is practised in feeding the mind during the first few years of childhood.

Why should the mother, why should either parent, take less thought for the one than for the other? Mothers cook and sew, wash, iron, and mend tirelessly for the growing body, but too often leave the expanding mind to pick up, undirected, whatever nutriment comes in its way. To be sure, the mind of a child will unfold despite the absence of stories. Through the eye, ear, and sense of touch, material by which it grows is received constantly, but in too many instances this is but mental garbage from the street. The more time the child spends upon the street, the more of this ill-adapted aliment will be taken in. May not nourishment much more wholesome be derived from story-telling, methodical and fitting? We are convinced that the ever-welcome pastime may be made, to most children, an effective means of education. Now, how may it be made so?

Primarily, to educate a person is to draw out or develop the powers within him. If, then, a mother tells her child stories which shall help him to think, to observe, to invent, to practice kindness, to love his playmates, to be industrious, to be self-helpful, and always loyal to

truth, is she is not educating him? From books, travel, observation, and daily happenings, material for her work may be drawn.

But education need not be the mother's sole aim. Stories may be told to allay temper, to induce sleep, to soothe suffering, to divert from grief, from disappointment, and from wants full of harm. They may be told as a reward for well-doing, and to attach the child to home.

We have in mind an instance which illustrates admirably how temper may be calmed by story-telling. The little daughter of a friend had formed the aggravating habit of throwing herself full length upon the carpet, face downward, and kicking the floor furiously when matters did not proceed to her liking. At first my friend paid little attention to these ebullitions of passion, and allowed the little maiden to kick until smarting toes made her glad to desist, hoping this self-inflicted punishment would soon effect a cure of the fault. She was mistaken. The child had the gift of perseverance.

Finally, the mother decided that something must be done. The next time Miss Lottie's toes made the house resound with their strokes, she stepped quietly to the child, and said in pleasant tones, "Lottie, I wish to tell you a story, and I must tell it now." The last word had a magic effect. Soon the active feet were still. During the next two minutes Lottie appeared to be considering the situation. Then, springing up quickly, she took a seat beside her mother, and listened to a story about a little boy who was accustomed, whenever he became angry, to bump his head rapidly against some door near. This he did, despite punishment, until severe headaches were induced, from which he suffered many years. Not the slightest reference was made to the little girl's misdoing. She was shown, simply, that yielding to passion brings inevitable consequences. The unwise boy could not think as well, read as long, work as hard, nor ever after be as happy as otherwise he might have been. From that day Lottie ceased to vent her ill-humour upon the unoffending floor.

We all have known children to be diverted from what were to them keen sorrows by an entertaining story. Certainly such course is far more humane than to leave the little sufferer to grieve on and on, until his trouble becomes something formidable. Sensitive children are often deeply hurt by the petty slights, taunts, or cruel insinuations of their playmates. A simple story told in a tender way, showing the mother's sympathy, and at the same time teaching a little lesson of moral heroism, often proves a balm for such wounds. Affairs are ever happening out of which the thoughtful mother may fabricate stories for such occasions.

Then, after the child's mind has been turned from his grievance, he may be shown the folly of feeling so deeply hurt by thrusts of that sort. To a degree this arms him against the next attack. And repeated helping may lift him to a height where these venomous shafts cannot reach him. Many such apparently small occasions may be made opportunities for character building in children, could mothers so see them. I have known little ones to be heartlessly left to chafe, worry, and grieve over such wounding, until sleep, more tender than the mother, relieved them of their burden.

There is another admirable use to which stories may be put, and that is the telling them to restless children at their hour for retiring. A child who, otherwise, might lie awake for hours, may by this means be soothed early to sleep. A friend informs me that she has practiced the pretty art, recently, on putting her little daughter in bed, and has found it decidedly efficacious. Formerly, at one moment the child would be found on one side of the bed, and the next moment on the other. There are mothers who leave such children alone to fight the tiresome battle to the end, even though it take far into the night to gain the victory.

We wish heartily that mothers generally would try the story-telling remedy for child insomnia, bearing in mind that for hygienic reasons children should always fall asleep with hearts light and happy. Indeed, when-

ever the arrangement can be made, we advocate the telling of stories at evening for the benefit of all concerned. Of course, they should be stories which will neither excite fear, produce wakefulness, nor cause disturbing dreams. They should help the whole household to forget care, to rest after hard labour, after severe study, or they should be such as will instruct on some interesting subject.

Another topic, Story-telling may be employed to render home attractive to children. The mother need not proclaim that her stories are for this purpose. She is not obliged to disclose to her little ones all her plans for attaching them to the fireside. That step might defeat the scheme totally. Such is the perversity of human nature, that if one knows a trap is set for him, he will take especial pains to keep out of it.

Now just at this point comes in a very pleasant feature of story-telling. The children themselves may take part in the exercise. It is well known that even very young children will learn to tell stories about things they have seen, heard, or experienced in a surprisingly brief time. We are all aware that taking a hand in anything increases our interest therein. So it is with little men and little women. If each member is expected to join the family group at evening, prepared to give an intelligible account of something he has seen, heard, or read during the day, he will not only gladly be present, but he will take a keener interest in the efforts of all the others. Imagine, if you can, the benefits and the charm of an hour so spent each day.

In this pastime, more than appears at first sight, lies an opportunity for training children in important directions. Think how much is included in story-telling. It awakens the child's power to construct, or to create, if that term be better. He is obliged to form sentences to clothe his ideas with words. It involves consecutive thinking—step after step. It develops ability to perceive quickly the lesson or main truth in a story, and to present it with force and clearness.

Now, to do all this is to do momentous things. They may not be done consciously, in a single instance, but they are done. The child but three years of age may make a beginning in this work, and grow therein. Who can estimate the power a child will have acquired by such practice, led along by an earnest, judicious mother through six, eight, or ten years? And who can estimate the improvement the mother herself will have made? Helping her children, she has helped herself wonderfully. Think what evil her little brood has escaped while occupied so pleasantly at home. Think of the development of kindly affection which has taken place in the young hearts meanwhile. Are not all these results worth the striving for.

Again, stories may be told to children as a reward for obedience, for faithfulness in performing tasks, for exercising patience under trial, for practising self-denial, or for bravely bearing pain. And I suggest that stories told for any of these purposes be specially adapted to the circumstances, or, in other words, that they be such as will encourage the child in the thing he has done. If justification of this course be sought, it will readily be found in the way our divine Father deals with us under similar circumstances. I suggest further that, for the benefit of all concerned, these stories be told at evening, when the world, with its pleasures and temptations, is shut out.

Lastly, story-telling may be made a means of cultivating in children a taste for literature, not necessarily the story department of literature, but a taste for history, biography, works of travel, and of science, particularly the sciences of astronomy, botany, ornithology, and entomology.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully compiled from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

"The FAMILY DOCTOR. Truly an Astonishing Pennyworth."—*Knowledge*.

**STEADMAN'S Soothing Powders** for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, &c., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Waltham, Surrey. Sold everywhere. Please observe the **SS** in Steadman.

[SPECIAL ARTICLE.]

## DANGER OF INFECTION FROM THE SACRAMENTAL CUP.

By H. L. MANNING.

ONE hesitates to criticise long established customs connected with religious observances, and yet considerable has been written and said of late as to objectionable features from the standpoint of a sanitarian, in the mode of administering wine in the memorial supper. In the *Annals of Hygiene* for October, A. Van Derwerken, an American writer, has a very plain and thoughtful article on the subject, in which he sums up his objections to the use of one, two, or three cups at the Communion Table as follows:—1. The custom is unclean. 2. There is a possibility of spreading disease. 3. It is inconvenient and awkward. 4. We are not aware that there is any sanction of the mode by the authority of Christ.

In considering the condition of the wine when offered to the last communicant he says: "Think for a moment of the many through whose decayed and neglected teeth the consecrated symbol has been poured. Consider, if you will, the number of those who smoke; then you have those whose breath is tainted by a disordered stomach or catarrhal affection, and those, too, who suffer from diseased lungs, the breath of each being inhaled into the cup and absorbed by the wine, from all of these there is a dribbling back of mingled saliva and wine, and then decide whether we are not correct in speaking of the practice that now obtains in our churches as unclean."

Under the second heading, as to its possibly being a means of communicating disease, he enumerates sore lips, ulcerated mouths, and incipient forms of diphtheria. He might have gone farther, and suggested the possibility of infection from still more loathsome diseases.

I sympathise with Mr. Van Derwerken when he speaks of having sometimes stayed away from service on days when the communion was to be celebrated, for reasons of uncleanness of the cup, since I must confess to being rather glad of excuse for doing the same, though I have reproached myself for the fastidious feeling with which I viewed the disposal of the sacred elements. But many years ago I was visiting in a town where I was told of a woman who had been a Magdalene and who never suffered herself to go to the table of the Lord for the reason that the condition in which her mouth and gums had been, and still were, made her feel that it would be unsafe for others to touch the cup after her. This made me wonder if every such person were as conscientious, though probably such instances are infrequent.

The third objection, that the custom is awkward, nearly every one will admit, many of the communion cups being exceedingly clumsy.

The fourth objection named is that we have no positive proof that our Lord and his twelve disciples all drank from one cup; in fact, it is probable that they did not, as they had just partaken of an ordinary meal when the ordinance was instituted. Probably the wine was blessed in bulk, and then poured into individual cups. With our own family and friends we are very particular about having our individual cups and glasses—why should we be less cleanly and delicate at the Lord's Table? A sensitive person cannot take wine from a cup used by hundreds without a feeling of repugnance. We should certainly honour Him who yielded up His very life for us equally as much as we do our earthly guests by being scrupulously particular to provide all things cleanly for the memorial feast.

The remedy which Mr. Van Derwerken proposes for this evil, is to let the officers of the church provide as many small cups as there are communicants. These tiny vessels could be made of sterling silver, plated white metal, china, or glass, but preferably the last, because they could be kept clean with less difficulty than silver. They could have handles, and if necessary be flaring at the bottom, and they could be placed upon trays or any other mechanical device, arranged in rows in

pyramidal shapes, which device could have a handle adjusted to it so as to be easily carried, and each little cup could rest in a socket. From fifty to one hundred could be placed upon each tray, and the consecrated wine could be poured into these diminutive vessels and passed around for each person to drink from a cup which no one else had used. In those churches where the communicants kneel at an altar rail, a table or shelf could be arranged on brackets inside, and attached to the altar rail in such a manner as to drop when not required for use. The cups might be placed upon this table of the Lord, and while the persons were in a kneeling posture, the clergyman could hand each one a vessel of the blessed wine.

Since the publication of this article in the *Annals of Hygiene*, the suggestions offered have been tried in several places. It is the custom of the Methodist Church of Norway, America, to have the communicants kneel at the altar rail. Twice as many tiny, tumbler-shaped glasses as the number of persons who could be accommodated at one time were provided, in order that one set might be cleansed while the other was in use. The pastor and the local deacons administered the sacrament. A small tray on the communion table held glasses sufficient to supply all who could kneel around the altar at one time, and into these was poured the consecrated wine. The time occupied by one brother in dismissing the communicants was used by another in getting ready for those who would come next. This was repeated until all had communed, and the number was above the average. "There was no confusion, no mishap, no jingling of glasses, nor was the sacredness of the ceremony at all marred," says one in writing of it. He also adds that the people fell into line as naturally as if it had been their usual custom, and that they voted it a success. Such a practical demonstration is of no small value to advocates of the reform. What has been done by one church can be done by a multitude of others.

It occurs to me that some might find the use of a single flaring silver or crystal bowl with individual spoons a more convenient method than the one mentioned above. Probably the greater number of communicants would prefer to come provided with his or her own, and in these days of the craze for souvenir spoons, why might not one be sacredly set apart for this use? As to those provided by the society, silver plated spoons could be procured at no very great expense, since the service is observed so infrequently that single plated ware would probably answer if no better could be afforded. Better than this would be the use of special aluminium spoons, which could be kept bright and clean equally as well as silver, and would be less expensive. A ladle-shaped spoon would be the most convenient, and this form appears in some of the souvenir spoons.

It is of great importance that this much needed reform be brought about; the manner may be widely varied to suit the needs or conveniences of different church organisations and communities.

**VENTILATION OF SCHOOL ROOMS.**—A word concerning ventilation may be useful. There is hardly a properly ventilated school-room to be found anywhere, especially if the number of pupils in it is large. Few realise how much fresh air is necessary to keep school-room air pure. One otherwise well constructed ought to have its air changed once in fifteen minutes. Of course, in warm weather the windows are kept open all the time, and this answers all needs; but in colder weather, in addition to ordinary ventilation, if the air could be changed every fifteen minutes it would be none too frequent. This will no doubt be considered impracticable; but once in each half hour or hour at least, a thorough sweeping out of the air in the room by wind ventilation ought not to disturb the order of school routine, and the better work done by the pupils will more than compensate for any loss of time. In addition to this, air should be admitted through every window by small openings between the sash, made by raising the lower sash a little and dropping the upper one a little. This brings fresh air into different parts of the room without draft or chilling of the pupils and helps to keep it tolerably pure.

## TIRED FEET.

**W**ALKING heats the feet, standing causes them to swell, and both are tiresome and exhaustive when prolonged. There are various kinds of foot baths, and authorities differ as to their value. Hot water enlarges the feet by drawing the blood to them; when used they should be rubbed or exercised before attempting to put on a tight boot. Mustard and hot water in foot bath will prevent a fever if taken in time, cure a nervous headache, and induce sleep. Bunions, corns, and callousness are Nature's protection against bad shoe leather. Two hot foot baths a week and a little pedicuring will remove the cause of much discomfort.

A warm bath with an ounce of sea-salt is almost as restful as a nap. Paddle in the water until it cools, dry with a rough towel, put on fresh stockings, have a change of shoes, and the woman who was "ready to drop" will have a very good "understanding" in ten minutes. The quickest relief from fatigue is to plunge the foot in ice-cold water and keep it immersed until there is a sensation of warmth. Another tonic for the sole is a handful of alcohol. This is a sure way of drying the feet after being out in the storm. Spirit baths are used by professional dancers, acrobats, and pedestrians to keep the feet in condition.

## HYGIENIC TREATMENT OF BRIGHT'S DISEASE.

**B**RIGHT'S disease is the name of a condition of the kidneys which should more properly be called nephritis and may exist in many forms. In its simplest form it is curable, provided the patient is not too old, has a fairly good constitution, and a healthy heart. When the heart is affected there is little hope, and a fatal issue is probable after a lapse of time difficult to determine. If the malady takes the form of a shrinking of the kidneys it is the same; all that can be done is to alleviate the sufferings of the patient and prolong his life. All violent exercise and alcoholic drinks must be avoided; also such vegetables as asparagus, which excite the action of the kidneys. The patient should live upon milk diet, and while in bed the upper part of the body should be kept rather warm. Dry heat is preferable, and a sojourn during winter in some mild climate is very beneficial. Turkish baths produce good results. Moderate exercise is necessary and the skin should be kept very clean and healthy by friction, sun-baths, warm clothing, &c. All colds must be avoided as they greatly aggravate the disease.

Bright's disease is in its nature a catarrhal condition of the kidneys, as bronchitis is of the lungs, or a cold in the head. There are degrees of inflammation, some being very superficial, others deeper seated. There is no doubt but in the future we shall be able to cure far more cases than are cured now.

Many persons imagine they have Bright's disease if they feel a pain in the back or if there is more or less deposit in the urine. Generally, however, this deposit does not indicate diseases of the kidneys, but consists of urate of soda, uric acid, and other abnormal products of nutrition which Nature throws out through this channel. Bright's disease is best diagnosed by a careful microscopic examination of the urine and other tests. It would not be so serious were not the kidneys so important organs, and so necessary to life and health. Let their functions cease only for a short time, and the products which they throw off would accumulate in the system, and poison the person so he would die as surely as if he had taken arsenic.

Some of the chief causes of this disease are: Taking cold which settles on the kidneys, instead of the throat and lungs, excessive eating of very rich and highly nitrogenised food, and the use of alcoholic articles, especially lager beer. The first causes congestive inflammation, and the others overworking of these organs and a consequent weakening of them.

The best preventives are, the avoidance of

these causes and keeping the skin healthy and active by proper bathing and friction. As we avoid a cold on the lungs by bathing so we avoid a cold on the kidneys by the same means.

[SPECIAL ARTICLE.]  
**WHAT TO EAT AND WHAT TO AVOID.**

**NUTRITIVE VALUE OF FOODS.**

**PART II.**

THE potential energy of the body is represented by the amount of material it contains that can be oxidised, that is, that can by union with oxygen be transformed into active or kinetic energy, as shown by heat evolved, or muscular work done. Heat and force, or work done, are so correlated that one can be measured by the other, and by burning food, that is by oxidising it, in or out of the body, and ascertaining how much heat it will produce, we can determine just how much force, or power to work, a certain amount and kind of food will furnish. The unit of calculation is called a calorie, and is the amount of heat that will raise 15,432 grains of water one degree in temperature, by a centigrade thermometer. For purposes of estimating its mechanical energy we illustrate by saying that the amount of heat required to raise the temperature of one pound of water to one degree Fah. is the equivalent of power to lift one pound avoirdupois 772 feet high. The following table represents the amount of heat and force value of various foods.

Table from Frankland showing the force producing value of 15,432 grains of various articles of food :—

List of Foods.	Heat Units.
Cod-liver Oil.....	9·107
Beef fat .....	9·069
Butter.....	7·264
Cocoa-nibs .....	6·873
Cheese, Cheshire .....	4·647
Isinglass.....	4·520
Bread-crust .....	4·453
Oatmeal .....	4·004
Flour .....	3·936
Pea-meal .....	3·936
Arrow-root .....	3·912
Ground Rice .....	3·813
Yolk of Egg .....	3·423
Lump Sugar .....	3·348
Hard-boiled Egg .....	2·386
Bread Crumb.....	2·231
Lean Ham, boiled.....	1·980
Mackerel .....	1·789
Beef, lean .....	1·567
Veal.....	1·314
Guinness Stout.....	1·076
Potatoes .....	1·013
Bass Ale. Alcohol reckoned.....	·775
White of Egg.....	·671
Milk .....	·662
Apples .....	·660
Carrots .....	·527
Cabbage .....	·434

If we take the force value reckoned above, and accept the calculation of Prof. Helmholtz that the human system is capable of utilising one-fifth of the actual energy developed by oxidation for external work, we can better understand the following table after Prof. Frankland :—

Weight and cost of various articles of food that would require to be burned in the system, to raise the body of a person weighing 140 lbs. to the height of 10,000 feet.

List of Foods.	Weight in lbs. required.	Price per lb.	Cost.
		s. d.	s. d.
Cod-liver Oil .....	0·553	3 6	1 11½
Beef fat .....	0·555	0 10	0 5½
Butter .....	0·693	1 6	1 0½
Cocoa-nibs .....	0·735	1 6	1 1¼
Cheshire Cheese .....	1·156	0 10	0 11½
Oatmeal .....	1·281	0 2½	0 3½
Arrow-root .....	1·287	1 0	1 3½

List of Foods.	Weight in lbs. required.	Price per lb.	Cost.
		s. d.	s. d.
Flour.....	1·311	0 2½	0 3¼
Pea-meal .....	1·335	0 3½	0 4½
Ground Rice .....	1·341	0 4	0 5½
Lump Sugar .....	1·505	0 6	0 9
Hard-boiled Eggs ...	2·209	0 6½	1 2½
Bread .....	2·345	0 2	0 4¾

Carrots .....	9·685	0 1½	1 2½
Cabbage .....	12·020	0 1	1 0¾
Guinness Stout .....	6¼ btls.	10d. pr btl.	5 7½
Bass Pale Ale.....	9 btls.	„ „	7 6

From these tables one may readily be guided in the selection of foods which give the very best results for heat and force production, at smallest cost. They demonstrate that the flesh of animals is not a necessary article of diet in order to supply the body with heat, or endow it with strength.

In making a selection of foods, consideration should be given to the season of the year. In summer, when the heat is more or less extreme, there is little necessity for heat-producing food compared with winter. Care should be taken not to overload the system with carbonaceous material during the hot months.

A great variety of foods at any one meal is objectionable on the score of health, good taste, and economy. In case of feeble digestion, particularly, three or four kinds, well prepared, will be more easily cared for and appropriated to the upbuilding of the organism, than will a greater number. It is better to secure variety from day to day, or from week to week, than at any one meal. The appetite will be keener, and the food will be more thoroughly appreciated, digested, and assimilated.

**HYPNOTISM IN CHURCH.**

SLEEPING in church is by no means an uncommon occurrence, and the fact that people so often go to sleep in church is usually put down as a proof that the clergy are poor preachers. This, however, is far from being the real cause. I am inclined to think, says Josiah Oldfield in the *Vegetarian*, that a sort of hypnotism is far nearer the truth.

Hypnotists usually proceed to act on the brain through the eye, but in churches the ear is the organ which is chiefly affected.

Ordinarily the result is produced by a peculiar stimulus applied through the optic nerves by a long continued gazing upon a bright spot. The iteration of the same sensations seems to produce a species of temporary paralysis of certain brain centres. In a similar way the services of the church act upon the brain chiefly through the ear.

The whole arrangement is very scientifically correct. At first the periodicity of the alterations is short; then there is a little music while the people sit; they stand for a few moments; they kneel and speak; they stand and sing; they sit and listen; gradually, however, the periods lengthen and the variations are less, till—apart from one or two small breaks—the people are put into a state of silent listening to a monotonous voice pitched in a specially soporific key, reciting words with which by constant recitation they have become perfectly familiar. They thus require no effort of mind to follow, but are more and more lulled by the sequential rhythm of sound into a state bordering upon the hypnotic, so that by the time the sermon is reached an irresistible somnolence too often pervades a large portion of the congregation.

An incidental proof of this is seen in the fact that when several clergy are officiating and one has a voice wholly out of harmony with the others—an out-of-tune voice—the hypnotising tendency of the service is prevented. In the same way when there is only one priest or deacon officiating, and his voice jars and breaks the harmony, the people have not the same tendency to sleep during his sermon, however poor a preacher he may be.

How far the power of the priesthood over the people has in all religions been increased by the quasi-hypnotising services which have preceded their speeches or sermons is difficult to say, but the lines which the Reformation eventually took seem to me to be just as much a protest—an unconscious one I admit—against the hypnotising power of the ceremonial of the Roman Catholic Mass as against the dogmas which the Church of Rome has attached to the primitive Catholic Faith.

In so-called “dissenting” churches the tendency has always been to break up the service by continually giving the congregation pieces in which they had to take part, and further keeping their attention more strained by much that is impromptu and variable. They lay less stress, too, upon the regular attendance at church, and the result is that their priesthood as a whole has less authority over their laity. The celebrants are men and are treated as such—if exceptionally good they are exceptionally honoured, but if individually faulty are individually condemned—but in those churches where the quasi-hypnotic service is an integral part, and where a regular attendance at it is required of members, we find the power of the priesthood remarkably increased, and they are regarded no longer as men but are looked up to with that peculiar reverence and awe with which the hypnotised always regard their hypnotiser. This holds good whether we go to the oracle of Apollo or the fetish worship of the King of Dahomey, whether we go to the temple of Isis, or to St. Peter’s at Rome.

**HOW TO PREVENT WRINKLES.**

WRINKLES are to a certain extent preventable. It is the habit of raising the eyebrows in speaking, turning the corners of the mouth down in contempt or discontent, the frequent frown in reading or thinking, or other needless grimaces which carve ugly lines even on very youthful faces. *Harper’s Bazaar* gives some practical suggestions on this subject: “Many wrinkles may be avoided by the woman who will takes some pains with her expression when she is by herself. She who bends over her book, her desk, or her sewing with knitted brow and compressed or working lips need not be surprised if her face refuses to smooth itself when she turns to other employments. It would cost her very little trouble to avoid such tricks of feature.

“There are other ways too of retarding the approach of wrinkles. The woman whose face lines have a downward droop should wash and dry it from the chin upwards—so say the wise ones—and she should wipe the eyes from the outer corners towards the nose. She should avoid all such habits as lifting the eyebrows, drawing down the corners of the mouth, making *moues*—or, in plain English, grimacing. A potent aid in preventing wrinkles is said to be a few moments of absolute facial repose taken several times a day. With closed eyes and relaxed features, the wrinkle-hater should remain in perfect placidity, resting her soul on the thought that she is retarding the march of time—or, at least, its visible progress upon her physiognomy.”

But as thought is the chisel which is continually at work with the features of every human being, would it not be wiser not to think of the wrinkles at all, lest such anxious thought-taking should be all the more plainly manifested in the deepening of the disagreeable lines. Looking away from the self and the condition so feared, directing the thought to something especially restful and soothing would be a more profitable use of time and it would assuredly be promotive of better results. Serenity of mind is made to serenity of expression, and fretful, distressed, or worried thought leaves more unsightly lines on brow and cheek than the flight of the years.

When the lower half of the countenance, measured from the nose downward, is divided by the mouth into two equal parts seen in profile, the indication is of stupidity.

## EFFECT OF LIGHT ON NUTRITION.

**L**IGHT is of great importance in promoting the nutrition, and it acts in a favourable way in this respect. There were even times when light was invested with an exaggerated influence, when light and shade diseases were acknowledged, and when statistical tables were made to show the influence of light on mortality. It is not amiss to examine how far the action of light participates in certain modifications of our health, which are usually ascribed to air and heat alone. One can never behold children who have lived in lightless basements or in houses situated in dark streets, bloom up during a sojourn in the country, nor, as happens every year to those children in cities sent by kind friends for a week or more in the country, view the successful working of vacation colonies, without asking whether the greater abundance of light was not a material element in this invigoration. And the strong illumination near the sea—is not also to its action the curative influence partly due which children, playing on the seashore, derive from a sojourn at a sea resort? Is not the beneficial effect of motion in the open air partly dependent on the co-operation of light? These questions are not wholly idle in times in which it is often supposed that motion in the open air might be replaced by gymnastic exercises in rooms; in which highly ingenious machineries are constructed under the name of ascension apparatuses, &c., for the purpose of affording the enjoyment of these exercises in some back room. It is always to be considered that besides air, heat, and motion, light is a potent element in all that concerns the healthy development of man, and to the well founded hygienic demand for more air should be added—not only in a metaphorical sense—Goethe's last request: "More light!"

From this we may also infer that exercise in gymnasiums has not nearly the value it has in the open air. The Greeks knew this, and had theirs where much light was present, and many of these exercises were out of doors. So far as possible we should do the same. Light is a wonderful stimulant to the bodily functions.

## A CURE FOR DYSPEPSIA.

**A**SALLOW-FACED, unhappy-looking man came to Dr. B.'s consulting room one day when the writer chanced to be present. He wanted some medicine for dyspepsia. Among other questions, the doctor asked, "How long a time do you usually spend at dinner?"

"I don't know, exactly," replied the patient. "Ten or fifteen minutes, perhaps."

"Does your food taste good?" Dr. B. asked.

"That it does," was the reply, "but half an hour after I've eaten it I'm near dying with distress."

"Do you drink much with your food—tea, coffee, or water?"

"A pretty considerable amount," answered the man.

"Yours is a very grave case," said the doctor, "but I can help you if you'll follow my directions."

Dr. B. gave the man a dark-coloured mixture in a bottle and said: "Now, it is of the utmost importance that this medicine be taken properly. Put a teaspoonful into your cup of tea or coffee at each meal; stir it in thoroughly, and with each mouthful of food take a very small sip, and then chew, chew, chew, in order to mix it completely with the food. Do this and report to me in a week."

Two weeks later I saw this dyspeptic again, but I scarcely recognised him, he was so much improved in looks.

"That medicine of yours works like a charm," he said to the doctor, "I've about forgotten that I have a stomach."

"That's good," responded Dr. B. "Continue taking it in the same way for three months, and you'll be a new man."

Then, as the man went out, Dr. B. said to me: "The whole story of that man's cure is in the word mastication. It is merely what I said to

him, chew, chew, chew; but he wouldn't have believed it without the medicine, which was the simplest. The man was bolting his food, and I stopped it."

## A CITY OF LUNATICS.

**A** WRITER in *The Outlook* gives an interesting account of a visit to Gheel, "the City of the Simple," as it is styled, from which we extract the following:—

Taking the train east from Antwerp, I was soon set down at my destination, which I found to be a quaint, old-fashioned little town, apparently in no way different from the toy-like towns and villages to be found all through Flanders. It was pierced by a long, straggling street bordered with two-story whitewashed houses; and a couple of inns, externally plain, but internally roomy and inviting, offered there accommodations to the weary traveller. It was to all appearances a prosperous community, and, considering the fact that a large proportion of its inhabitants were unconfined lunatics, it was to me an unexpectedly quiet one.

I put up at the inn called the "Armes de Turnhout." My host and hostess were a handsome young couple, full of life and gaiety, and most attentive to the necessities and comforts of their guests. A few hours' chat with them put me in possession of a number of most interesting facts, and prepared me for my subsequent encounters with some of the afflicted dwellers within the gates.

In the parlour of the hotel where I sat that evening, there were gathered ten or twelve *habitues* of the place, some sipping their beer and smoking, others reading, and several engaged in playing dominoes. To pass the time, I had picked up a Flemish newspaper, when presently there came through the open window the loud, commanding voice of someone in the street below.

"Poor fellow," said one of the guests, as we looked out together, "he imagines himself to be Napoleon, and he is giving orders to his troops, who are gathered for the Battle of Waterloo. He is quite harmless. See?"

And, lo! as the lunatic was giving the word of command to his imaginary legions to wheel and charge in battalions, a little fellow of six plucked the skirt of his blouse and whispered a word in his ear, when, quick as a flash, the *soi distant* emperor was transformed into a quiet, humble, shamefaced man, who, with shambling step and downcast eye, suffered the boy to lead him into an adjacent cottage.

I utilised this incident to start a conversation with the man who had acted as my informant. I found him quick and intelligent, and I thought he was, like myself a visiting stranger, so that what followed gave me one of the greatest surprises of my life. We had got into a discussion upon the policy of the Government, and our argument had grown somewhat warm, when suddenly the man arose and exclaimed: "Listen to me, monsieur. Evidently you do not know to whom your are speaking. I am the presiding genius of this country, and without me Belgium could not exist a day. I pass my time in reading the papers and studying events, and every night I send my orders to the King, who is a mere puppet in my hands. And now, sir, good-night; for the hour has come at which this solemn duty demands my undivided attention. Another time I advise you to find out who you are talking with before you express your opinions so dogmatically." And with that he marched out of the room.

It was not long before I found out that most of the others were also monomaniacs. One of the domino-players shortly afterwards rose and started off towards the railway station. He was continually expecting a case of wine, which never came. Day after day he went there on the same errand, always receiving a hopeful answer from the porter, who understood his case, and going away satisfied. One of the company thought he was the moon, and could not be persuaded to go out-of-doors until evening came. Another imagined himself to be made of glass, and was extremely careful in his movements lest he should break himself. The fifth had an idea that a sum of money was concealed in the lining of his coat. "Feel them for

yourself. Hear them chink," he would say, shaking the garment, and then he would go on sorrowfully, "But I can't get them out; I can't get them out. I have often picked the seam, but its no use. Still, they are there plain enough—chink, chink! Don't you hear?"

Gheel has a legend which gives to a heathen King of Ireland the credit, or discredit, of bringing about its beginning as a resort for those afflicted with mental disorders. Dymphna, whose canonised name is revered by these people, being persecuted by the King, her father, fled from her home and found her way to Gheel, where she entered a convent. Hither she was tracked by her inhuman parent, who, in a fit of rage, smote off her head with his sword. Among the witnesses of this cruel murder were a number of lunatics, who, by the fright they received, were instantly restored to reason, whereupon the bystanders cried out, "A miracle! A miracle!" and proclaimed throughout the adjacent country that God had indicated the purity and devotion of the Christian virgin by thus causing her death to be the means of restoring reason to the unfortunate.

This happened in the seventh century, and so for twelve hundred years Gheel has been "the City of the Simple," and the people became expert in their peculiar methods of treatment. The place now numbers over ten thousand inhabitants, nearly two thousand being lunatics who have been sent from various parts of Europe to receive the benefits of the Gheelois system.

Unlike the insane of other communities, the patients at Gheel are not confined in asylums, but are lodged in families, where they have perfect freedom, and can hold constant intercourse with their kindly hosts. They come and go as they please, play with the children, of whom they are almost invariably fond, and if they desire to do so, partake of the labours and share in the pleasures of the family which has them in charge.

Of the many stories told to illustrate the tact of the Gheelois in dealing with those under their charge, I pick out the following:—

One *nourricier*, a cobbler, was keeping a patient who continually threatened suicide. After studying his boarder for some time, he said to him: "Look here, Yvon, you've talked of this so often that I am quite tired of the subject. I am persuaded that you are right, and that the best thing you can do is to try the window, since you are not satisfied with going out of the door."

"But I shall be killed!" exclaimed the lunatic, completely taken aback by the coolness of his host.

"Oh, that is your look out! See here, I'll help you as far as opening the window goes, but the rest you must do for yourself." The cobbler rose and deliberately opened the lattice.

"Now, Yvon, I am going down to dinner, so I'll say good-bye."

The lunatic looked at him a moment in surprise, and then calmly walked up and closed the lattice, remarking, "To dinner, did you say? Well, I don't mind if I dine too; I can do this afterwards."

Another case is told of a woman being threatened by her charge, who came at her brandishing a pair of scissors, intending to stab her. Holding up her child between herself and the madman, she made him retreat until finally he fell into a chair, whereupon the woman threw the child into his lap, and rushed out of the room. The little one, thus roughly treated, began to scream, and, the thoughts of the maniac being drawn from himself, he forgot his purpose and was heard a moment later soothing and pacifying the crying infant. Of course, the mother knew that her child was as safe with him as with a person in the full possession of his faculties.

**A FEW RIDDLES SOLVED.**—Feet have they, but they walk not—Stoves. Eyes have they, but they see not—Potatoes. Teeth have they, but they chew not—Saws. Noses have they, but they smell not—Teapots. Mouths have they, but they taste not—Rivers. Hand have they, but they handle not—Clocks. Ears have they, but they hear not—Cornstalks. Tongues have they, but they talk not—Wagons.

**TO TOBACCONISTS** (commencing).—*Illust. Guide*, 259 pages, "Post Free." How to Commence. £20 to £1000. Tobacconist's Outfitting Co., 136, Euston Rd., London. Manager, Hy. Myers. Est. 1868. Smoke "Pick-Me-Up Cigarettes."

## UPON THE COMPLEXION.

"WHAT a lovely colour!" We often hear this sentence from the lips of many of our young ladies when they behold the true rosebud of health upon the cheeks of their fair sisters. What a contrast to the waxy hue of the anæmic girl. Here the same exercise which brings the blood tingling to the cheeks of her companion means to her fatigue, weariness, and exhaustion. Indeed, she gets even paler under the ordeal, the blood leaves the lips and the muscles tire of the exertion. Have you ever considered what the difference between these two states is due to? No; probably not. And yet it is possible, and not difficult either, to replace the colour in the bloodless cheek, give redness to the lips, and energy to the muscles. Simply by the administration of iron—the natural purifier and life-giving principle of the blood. Do not think it can be done by Bland's pills, iron pills, and other insoluble compounds of iron, for these derange the stomach, or set up constipation, and the system cannot stand such rough treatment. Take, instead, two Bipalatinoids of Carbonate of Iron three times daily after meals. You can swallow these more easily than pills; they will not blacken the teeth like iron mixtures, and you will experience no inconvenience after taking them. Do this regularly for three weeks, do not despair, and in that time you will feel better, look better, and play better. On no account give up healthy outdoor exercise, but take it in moderation, and cease when you feel tired. Nourish the system by taking meat foods, and abstain from excess of pastry. "Early to bed and early to rise makes people healthy, wealthy, and wise" is an old axiom whose injunction is specially applicable to the anæmic. It will make them healthy; we cannot answer for the wealth and wisdom. A tablespoonful of plain Cream of Malt directly after a meal is a fine tonic, and should be taken in conjunction with the above treatment. Follow the rules laid down above, and the anæmia will quickly disappear.

## GLEANINGS.

THE LOST DINKELSPIEL.—The tricks of the absent-minded furnish an unfailing storehouse of humour, and the oddest feature of it is that there are so many "stock stories" on the subject. Have absent-minded people done the same things over and over again through all the ages, or have jokers simply copied or modernised the old stories? We have all heard of the man who forgot his own name and had to walk the street till he met a friend who addressed him by it; of the man who ran against a cow and said, "I beg your pardon, madam," and of the man who put the filled teakettle in his favourite easy chair and set himself on the hot stove, "and did not find out his mistake till he began to sing;" but the Germans have the best hero in that line, and his name is, or was, Dinkelspiel. Dinkelspiel was so absent-minded that he was forced to write on a slip of paper the position of his clothing on retiring, so that he could find it again in the morning. One night he made out his slip as usual in this style:—"Shoes on floor, trousers on chair," &c., and

finally, "Dinkelspiel in bed." On arising he found everything just where he had placed it, until he came to the bed. Horrors! it was empty. A strange fear overpowered the poor man. Had he been kidnapped during the night? It was evident since he was no longer in the bed. Hastily attiring himself he ran to the police headquarters to give the alarm. Dinkelspiel was missing, and he must be found. Terror at his awful fate completely unnerved him. He tottered home and went to bed, a prey to high fever. When the police arrived at the house to look up a clew they found Dinkelspiel in bed. The poor man's joy at being recovered can more easily be imagined than described.

THE PHYSICIAN AS HE IS.—Search the world over and nowhere is to be found a class of men so self-denying, or self-sacrificing of personal convenience and comfort, as are those of the medical profession. They minister to suffering and diseased fellow beings without stopping a moment to count the cost—the indigent pauper receiving the most careful and skilful attention as the most wealthy in the community. Neither hoping nor expecting compensation, he renders the service as gently and conscientiously as the priest ministers final consolation to the soul. The fact is not at all fully appreciated by the laity, some of whom complain of physician's exorbitant charges.

HOW MINERS LIVE IN CHILL.—The nine or ten thousand workmen in the copper mines of this country (Chili), says Francisco Perez in the *Vegetarian*, live upon wheat bread, haricots, dried figs, and buckwheat cakes. Meat eating is exceptional, and is placed quite beneath the vegetable diet. These miners are strong, anæmia is unknown among them, and they would be some of the finest specimens of humanity, were it not that they give themselves up to alcoholic excesses three or four times a week, and thus are subject to fevers and liver diseases. The experiment of giving them meat in place of a purely vegetable diet has been tried, with the result that they did less work; many of them were considerably debilitated, and from choice went back to their grains, fruit, and black bread.

## "LA MALADIE DES MEDECINS."

MUCH has been written upon the diseases of occupations. Whilst that insidiously progressive change in and around the vascular system which ultimately pervades, like the vessels themselves, every organ and tissue, and which has received the name of arterio-sclerosis, cannot correctly and exclusively be termed the disease of any given occupation, there appear to be reasons for believing that some forms of that ailment specially affect those who follow certain callings. M. Huchard, in his careful treatise on Diseases of the Heart, speaks of it as the disease of physicians, politicians, and financiers, and ascribes the special liability of these classes to their practising professions in which the factors of emotion and overwork have a wide influence. We need not here lay too much emphasis on the self-denial and hardships of the medical profession. It will be admitted that we have our share of those human heritages, and that we rarely eat the bread of idleness; our increment is duly earned, if not always punctually paid. Before the immediate factors in arterio-sclerosis come into play there are antecedent conditions, inherited or acquired, which may call into activity the vitiated metabolism which seems to be potent ultimately in promoting the vascular changes referred to.

The majority of those who adopt the career of medicine from some higher motive than the mere acquisition of means for sustaining life, and exercising the usual functions of humanity become members of an honourable calling ruled by tradition, and a largely unwritten, but, nevertheless, well-known code of honour. There is nothing more easy than to disregard the "rules of the game," and by methods which

we need not further particularise, to gain more or less wealth and, it may be, ease. "As a man sows, so shall he reap." "These, therefore, have their reward." With either their emotions or their overwork we are in no way concerned. The physician, on the other hand, who, having equipped himself for the responsibilities of his calling, has frequently to learn to wait after he has learned to labour, undergoes an ordeal in which one phase of emotion—i.e., suspense—has full scope for influence. Many a prematurely grey head is eloquent of such influence. When, moreover, what has been termed the "ignoble melancholy of insufficient means" has been survived, it is greatly to the credit of a large proportion of our brethren that they have sufficient heart left to be touched by the sorrows of those with whom their calling brings them in contact. Nor is the scope of their emotional nature left unexercised by the too-frequently observed ingratitude of patients. It is not that they regret the loss of remuneration under these circumstances, but that there is something in human nature which, having gone loyally out to aid the distressed, feels the pain of unmerited repulse keenly. Finally, the physician has his share of the joys and sorrows of his race, and shares also in the ordinary vicissitudes of fortune, feeling them perhaps more acutely because a considerable proportion of his class, like that of all the higher callings, is more or less of a neurotic type. These factors, no doubt, have some influence on that variation in, and over-activity of, the vascular system which predisposes to cardiac and vascular change.

When to these morbid causes we add that kind of overwork which the majority of our profession who are busily occupied have to undergo, we feel disposed to agree with M. Huchard when he regards arterio-sclerosis as specially liable to attack medical men. Apart altogether from irregularity in taking food, and the more fatal interruption of periodic rest, the hydraulic strain to which the active human body is submitted is frequently very great. In these days of demands for shortened hours of labour it is at times forgotten that the hard-worked practitioner is frequently continuously occupied for consecutive days and nights, a labour for which the human body was never intended, and which it cannot sustain with impunity. Before the final breakdown, however, the vessels seem to strive to emulate the heroism of the slave to inexorable duty or necessity, and undergo that fallacious increase of development—that arterio-sclerosis—which is the beginning of the end.

How is this vicious sequence of events to be arrested or avoided? Naturally by a diminution of anxiety and an avoidance of overwork. Speaking from experience, we feel the mockery of this lame conclusion. We do not by any means concede, however, that nothing can be done by medical men—and we refer, of course, to overworked medical men—to lead a more rational life than is sometimes done. The experience of life teaches us all sooner or later that the anticipation of pain or of pleasure is often greater than the reality, and just as the unexpected sometimes happens, the expected frequently does not. Much unnecessary worry may be avoided by a vigorous prosecution of the duty of the hour. "Sufficient for the day is the evil thereof."

The practitioner's holiday, again, is not to the majority a luxury, but a necessity, and except in obedience to the call of an unavoidable duty should never be postponed too long.

## THE CURE OF CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, & CATARRH. By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S., Late M.R.C.S. Eng., late Consulting Surgeon to the Lower Clapton Orphan Asylum, &c., Lynton House, Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous, I had no less than 60 cases of cure last year."

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch*.

**HUDSON'S EXTRACT OF SOAP**  
AND  
**HUDSON'S DRY SOAP.**

**RECOMMENDED**

For the preservation of lawns, laces, beautiful washing fabrics, underwear, fine linen, shirts, sheets, &c., HUDSON'S EXTRACT OF SOAP and HUDSON'S DRY SOAP are recommended. Instead of the offensive soapy smell common in many Soaps, HUDSON'S leaves the linen actually sweeter and fresher than when new.

The variation of days of toil by rational amusement, we need scarcely say, is highly important, but the amusement must be that of the worker who is pausing before renewed effort:—

To rule and at the same time follow pleasure—

A grievous error! he who would command  
Must in commanding find his happiness.

For the rest, as regular a repair as possible of the wasted tissues by an appropriate quantity and quality of food and an endeavour to avoid increasing in any way the labour of the over-worked circulation are rational indications in the preventive treatment of that form of arterio-sclerosis with which we are at present concerned.—*Lancet*.

## SURGERY IN THE KITCHEN.

### ONE WAY TO SAVE A DOCTOR'S BILL.

THIS little article has for its modest aim the designation to the busy bees of the kitchen, a few of the important, though often considered minor, points in the proper treatment of little wounds received during the fulfilment of the housewife's duties. There are dangers in neglecting even the prick of a pin. The germ theory and the antiseptic treatment of wounds have opened up a new realm to the M.D., and as the intelligence of the public grows, there is less need for a doctor from year to year. Will we ever be able to get along entirely without one?

What are the requirements of perfect wound treatment? Cleanliness first, last, and all the time. This is said to be the foundation of antiseptic surgery. How can we secure it? No germs can live or develop where there is extreme heat. When you injure yourself while cutting bread, scraping potatoes, sharpening your carving knife, or in any other way, procure immediately some previously boiled water into which you have thrown a few drops of pure carbolic acid, and after you have checked the bleeding, not by cobwebs, but by pressure, applied by means of a constricting band of rubber, or a twisted piece of cloth, wash the injured member in the carbolized water. Have always in the house some absorbent cotton, and some old, clean linen, which should be in strips from two to four inches wide, and from a half-yard to a yard long. After the wound has been made perfectly clean, dip some layers of cotton into clean carbolized water, and press out the excess of liquid, then apply over the wound, and wrap up with the linen strips. The wound will heal beautifully. A bottle of collodion, some ammonia water, and a vial of tincture of iodine should be in every house.

If the baby should be scratched by pussy, don't be contented with kissing away his tears, but in connection with affection, apply ammonia, and in a mild way cauterise with it the excoriation. Pussy's claws are not always clean, and dirt particles, however small, may give rise to trouble.

If Mary scalds or burns herself severely, make immediately a paste of carbonate of soda, flour, and water, and cover the burn with it completely. In a few days, perhaps a week, as burns heal slower than any other wound, the result of proper treatment will be seen, and perhaps a doctor's bill will be saved. Don't use linseed oil and limewater, as it becomes hard and encrusted over the tender surface, causing pain when it has to be removed; whereas the soda paste is delightfully cooling.

## RUPTURE.

Should Tommy knock his little nose severely enough to cause bleeding, have him snuff a pinch of powdered alum, and often it works like magic.

## OUR OPEN COLUMN.

### CORRESPONDENTS' OPINIONS.

#### WHITE HANDS AND GRACEFUL FIGURES.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I notice in this week's paper it is stated in the Editorial Column that good health is necessary even to have white hands and a graceful figure, besides a clear complexion, &c. I wish respectfully to prove the contrary. Near here there are at least seven members of our family who do not enjoy really good health. Chronic indigestion, lassitude, head-ache and tendency to colds is more or less common amongst the female portion, though the men have all robust health. Yet my sister-in-law and sisters have all undoubtedly slim, graceful figures, and in the majority of cases remarkably white shapely hands, though we can none of us boast of good complexions. Nice hands are only a matter of constant gloves—that is, if the nails are pretty by nature and well kept by the individual. We are all tall, and take great pains to keep our waists small by care in what we eat, and the constant wearing of low but very tight corsets. The looseness of our stays is to ensure a flexible, graceful carriage instead of the stiff, wooden appearance of very stiff, tightly-laced corsets. We have often been told, by doctors and others, that the excessive tightness with which we compress our waists has much to do with our constant indigestion and head-aches, also tending to spoil our complexions, though the care we take to keep out of the sun and wind has made them very smooth. Personally, I am vain of my hands, though my face is rather sallow, and apt to flush in the evening. My hands, from wearing gloves nearly all day, indoors and out, and always sleeping in them, are as white and smooth as wax, the veins never showing, even when I am hot. My waist is confined night and day, generally by a very tight belt at night. This is very painful at times, but I have the smallest waist in the family, though the tallest girl, and any sacrifice is worth making to keep myself in an inch smaller than the rest. My daughter of twelve has inherited the family love of slim waists, and does not complain, though I keep her buckled in with a broad belt day and night, her figure being quite moulded inwards already to a very small size, and spreading out at the hips. The end of each month I draw her in one hole tighter before she puts on her clothes, and keep the belt on four days and nights to accustom her to the pinching. Her hands are small and well shaped, and, being nearly constantly gloved, are getting as white as mine. Her complexion is not good, though she has a good appetite, and rides and walks some hours every day. IRISH BEAUTY.

#### HIGH HEELS AND TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I have been very much interested in the excellent letter of "Science and Art" on "Tight-Lacing and High Heels." My wife, who has naturally a good figure, has been induced by perusal of the correspondence to lace somewhat tightly; but fears of evil results have prevented her from doing so to the extent either she or myself would like, but the letter of "Science and Art," giving the experience of his wife, has convinced her that she could bear to lace much tighter (her present size is nineteen inches), but, as example in this respect is better than precept, would it be possible, without intruding on the privacy of either "Science and Art" or his wife, to arrange in some way so that a glimpse might be taken by the writer and his wife, of the dainty form, tiny waist, and high heels of "Moderation." BRIGHTONIAN.

#### LADIES' GLOVES.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—May I thank "Admirer of Pretty Feet," through your courtesy, for the interesting facts he mentions with regard to ladies' gloves. I think beautifully-fitting kid gloves might with every advantage be more generally worn. I regret not to have seen any replies respecting the wearing of kid gloves of perfect fit when being photographed, or any particulars or ideas thereon. I have myself lately photographed ladies wearing exquisitely-fitting black and fawn kid gloves with delightful results. I should be glad to hear of other experiences.

ADMIRER OF PRETTY GLOVES.

## GREY WHISKERS, &c.

To Permanently Restore the COLOUR in two hours,  
True to Nature, send for a bottle of

COURTICE'S CONCENTRATED  
EXTRACT OF NUT  
GALLS.

This is not a dye, is applied in two minutes, and does not stain the skin. Of all Chemists, or direct from GEO. COURTICE, 234, Strand, London. Post paid, 3s. 9d. To LADIES the EXTRACT is INVALUABLE for Restoring the Colour close to the skin, and can be used with any other restorer. Try it.

## BARE-FOOTED STROLLING AT EVENTIDE.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—Looking over some recent numbers of the FAMILY DOCTOR, I came across a very nice letter from "Jeannie," in which she wrote of the necessity of accommodating one's costume to the weather, and I not only quite agree with her, but would like to relate an incident which occurred almost about the time "Jeannie" was writing her letter.

It was one of the hottest and closest nights we had, and I happened to run round to see a married cousin and her sister. I was told they were in the garden, and as I approached, saw two figures—one lying in a small hammock, the other lazily fanning in a low chair. They both laughed as I came up, and I then saw that their high-heeled shoes and stockings were lying discarded on the grass, and I became aware that they were sitting bare-footed. They told me that when dark they often took advantage of slipping off their foot gear, as the long continued heat had reduced their feet to such a state of tenderness that the relaxation was such an intense relief, and they informed me that no more pleasurable sensation could be experienced during the oppressive evenings than a stroll with naked feet up and down the soft grass plot. Indeed, so comfortable did they look in their wrappers and bare feet, that I could not resist the temptation of slipping off my own somewhat high-heeled and pointed slippers, which were none too easy, and my stockings, and I eventually, though with many misgivings, joined them in a bare-foot promenade up and down the lawn.

I had never walked with bare feet before, but found it most pleasant, and though I had laughed at them at first, I became a ready convert to the practice, and even dared them to try the path, leading the way boldly myself until I came in contact with the first sharp pebble, and sat down with a small shriek on the soft grass to examine my sensitive bare sole. I believe in hot countries, such as South America, the ladies go practically bare-footed indoors on the polished floors and cool matting, and I often used to envy them the fashion during the tropical weather we have been experiencing, with our long-suffering feet buttoned up in tight high-heeled boots, or almost equally confining shoes. MABEL LEVY.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

I SHOULD be obliged if any correspondent would inform me whether Pinner, Watford, and Weybridge are suitable for a person suffering from rheumatism, but for whom a bracing air is necessary? Are they relaxing? Are houses and living fairly reasonable? Are they affected by London fogs?—*Asthma*.

WILL any reader kindly give a short description of three or four nice and healthy old-fashioned villages where rents of furnished rooms and living are cheap? I am an old gentleman in very reduced circumstances, and without relations, and I want to find a comfortable home with homely people, not too far from London—say within thirty miles.—*Phelps*.

GLYCEERIN AND CUCUMBER.—Will anyone kindly say how the lotion or cream is made, or whether cucumber lotion can be made without the glycerine, as it is for use in hot climate.—*Complexion*.

### ANSWERS.

INSANITY.—The executors of the will could not act because a will is never operative during the life of the testator. A committee will have to be appointed to manage the lunatic's affairs. You had better consult a solicitor, as the process is not easy for a layman to understand.

RATS.—Try arsenic, placed near their holes. It is said they are fond of this, and when they have eaten their fill become insensible, and so can be destroyed.

WATER RATE.—"Net annual value," for water rate purposes within the Metropolitan area, means the rateable value as defined by the Act for the valuation to the poor rate.

## WANTED. 5,000,000

MOTHERS, to insist on having their Babies' Toys and Feeding Bottles fitted with INGRAM'S NEW PATENT COLLAR OR RIM TEAT. They do not in the slightest degree irritate the most sensitive Gums, but, on the contrary, they have been proved to be the Best Soothing Teat ever invented. No

## BROKEN

Rest for Mothers or Nurses, and Father can now have the luxury of his evening paper in peace—without being constantly disturbed by the cries from the cradle; in fact, the whole home is changed to a haven of bliss through the introduction of INGRAM'S PATENT COLLAR OR RIM TEAT, No 22,458 on every Teat, and if the

## FEEDING BOTTLES

now in use are not fitted with this wonderful invention, a loose Teat can always be bought for a few coppers at your nearest Chemist.

## DUNN'S FRUIT SALINE

This PURE preparation is a quick relief for Sick Headache, and Derangements of the Stomach and Liver. Purifies the Blood, and is delightfully refreshing. Through Chemists and Stores.

SPECIAL OFFER.—To prove its efficacy, 1s. 9d. bottle will be sent post free for 1s. 6d. stamps. WORKS: CROYDON, LONDON.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

### ADVICE GRATIS.

BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS are REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

Hospital for Sick Children | London Hospital.  
St. Peter's Hospital. | Charing Cross Hospital.

G. B. B.—1. This is probably not connected with your other attack; although once you have had a constitutional disease every incident of ailment you get, is somewhat coloured with such. You had better take a little iodide of potassium for the trouble, say five grains three daily in water.

JACK, CONSTANT READER.—So long as you walk two hours a day we fear the chances of your complete recovery will be deferred. You ought to lie up for a week, and devote yourself to getting thoroughly well. In any case you had better wear a suspensory bandage and take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals.

PEBBY.—There is no objection to his smoking if he is accustomed. We should advise you to apply some white predigested ointment to the neck, and see that his bowels are kept freely open. Let him take the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, spirit of chloroform one drachm, peppermint water to six ounces. One sixth part three times a day.

SALESMAN.—It is quite possible the lime juice caused the diarrhoea, if you have taken too much of it, but you have not said how much you took, nor what else you have been taking by way of food and drink. With regard to your general condition, the probabilities are that you do not dress suitably, do not take enough exercise, or in some other way neglect your bodily health. This is a question which would take too long to go into here, simply because you have given us scanty information. Suffice it to say that you should not dress too heavily, which is not synonymous with warmly, the best clothing being flannel. Keep the bowels freely open, and take a quick cold or tepid bath every morning. We cannot give an opinion with regard to the tendency to rheumatism without examination. Why do you not see a physician? We shall be happy to recommend one.

UNFORTUNATE.—It is not very easy to give you the exact cause for this feeling, but it is probably connected in some way with the general condition of debility from which you are suffering. You had better follow out the advice we gave you in the former number of this paper for some little time. You must not expect to be quite well in a hurry. Your recovery will probably be protracted, and the medicaments varied now and again.

STOOPER.—The first thing to attend to is to keep the bowels freely open by means of a teaspoonful of compound liquorice power, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Constipation very often causes head-ache and general debility, when it is allowed to exist unchecked. You had better use lime water injections night and morning for the white discharge, and take a teaspoonful of Parrish's food three times a day immediately after meals. Eat plenty of good wholesome food, and get out much in the open air.

M. D. B.—1. Indigestion, due to sedentary life, is the source of your difficulty. You must eat your food slowly; take more exercise; avoid sweets; get a new set of teeth put in. Take twenty grains of bicarbonate of soda with three grains of carbonate of ammonia in half an ounce of bitter infusion three times daily after meals. To prevent valentism, keep the part always uncovered and washed every day.

ST. THOMAS.—Yes, every day. 2. A teaspoonful or more of sulphate of soda dissolved in water and taken each morning before rising. 3. Dilute phosphoric acid ten drops, tincture of nux vomica ten minims, water to half an ounce. Three times daily before meals. 4. No, nothing at all. 5. Zinc ointment and carbolic ointment, equal parts, to be used night and morning.

YELLOW S.—If you expect to obtain any relief from such rubbish as the homeopathic so-called remedies named, we are sorry for you. Homeopathy, as a system, is as effete as the dodo. In proper doses, belladonna might have helped you. We should, however, recommend you to try the effect of ten drops of pure roseberry (Murrell) on loaf sugar, taken three or four times daily. Let us know the result in a few weeks. Of course you must exercise ordinary care in the matter of diet and regulation of the bowels.

A FREE AGENT.—The cause of your trouble resides in the fact that you are given to lying on your back when asleep in bed. You should be careful to avoid this by refraining from stimulating drinks as much as possible, and keeping the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Abstain from sleeping on your back by tying a large cotton-reel or other body in contact with your back, so that when you turn on it the pressure will warn you. Take a teaspoonful of Parrish's food three times a day immediately after meals.

BENDIGO.—You have not informed us what your occupation is so we have not been able to discuss what part this may have in the feelings you describe. But you are not suffering from nervous debility. Your symptoms are rather those of a constipated habit or an engorged liver. We should advise you to give up drinking so much stout—it is better for you to drink ordinary plain mineral water. Take the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia two drachms, syrup of ginger two drachms, chloroform water to six ounces. One-sixth part three daily.

ONCE ALARMED.—You have omitted to state whether your occupation is likely to have affected the head locally. But, in any case, the probabilities are that you have some hereditary tendency to loss of hair, and hereditary tendencies are not amenable to the attack of drugs and medications. You should look after your general health, live as well as possible, and take a teaspoonful of Parrish's Food three times a day immediately after meals. Use the following hair wash: Spirit of rosemary three drachms, dilute acetic acid one-and-a-half ounces, tincture of cantharides one drachm, tincture of nux vomica two drachms, tincture of capsicum one drachm, aqua mellis two drachms, rose water to eight ounces. To make a lotion to be used every night and morning.

## RISE SUN STOVE Easiest, Quickest, Cheapest, & Best.

NOTE.—You can produce MORE POLISH with TWO Penny Packets of the "RISE SUN" than with HALF-A-DOZEN Penny Packets of ordinary Blacklead.

## RISIN' SUN METAL Polish.

LIQUID, IN BOTTLES, 6d., 1s., and 2s. 6d. GIVES WITHOUT LABOUR A BEAUTIFUL, SOFT, BRILLIANT, AND LASTING POLISH, ENTIRELY FREE FROM SCRATCHES, TO ALL KINDS OF METAL ARTICLES.

## MACK'S DOUBLE STARCH.

Contains RICE, STARCH, BORAX, GUM, WAX, &c., as well as the STARCH GLOSS. Saves TIME, LABOUR, AND UNCERTAINTY, as in it are combined in their PROPER PROPORTIONS, all ingredients necessary to produce BEAUTIFUL WHITE GLOSSY LINEN.

## CHANCELLOR'S PLATE POWDER

3d. PER BOX. Samples of the above four articles post free for eight stamps, or of any one for two stamps (to cover postage). Name this over.

C. CHANCELLOR & CO.,  
13, CLERKENWELL ROAD, LONDON, E.C.

HERODUS.—We are, of course, quite unable to give an opinion as to whether there is anything the matter with you or not. If you wish to be sure, the best thing you can do is to go somewhere and be examined. You need not say anything about your history unless questioned, in which latter case it would be better to speak veraciously. If you like to send a stamped addressed envelope we can advise you to see someone in the neighbourhood or elsewhere, just as you please.

INITIALS.—We think that, with your long catalogue of complaints, it would be far more satisfactory for you to see a medical man. It would be impossible for us to advise you without knowing first whether you were physically healthy or not. Your symptoms may be purely functional or due to organic mischief. Much better see a good medical man.

SOMETHING WRONG.—We are disposed to agree with you that there is more nervousness than anything like disease in your case. There are not any symptoms, and as far as your letter goes no evidences of any malformation. The only satisfactory method of deciding the matter, however, is that of consulting a specialist physician who can examine the parts and give you a definite opinion upon what he finds to be the state of things.

DECEMYERS.—See answer to "Callao" and the next correspondent in these columns. You must give up all bad habits at once: take as much fresh air and exercise as possible; keep the bowels acting regularly; never lie on your back—a knotted towel tied round the waist will prevent this. Rise to pass water as soon as you wake in the morning, and endeavour to direct your attention to other than sexual subjects.

NEMO.—The cause is general weakness, and the remedy is bracing up the general health and raising the strength and tone of the body to as high a standpoint as possible. Look after yourself in respect of your food, exercise, due attention to bowels, &c. You do not state what your occupation is, hence we cannot advise you on that matter. You should take a teaspoonful of Parrish's Food three times a day immediately after meals.

UNFORTUNATE.—No medical man can, or pretends to, guarantee a "cure"—that sort of thing we leave to the quacks. You had better take a cold bath every morning, and keep the bowels freely open. Refrain from all beer, wine, or spirits in any shape or form whatever. Avoid much walking or standing about, and take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, pancreatin ten grains, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals.

JUNO.—There is undoubtedly a method of getting you well again, but we cannot enter into detail in these columns on the matter. Send a stamped addressed envelope, repeating the information, and we will advise you.

CALLAO.—Take the following medicine night and morning: Bromide of potassium twenty grains, carbonate of ammonia three grains, infusion of gentian to half an ounce. Take as much outdoor exercise as possible, keep the bowels regular, and avoid any indulgence in impure thoughts. You have not asked any questions; is there anything else you wish to know in connection with this matter?

C. W. P.—The apparatus named would be useless in your case, and the treatment would be of as much value, inasmuch as the persons who would administer it have neither experience nor knowledge of these matters. Take the mixture recommended for "Callao" three times a day, and learn to pass (twice a week) a gum-elastic bougie (No. 10 English). The chemist will tell you how to manage this. Of course you must bathe the parts with cold water every day: never sleep on your back; always rise to pass water on waking in the morning; eat no late suppers, and take no fluid after 6 p.m. In addition you had better dissolve one teaspoonful of Epsom salts in half a wineglassful of water, and take it each morning before rising.

THOS. HODGKINSON, PRESTONS, & KING,

81, BISHOPSGATE STREET WITHOUT, E.C.

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—Daily Chronicle.

**BIRKEN.**—It is a mistake for you to go and see any one who advertises in the papers. A qualified registered medical man is allowed to advertise at all. The best thing you can do is to see a well qualified specialist on the matter.

**NEMESIS.**—The probability is that you sleep on your back. Avoid this by tying a cotton reel round your waist in contact with your back, so that when you lie on your back the pressure will wake you. Be careful to keep the bowels freely open, and do not indulge in stimulants the last thing before going to bed.

**MORPHEUS.**—We cannot answer you as fully as we should desire on account of the character of your malady. You should use plenty of cold water and soap, and let cleanliness, thorough and continuous, be your rule, with regard to these matters. You should avoid drinking any beer, wine, or spirits, and be careful to keep the bowels thoroughly well open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. You can no doubt get well if you go to a proper specialist in these matters. In the meanwhile you should take a teaspoonful of Parrish's Food three times a day immediately after meals.

**HALLOW.**—You should take a cold bath every morning and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and followed the next morning by a mild dose of aperient fruit salts. Take plenty of active outdoor exercise, but not walking or cycling. Pay due attention to the character of your meals; let them be plain and nourishing and taken at regular hours. When you go to bed at night, be careful to evacuate the bladder the last thing, and then see that you do not sleep on your back. This can be prevented by tying some hard substance in contact with it so that the pressure will wake you up. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

**LITTLE'S EYE.**—Under the circumstances, we do not think the little patient has done at all badly, and as far as we are able to judge your method of feeding is fairly satisfactory. The teething is probably responsible for his present flabby condition, for he has other four double teeth to cut within the next five months. You may try a teaspoonful of Gannick's cod-liver oil milk three times a day. Use a tepid bath daily, followed by a brisk rub down with a soft towel, and give the following mixture at bedtime: Bromide of potassium four grains, syrup of oranges half a drachm, camphor water to one teaspoonful. Frame Food will be very suitable for him, a little later on.

**NELLIE BLY.**—This peculiar feeling may be due to the stomach and liver being out of order—in fact, to indigestion. We should advise you to be particular about taking a due amount of exercise during the day, and be careful to keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. We think that you would be well advised to defer what you call your tea until seven o'clock, and make an addition of some meat or fish to it. Moreover, you drink too much tea; why not take a glass of ale with your last meal? Take also the following medicine: Bicarbonate of soda one and a half drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day.

**J. C.**—Too much meat, too many eggs, too much bread and butter. Moderate these things as regards quantity; take a longer time for eating them; drink only after meals. Each morning before rising take a dose of Aescular water; wash the face only with hot water, and be particularly careful to use only the best soap.

**AFTERWIND.**—Yes. Precisely the same thing.

**W. MURRAY.**—We have replied to you by letter as requested. **J. K. S.**—1. The band would be a mistake. The only method of getting over this difficulty, is by means of a slight operation, but this is scarcely necessary except in extreme cases. Keeping the ears well inside the head covering, will do all that a band could accomplish, and will be infinitely more agreeable to the patient. 2. The range of motion of the arm, between nine and fourteen pounds, would be fairly accurate. There is no rigid rule for that age.

**WILTON.**—Give up your beer, porridge and whiskey. Take more fresh vegetable with your meal, give up sugar and coffee. Take fresh fish, fresh meat or poultry, and as much greenstuff as possible. Drink lemon-juice and water only. Every morning before rising, dissolve a teaspoonful of sulphate of soda in a wineglassful of water; after swallowing this, rest upon your back for fifteen or twenty minutes in order to avoid the feeling of qualms which sometimes follows.

## SELLERS' CLEANSING AMMONIA is a

perfect boon to every household. A little added to the Bath softens the water, cleanses the skin, promotes health and vigour, and secures all the benefits of a Turkish Bath without any risk or inconvenience. It is most refreshing for Toilet use, and makes a splendid wash for the Hair. For Laundry use it saves Soap, Soda, and Labour, prevents flannels shrinking, and makes Linen as white as snow. In bottles, 6d. & 1s. each, with directions for use. Sold by Chemists, Grocers, &c., or from J. SELLERS, 57, Farringdon Road, London, E.C.

## "NO USE TO GO TO CHURCH."

THOMAS LOCKYER says—"I was so deaf that I could not hear St. Thomas's Bells (a very powerful peal), and as to going to Church, it was no good at all, for I could not hear a word. After using 'Orchard's Cure for Deafness' I was quite restored, and last Sunday heard every word at Church."

# HAIR

DRAPER, ORGANNETTE WORKS, BLACKBURN.

DRAPER, ORGANNETTE WORKS, BLACKBURN.

**PEAR HILL.**—What she probably requires is iron; it is of no use taking it only for a time, it should always be taken. Constipation should be strictly guarded against by means of a teaspoonful of compound liquorice powder taken every night at bedtime, followed the next morning by a mild dose of aperient fruit salts. If there are pains in the stomach, not too much fruit, but light, digestible food, such as plenty of milk with bread, arrowroot, rice, and a little fish. Take the following medicine: Subnitrate of bismuth one drachm mucilage three drachms, chloroform water to six ounces. One sixth part three times a day immediately after meals. You may take a three grain Bland's pill with each dose of the medicine.

**JAMES KIREMAN.**—You had better take the following pills for a month, and write again. Green iodide of mercury, one grain, extract of gentian one grain. To make one pill. Take one night and morning. Avoid smoking, and drinking spirits while your throat is bad, or you may not get it better.

**H. CLARKE.**—We fear we cannot tell what this smell is due to. Odorous changes frequently take place in the direction corresponding to changes in food. The best thing for you to do is to go and see some good medical man who can examine the urine. With regard to your feet you should use comfortable and pliable boots or shoes, and thick woolen socks. Cold water washing will also relieve them.

**STOMA.**—Give up the habit of taking laudanum at once—it is almost as pernicious as the other habit, and is largely responsible for your loss of memory. By all means go for eye-lying. It will do you good as long as you do not ride to excess. Bathe the parts with cold water twice a day, and take the following mixture: Bromide of ammonium twenty grains, tincture of hops half a drachm, tincture of gentian half a drachm, water to half an ounce. Twice daily, night and morning.

**JOHNNY BULL.**—1. The best thing for you to take is milk, and plenty of it. We should not, however, advise you to try and get too fat, as you are very young, and may quite possibly later suddenly develop proclivities to stoutness. 2. Once a week. 3. No. 4. Yes, fairly, but it is not absolutely so.

**AMERICAN TRAVELLER.**—If you are a woman, it must be thoroughly washed every day, and every individual hair must be attended to by combing. White precipitate ointment, or oil of turpentine will destroy the living insects. If you are a man, have the hair cut off. We suppose you mean acid indigestion—all digestion in the stomach is acid. Yes, the prescription you give will do very well.

**MANCHESTER.**—You had better scrub this off with some pumice stone, or apply some sulphurous acid lotion to the part that is discoloured. It is due to a vegetable parasite called "Microsporum furfur."

**DOM.**—We cannot supply you with a cure for a bad habit; this is beyond the reach of mere drugs. You must make up your mind to conquer the habit, by directing the current of your thoughts to other and better subjects. Be careful to take plenty of active out-door exercise during the day, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Have a cold bath every morning, and eat plenty of good nourishing food. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

**CHESTER LANE.**—There are no particular rules of diet to follow, provided your meals consist of ordinary plain roast or boiled with vegetable, and some plain made-up dishes, each other substances, sauces, confectionery, &c. The usual medicine recommended is something that acts as a solvent. Neutralise one and a half ounces of bicarbonate of potassium with one ounce, twenty-four grains of citric acid in twelve ounces of water, and take a sixth part three times a day.

**MICAWBER.**—You must not think about this blushing facility of yours. There is no reason why you should not blush, so far as that goes; a blush is a curiosity now-a-days, and should be duly valued. If you look upon this blushing as a natural thing, which it is, and not as a token of some concealed guilt, you will soon cease to blush. Anyhow, the treatment is moral, and not medicinal.

**LOUIS BAILLOW.**—You had better communicate with the matrons of two or three hospitals and ask if they have vacancies.

**SAILOR JACK (Belfast).**—Your chest measurement is small in relation to your stature, but we are inclined to attribute your troubles to indigestion with pleurodynia as a complication. Take four grains of carbonate of ammonia, fifteen grains bicarbonate of potash, half a drachm compound tincture of cardamom, half a drachm tincture of gentian, in half an ounce of cinnamon water, three times daily after meals.

**PEDRO.**—The mere passive condition of the parts is no guide whatever as to their capabilities or otherwise, so that softness or hardness, &c. go for nothing. We should advise you to take cold baths every morning, keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Eat plenty of good nourishing food at regular intervals, and take a teaspoonful of Parrish's Food three times a day, immediately after meals.

**ANNIE SWIFT.**—You are suffering from chronic indigestion, which is responsible for the pains in your side and all the other troubles. It has been aggravated by your mistaken dietary. You must give up your tea and bread-and-butter as an all-sufficing food: take it once a day only. Eat a good meat meal in the middle of the day, with a sufficiency of fresh green vegetables. A glass of good red wine with your dinner will do you good, and you will soon get accustomed to it. After every meal a dose of the following mixture will be of service to you: Bicarbonate of soda twenty grains, sulphate of soda twenty grains, tincture of cardamom half a drachm, infusion of gentian to half an ounce. You may dilute each dose with an equal quantity of water without impairing the efficiency of the medicine.

**Y.**—There is no objection to your using this embrocation if it has done you good before. Wrap up the foot and ankle in some cotton wool after using it so that the part may be kept thoroughly warm. Hot foot baths may be found beneficial, especially if there be a little soda in the water. If you are in the habit of drinking beer, you had better discontinue it for a while, and take whiskey instead. Internally, sixty grains of salicylate of soda in a six ounce bottle of water. Shake up well, and take a sixth part for a dose three times a day. Attend to the proper regulation of the bowels.

**COMPLICATED.**—There does not appear to be any special complication about your case. The conditions described are only too common in this and other civilized countries. Take the following powder on alternate nights until three have been taken: Calomel two grains, scabium five grains, compound jalap powder, twelve grains. Take also the mixture recommended for "Sigma," and follow the directions given in his case.

**RESISTANCE.**—See reply to "A Long Sufferer, (G.S.)." and follow the directions given to him. Bathe the parts twice a day with cold water, and learn to pass a gum-elastic bougie —No. 9 English—twice a week, keeping the instrument in position for at least two minutes on each occasion. You are very nervous, which would account for the difficulty described, especially in public places, but there is really nothing so serious as to necessitate constant worry. Do not forget to make certain that the bowels are acting freely.

**SPERO.**—You had better continue the administration of the pill already prescribed for you for a month, and each morning take a tea-spoonful of Glauber's Salts dissolved in a wineglassful of water—not by preference. We see no reason to alter the diagnosis already given. The change of symptoms is confirmatory, and proves that the medicine is acting gradually upon your system. You must, of course, be careful in the matter of diet and drink.

**X.**—We do not think it would be wrong to marry a person younger than yourself. How should you be too old? A woman never ceases, &c.

**DEBILITATED ONE.**—1. You should long ago have consulted a specialist for the disease of the nose. You say there is already a perforation of the septum, which indicates that the trouble as advanced to a much greater extent than should have been allowed. We cannot—not having seen the part—tell you whether complete cure is possible. 2. Take ten grains of iodide of potassium in half a tumblerful of water three times a day. Persevere with the douche, using it twice a day. If there is no progress after two weeks, make up your mind to see a reliable surgeon at once. 3. Half a drachm of syrup of iodide of iron in a wineglassful of water after each meal. Keep the bowels regular, and avoid risk of exposure to draughts or damp.

**NIL DESPERANDUM.**—See reply to "Long Sufferer," adopt the advice of, and take the medicine prescribed for him. There is nothing uncommon about the case, and in all probability you will soon be well again.

**MOSS ROSE.**—1. For the present, you must not take any stronger medicine than compound liquorice powder or castor oil. Later on, when you are better after the confinement, if you write to us describing your condition, we will prescribe a stronger medicine. If there is no progress, we will prescribe probably will sufficiently account for these troubles. Again we must ask you to repeat this question after the event. 3. Probably caused by pressure of the foetal head upon some branches of the sacral plexus of nerves within the pelvis. Try resting on the opposite side of the body, or even upon the stomach for short periods. Not all the embrocations in Christendom will relieve this pain. Presently it will disappear.

**CROWWELL.**—See reply to "Uneasy," and follow the directions given to him. Yours are however external, and not internal piles. You may therefore bathe the parts after each motion with cold water and use the suppository immediately afterwards.

**EMMA.**—Baby is suffering from the effects of improper feeding. Be careful that bottles and tubes are thoroughly cleaned after each meal; let the interval be three hours, the proportion of milk to water be two parts of milk to three of water; do not try any of the fanciful foods, and be careful to add a small proportion of sugar, as salts to each feeding. Give a few grains of glycerine powder with one grain of carbonate of magnesia, every morning for ten days. Then write again. The name of the condition is gastro-intestinal catarrh.

**A LONG SUFFERER, G. S.**—Your liver is out of order, and, in addition, you are suffering from hysterical tetany. Try hot water to the back of the head and neck; take as much exercise as possible; eat your food slowly, and at regular intervals; drink no stimulant, and add no sugar to your food at any time. Take the following medicine three times daily: Carbonate of ammonia three grains, bromide of ammonium fifteen grains, syrup of oranges half a drachm, tincture of bark half a drachm, water to half an ounce. Keep the bowels acting regularly with liquorice powder.

**UNEASY.**—You are suffering from internal piles, and in moderation the bleeding is rather a relief than otherwise. Your first care must be to keep the bowels acting regularly and freely, a nightly dose of compound liquorice powder will accomplish this. You can also pass each night, as far as possible into the bowel, a suppository containing tannin four grains, extract of opium quarter grain, oil of theobroma as much as will be sufficient to make a suppository. Your sedentary occupation is to a large extent accountable for the trouble.

**M.P.**—We do not think the condition in any way dangerous. It is, however, an indication that your urine is acid, and that in its turn is dependent upon certain other conditions. Drink no stimulant, coffee, or sugar, eat little or no meat, and take the following medicine: Bicarbonate of soda twenty grains, sulphate of potash twenty grains, tincture of henbane half a drachm, infusion of buchu to half an ounce. Three times daily between meals.

## THE MAN WHO BROKE THE BANK AT MONTE CARLO.

-----

Did he, or did he not?-this is a point upon which the minstrel is dumb. If he did, when?-if he did not, then why not? Because if he did, there must have been a reason; and if he did not, then the omission was unreasonable. On the whole we are led to believe he DID, at lucid intervals, especially to prepare himself for the night he broke the Bank at Monte Carlo. There would be no difficulty in the way, they can be purchased at all Druggists there and everywhere; and this suggests another inquiry.-If more people did, might not the bank at Monte Carlo be more frequently broken with impunity?

As for the reason, it was reported that this man worked by a system. Now, the system works the man, and BEECHAM'S PILLS work the system. The man who broke the bank at Monte Carlo knew a great deal. When a thing was Worth a Guinea a Box, he was likely to keep his eye on it, and when a Guinea's worth could be had for about a Shilling, twenty to one he would "get on." At all events this is a safe speculation:-you break the box and nothing else. There is no gambling about the investment, the gambolling comes on afterwards; so think of your head in the morning and be in time with precautionary measures. Extravagance and over-indulgence need antidotes, so what more natural than that he should buy the Pills (he could not buy the patent) that would give him the clear head needed. One thing however, seems certain, that for the present he is not to be numbered among the mighty army who yearly swallow the contents of 6.000.000 boxes.

## EDITORIALS.

**TO CURE SLEEP-WALKING.**—A correspondent, commenting on an instance in which a sleep-walker was killed by falling from the roof of a house, says:—Such accidents can be easily prevented by laying upon the carpet by the side of the sleep-walker's bed a strip of sheet metal—iron, zinc, or copper—so wide and long that when he puts his feet out of the bed they will rest upon the metal. The coldness felt will waken him thoroughly, and he will go to bed again. A friend broke up the habit of sleep-walking in his son by placing a strip of wet carpet by the side of his bed.

**ALL** the blood in the body makes the entire round of the circulation in twenty seconds, so that three times in every minute all the red globules of the blood, which are the oxygen carriers, must each have its fresh modicum of oxygen.

**TO KEEP ICE FOR THE SICK.**—Cut a piece of clean flannel (white is best) about ten inches or more square. Place this above the top of a glass pitcher, or even a tumbler, pressing the flannel down half way or more into the vessel. Then bind the flannel fast to the top of the glass with a string or piece of tape. Now put the ice into the flannel cup and lay another piece of flannel, five or six inches square, upon the ice. Arranged thus, ice will keep many hours.

**A CURIOUS METHOD OF TAKING FOUL AIR OUT OF A WELL.**—I saw, said a correspondent, a curious method used the other day to take the foul air out of a well. The well was to be cleaned, but the man that took the job was afraid to go down until he had ascertained the quality of the air at the bottom. He let down a lighted candle, and when it descended to about six feet from the bottom it went out as suddenly as though extinguished by a whiff of air. That was all he wanted to know. He was sure it had poisonous gas in it, and took a small umbrella, tied a string to the handle and lowered it open into the well. Having let it go nearly to the bottom, he drew it up, carried it a

few feet from the well and upset it. He repeated this operation twenty or thirty times, with all the bystanders laughing at him, then again lowered the light, which burned clear and bright even at the bottom. He then descended to explain that the gas in the well was carbonic acid gas, which is heavier than air, and therefore could be brought up in an umbrella just as though it were so much water. It was a simple trick, yet perfectly effective.

**HOW TO REST.**—To understand the way to rest is of more importance than to know how to work. The latter can be learned easily; the former it takes years to learn, and some people never learn the art of resting. It is simply a change of scenes and activities. Loafing may not be resting. Sleeping is not always resting. Sitting down for days with nothing to do is not restful. A change is needed to bring into play a different set of faculties, and to turn the life into a new channel. The man who works hard finds his best rest in playing hard. The man who is burdened with care finds relief in something that is active, yet free from responsibility. Above all, keep good-natured, and do not abuse your best friend, the stomach.

**QUACKS.**—A quack is a man who boasts that he can do what he cannot do. He is a pretender, a liar, a cheat, seeking money without giving an equivalent. Quacks may have diplomas or they may not. Professor Huxley has a word to say about protection from quackery, which is interesting:—"A large number of people," he says, "seem to be of the opinion that the State is bound to take care of the general public, and see that it is protected against incompetent persons and quacks. I do not take this view. I think it is much more wholesome for the public to take care of itself in this as in other matters." This brings up the question of self-help. Professor Huxley is of the opinion that the race is weakened by too much guidance, too much protection. That there is far less danger of people going wrong if left free, than when opinions are made for them by others.

**SINGULAR INSANITY.**—Professor Alfonso Carpentieri, the famous gynecologist of the University of Naples, became suddenly insane a few weeks ago. He imagined that he was dying from starvation and thirst, and entering a restaurant drank four cups of coffee, a bottle of wine, a bottle of cognac, and ate fifteen sandwiches and more than a dozen eggs. When the proprietor declined to serve anything else the professor sprang on the table and cried, with the voice of Stentor: "Eggs, eggs! give me eggs, and keep me from starving!" When he began to break chairs and tables he was overpowered and placed in a hospital. He is one of the most famous physicians in Italy.

**THE SECRET OF WARM FEET.**—A life insurance company, whose advice under the circumstances may be taken as sincere, tells its clients that the golden rule in cold weather is to keep the extremities warm. The first and most important rule for the carrying out of this idea is never to be tightly shod. Boots or shoes that fit closely prevent the free circulation of the blood by pressure; but when, on the contrary, they do not embrace the foot too firmly, the space left between the shoe and the stocking has a good supply of warm air. The second rule is never to sit in damp shoes. It is often supposed that unless shoes are positively wet it is unnecessary to change them while the feet are at rest. This is a great fallacy, for when the least dampness is absorbed into the sole in its evaporation, it absorbs the heat from the foot, and thus perspiration is dangerously checked. This can easily be proved by trying the experiment of neglecting the rule. The feet will be found cold and damp after a few minutes, although on taking off the shoe and examining it, it will appear to be quite dry.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

**FACE AN INDEX IN HEALTH AND DISEASE.**—Incomplete closure of the eyelids, rendering the whites of the eyes visible during sleep, is a symptom in all acute and chronic diseases of a severe type; it is also to be observed when rest is rendered unsound by pain, wherever seated. Twitching of the eyelids, associated with the oscillation of the eyeballs, or squinting, herald the visit of convulsions. Widening of the orifices of the nose, with movements of the nostrils to and fro, point to embarrassed breathing from disease of the lungs or their pleural investment. Contraction of the brows indicates pain in the head; sharpness of the nostrils, pain in the chest; and a drawn upper lip, pain in the abdomen. To make a general rule, it may be stated that the upper third of the face is altered in expression in affections of the brain; the middle third, in diseases of the chest; and the lower third, in diseases of the organs contained in the abdominal cavity.

**ONE OR TWO IN A BED?**—Persons often ask: "Is it healthful for two persons to sleep in the same bed?" This same question is varied thus: "Is it healthful for an aged and a very young person to sleep together? If not, which suffers most, the aged or the young person?" We have always answered these questions by saying "no" to the first question. It is always unhealthful for two persons to sleep together in the same bed, and under the same covers. The air under the bed-covers immediately surrounding the body of the sleeper is exceedingly impure, becoming more and more impregnated with poisonous substances escaping through the excretory glands of the skin, from the moment the person retires until he arises. The odour of the bed-clothing, after having been occupied for a night, is often positively offensive to the nostrils of a person with an unimpaired sense of smell—especially one who has just come in from outdoors, where the fresh, pure air has been breathed. The poisonous character of this under-the-bed-clothes air would be somewhat more likely to affect the susceptible constitution of a child than that of an adult. In elderly persons, the amount of the impurities in the air surrounding the sleeper, must be greater than in young persons, consequently, while both persons would be more or less injured, the proportion of harm would doubtless be greater to the young person than to the person of more advanced years. Mr. Treves of the London Hospital, has recently called attention to the fact that wounds, especially of the lower limbs, heal much sooner when kept exposed to the open air, instead of being covered by bed-clothing. He remarks that the air under the bed-clothing is foul and almost hot, and hence likely to be very harmful to wounds with which it may come in contact. This seems to be a very ample demonstration of the correctness of the views above expressed, and to which we have before often given expression.

ONE of the most curious things about the Vaccination Law that renders it liable to ignorant abuse is, that it is compulsory to vaccinate an infant before it is three months' old, and just before the time that rachitis, and several other infantile ailments, show themselves, so that the mother who has previously had what appeared a healthy baby, finding it soon after vaccination sickly, promptly blames vaccination for its condition, whereas it is frequently due to rickets, and this only. Infants do not take small-pox so readily as children, although children, like pregnant women, suffer most severely from it. The mortality of infants (first twelve months) is very high, and there does not seem any very sufficient reason, if vaccination is compulsory, for insiting on the operation before twelve months of age. Vaccination law, like the collection of the income-tax, is open to the suspicion in the case of an over-zealous vaccination officer, and a surgeon, who is paid from public funds by the case, that many a sickly, perhaps not actually diseased, child, is hurried to its grave by too much zeal, for, at best, whatever may be the good that accrues in prevention, you are introducing a disease into the child's tissues which is uncertain in its results, and the extent to which it takes, and which certainly must weaken the infant somewhat.

DOMESTIC SURGERY.

USEFUL FOR THE HOUSEWIFE.

Written and Illustrated by a SURGEON.  
(See Frontispiece.)

PART II.

**B**ANDAGES are of such universal importance and utility that one cannot be too familiar with their use or too expert in their application. In our hospitals it is made an especial branch of the student's education, to whom it is essential; and nurses are expected to acquaint themselves with the different methods of bandaging, as prescribed for any particular part of the body or limb; and the difference of a well-applied and a badly-applied bandage is so great that it is only too noticeable—the one being smooth and fitting, whilst the other hangs loose and comes undone, or slips about, and the limb may be more injured than benefited by such a clumsy appliance. A common fault with beginners is either to put on the bandage too tightly, or else too loosely. The first causes a hindrance to the circulation, and the second is practically useless. The pressure must be uniform, and each layer must overlap its predecessor by at least one-third of its width.

Roller bandages may be any length and any width, according to the part for which they may be destined. For the arm or head they should be quite six yards in length, and about two inches wide, care being taken to tear off the selvage, and roll firmly; the harder the roll the better.

The operator should stand in front of the patient, and take the roller in one hand, and the loose end in the other, and apply it to the limb with the back or outer surface against the skin. The bandage end should first be fixed by a turn or two round the limb, and then you proceed to work upwards. When the limb is of uniform thickness a simple spiral is sufficient, but when the limb begins to get thicker, as of the calf, the bandage must be folded, as in Fig. 9. This is done by placing the thumb of the left hand on the upper edge of the bandage where the fold is to take place, and fixing it against the limb; then by a dexterous twist of the roller, hanging loose from the thumb, the fold is made, and by making it in the same line each time the bandaging has a more uniform appearance, and looks neater and more workmanlike than it would otherwise do. Over joints the bandage must be applied in a figure of eight—Fig. 13.

The capiteila bandage is exceedingly useful for keeping dressings on the head. It is made by rolling up each end of a bandage until the two rolls meet in the middle.

The operator stands behind the patient, and holds the two rollers one in each hand; and applies that part of the bandage between the two rollers to the forehead low down on to the eyebrows, and then brings both rollers to the back of the head, as low down as the ears will permit. The bandage in the left hand is now to cross the other and be transferred to the right, whilst that in the left is brought directly over the top of the head to the forehead again, and the other roll, having a twist around it at the back, comes round back again to the forehead, and then continues round and round, whilst the other goes backwards and forwards, as described in Fig. 11, giving a perfect caplike appearance when completed.

For finger bandages, two yards are long enough, and three-quarters of an inch is wide enough.

Fix them with a couple of turns round the wrist, leaving out a loose end (Fig. 12); now take it across the back of the hand spirally up to the tip of the finger, back down the finger across the back of the hand, and fix with the loose end at the wrist.

There are many other forms of bandaging that may be used in special cases, but as they will generally be under the charge of a surgeon no instruction in applying them will be neces-

sary, those we have already given being sufficient for almost every ordinary purpose. Having applied a bandage with care and precision, if it is likely to be required to remain undisturbed for a few days, as for fractures, it is advisable to secure the edges from slipping by a few stitches of thread, because the swelling may go down, and the bandage will then get loose as the size of the limb diminishes. A little practice will soon make the bandager perfect.

(To be continued.)

A TABULATED VIEW

OF

ERUPTIVE, INFECTIVE, AND

CONTAGIOUS DISEASES.

NAME.	PERIOD OF INCUBATION.	TIME OF ERUPTION.	DURATION OF ERUPTION.	CONTAGIOUS PERIOD.	PERIOD OF QUARANTINE.
Scarlet Fever.....	6 days.....	2nd day of fever.....	5 to 10 days.....	6 weeks.....	14 days.....
Measles.....	10 days.....	4th day of fever.....	5 to 10 days.....	20 days.....	18 days.....
Rotheln.....	10 days.....	2nd day of fever.....	3 to 5 days.....	10 days.....	15 days.....
Mumps.....	14 to 25 days.....	.....	.....	3 weeks.....	25 days.....
Whooping Cough.....	10 days.....	.....	6 weeks duration.....	6 weeks.....	42 days.....
Chicken-pox.....	4 days.....	2nd day of fever.....	7 days.....	3 weeks.....	21 days.....
Small-pox.....	10 to 14 days.....	3rd day of fever.....	14 to 21 days.....	6 weeks.....	45 days.....
Diphtheria.....	5 days.....	.....	.....	6 weeks.....	12 days after.....
Typhus Fever.....	12 days.....	7th day of fever.....	21 days.....	28 weeks.....	30 weeks.....
Typhoid Fever.....	14 days.....	14th day of fever.....	20 days.....	6 weeks.....	42 weeks.....
Erysipelas.....	7 days.....	2nd day of fever.....	Indefinite.....	To end of exanthum.....	After eruption is gone.....

Some variations may be observed from the above mentioned. Under certain conditions the eruption may be delayed, lengthened, or shortened, owing to the type of the disease or treatment. The period of contagion may be prolonged when disinfection is not faithfully carried out; but children should not be admitted to school at a shorter time than above mentioned.

**KEATINGS POWDER.**—Kills bugs, fleas, moths, beetles, and all insects (perfectly univalued). Harmless to everything but insects. Sold in Tins, 6d. and 1s.  
**WORMS IN CHILDREN.**—Are easily, surely, and with perfect safety got rid of by using **KEATING'S WORM TABLETS.** Tin 1s. 1½d. Free by post 13 stamps.

CIGARETTE SMOKING.

**S**IR MORELL MACKENZIE strongly objected to a cigarette, as being the worst form of indulgence, from the fact that the very mildness of its action tempts people to smoke nearly all day long, and by inhaling the fumes into their lungs, saturating their blood with the poison. It should be borne in mind that there are two bad qualities contained in the fumes of tobacco. One is poisonous nicotine, the other the high temperature of the burning tobacco. To many, tobacco acts as a poisonous sedative, and indulgence in the habit is always injurious. The condition of the throat, as well as that of the general health, varies greatly at times, and a very small amount of smoking may often be attended with serious harm. Every smoker knows that when the stomach is out of order the pipe or cigar loses its charm; but it is not so generally known that at such times the tongue (which to the experienced eye is a mirror of the invisible stomach) and the throat are very vulnerable to tobacco. If Nature's warnings on these points are disregarded, as they generally are, the smoker will bring on himself much unnecessary discomfort, and even suffering. In connection with the variation in susceptibility just referred to, it may be mentioned that persons leading an indoor life are, as a rule, more injured by smoking than others. It is further worthy of remark that the inhabitants of temperate climates suffer more than the more idle persons, probably because of a more highly-developed nervous system, and also to the greater resisting power of throats less harassed by fogs and east winds, and partly, perhaps, to the use of milder tobacco.

"To conclude with a little practical advice," wrote Sir Morell, "let the singer who wishes to keep in the 'perfect way' refrain from smoking, and let him take it as an axiom, that the man in whom tobacco increases the flow of saliva to any marked degree is not intended by Nature to smoke."

As this includes everybody, it would follow that no one is benefitted, but injured, by indulgence of this kind.

THE GRUMBLER.

**W**HAT is a grumbler? The dictionary tells us that he is a discontented, ill-natured, surly fellow. The man who cultivates an unhappy spirit is bad; the chronic complainer is worse; the ill-natured grumbler is the worst. What a host of grumblers there would be if they all could be brought together! Could they be provided a country in which to colonise, they would have it all to themselves. Nobody would care to live in such company. A grumbler is always selfish, and usually lazy. He is never ready to give, is always ready to receive, but is without appreciation or gratitude. He is unhappy himself, and his misery is increased by any inability to make others as wretched as himself. It requires but a small investment of good sense as capital to go into the business of grumbling. Indeed, a grumbler is a witness against himself as to his poverty of mental calibre. Spurgeon said: "The gift of grumbling is largely dispensed among those who have no other talents, or who keep what they have wrapped up in a napkin." The grumbler does the least work, and mutters the most.

There is a fable that once upon a time a waggon was being dragged along a heavy road by a team of oxen. The axle-tree groaned and creaked terribly, until even the oxen became impatient, and turned round and said to the wheels: "Halloo, there! why do you make so much noise? We bear all the labour, and we, not you, should cry out."

Grumbling is a disease. A sure sign of its development is a disposition to see the ill, and a blindness to the blessings of life. The best prescription for the cure of this mental and spiritual disorder is a blockade against all thoughts of real and imaginary evils, and a wide-open port to a remembrance of mercies past and present. The old Jewish rabbis had a saying, "The camel desired horns, and his ears were taken from him." There would

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

be far less grumbling in the world if the grumblers felt that the good things they have might all be taken away from them.

## THE SENSATION OF PLEASURE.

IT will be remembered that the philosopher-physician of Weinsberg anatomises the inner man as a triplicate, *Seele, Nervengeist*, and *Geist*, thus adding a member to the older twofold division of *Nous* or *Phren* and *Psyche*. Contrariwise, it has been the aim of modern psychology to obliterate the classic division of the soul as twofold, and explain even the very subtleties of man's powers and finest of his emotions as, in ultimate analysis, pure affections of the *Psyche* or animal half, as used to be thought, of that entity. Thus we have seen the analytic method applied to the reduction of the will itself to a system of sensations, and now we have Dr. Bourdon, in the *Revue Philosophique*, for September, 1893, exhibiting *Psyche* as the parthenogenetic mother of Pleasure without any co-operation whatever on the part of the celestial Eros—her divine spouse according to the delightful old Greek fable. This denial of a loftier birth—claim and “bringing down of pleasure from a height between heaven and earth,” as Dr. Bourdon phrases it, and “tying her up to a merely sensorial origin” will be, as he contends, a new gain, should the case be thought proven, for physiological psychology, whatever loss may ensue to the poet and the moralist; but thorough inquiry into the nature of this phenomenon appertains to the province of psychology, which need not too greatly concern itself with the moralist's teaching—a dictum to which no one certainly will deny the merit of candour. At the same time it should be said that this remark is made in another connection. While no one, says Dr. Bourdon, has ever claimed for this phenomenon (of pleasure) the character of an innate conception, the propriety, on the other hand, of ranking it among our sensations has seldom been mooted. Yet that the pleasurable sense rests on a physical basis is implied in the very expression. But what that organic substratum may precisely be is a question hitherto not solved unless it is now solved satisfactorily in the essay before us. And the solution he gives—not finding any either in Wundt's theory or in the observations of Bravis, Mantegazza, and others cited—is that it is a special sense having its organs in the skin, and is of the same nature as the sensation of tickling (*chatouillement*). No doubt a pleasurable feeling is the normal concomitant of every function of the organism in a good state of health—a state less common, by the way, than many suppose. But this pleasurable feeling or sense of the agreeable Dr. Bourdon is careful to distinguish from that special pleasure sense, which he has in view, and seeks to locate anatomically, just as what is disagreeable seems distinct from what is painful. For this distinction he instances bitterness, and remarks that the gustative sensation evoked by this quality is disagreeable, but not painful like that caused by mustard essence or acetic acid. He suggests, or rather affirms, that the general tendency to identify the disagreeable with the painful and the agreeable with the pleasurable is due to the fact that in one case there arises desire for bodily approximation, for taking close to oneself, and in the other of avoidance and repulsion of contact. He shows from anatomical and physiological considerations the various pleasures arising from the action of the special senses, and so, too, that created by mental emotion, are each and all accompanied by a gentle diffuse cutaneous excitation analogous to that produced by tickling (*chatouillement*). Taking the auditory sense, for example, he remarks that all the sounds we utter are accompanied by mechanical excitation, not merely in the buccal region, but often also in a considerable portion of the entire body. And, in fact, do we not know that no fewer than forty-six muscles are concerned in every pulmonary effort? Our bodies vibrate to all sounds, and it is, in part, through the perception of these vibrations that deaf mutes learn in our day to speak. Simple experiments are suggested to show this, so that “one may boldly affirm,” says Dr. Bourdon, that the hypothesis which would make the sense of pleasure

in audition really due to gentle cutaneous excitation explains extremely well the depth and extent of the emotions which sounds are apt to cause us to experience. As an instance of the mode in which a mere emotion unconnected with sense may arouse the pleasurable feeling we may take that of joy. Joy and pleasure, he remarks, are often taken as synonymous. Now one of the characteristic phenomena of joy, set well in relief by Lange, is the dilatation of the capillary vessels, and consequently the afflux of the blood to the whole periphery of the body. But this afflux sets up a gentle excitation of the skin like that produced by tickling. Joy, too, as Lange shows, induces also muscular excitation, but even in default of this the result would not fail. Dr. Bourdon affirms that there would be no difficulty in showing that what are metaphorically termed elevated pleasures are no less susceptible of the application of his hypothesis, which, in short, proposes to substitute for the theory that the pleasurable sense is a common element in all sensation, or may be so, the idea that it is a special sensation having special structures as an organ, and that this sensation is a diffuse tickling of the cutaneous envelope (*chatouillement*) of very moderate intensity. Thus the last phenomenon and only one which the new psychology has not made its own would, like the rest, be henceforth included with them in the domain of the senses. That Dr. Bourdon has succeeded in his demonstration we would hesitate to affirm, but he has written an interesting article.—*The British Medical Journal*.

## A WOMAN OF THE WORLD.

SHE IS A GREAT BLESSING TO EVERY-ONE SHE MEETS.

SHE had been talking pleasantly to two or three women; she had made her good-byes all cheerful and bright, and, after she had disappeared, one woman turned to another and said in a tone that was scoffing: “She is a thorough woman of the world.” Now in this case the woman who had said none but pleasant words, who had stopped by a bright story the discussion of a petty scandal, was a woman who was as brave-hearted as any that ever lived, and who bore, not only her own, but the burdens of a good many other people, yet she saw no reason why she should inflict her troubles on her friends, nor why, while she was in the world, she should not be in its best sense a woman of the world.

A woman of the world is one who feels that the story told to hurt your feelings is essentially bad form.

A woman of the world is the one who is courteous to old people, who laughs with the young, and who makes herself agree to all women in all conditions of life.

A woman of the world is one who makes her good-morning a pleasant greeting, her visit a bright spot in the day, and her good-bye a hope that she may come again.

A woman of the world is one who does not gauge people by their clothes, or their riches, but who condemns bad manners.

A woman of the world is one who does not let her right hand know what her left hand does. She does not discuss her charities at an afternoon tea, nor the faults of her family at a prayer-meeting.

A veritable woman of the world is the best type of a Christian, for her very consideration makes other women long to imitate her. Remember that Christ came into the world to save sinners, and be in the world and among it, and the people who made it, and to do your work as a woman of the world means more than speaking from platform or assumed elevation.

A woman of the world is one who is courteous under all circumstances and in every condition in which she may be placed. She is the woman who can receive the unwelcome guest with a smile so bright, and a handshake so cordial, that in trying to make the welcome seem real it becomes so. A woman of the world is one whose love for humanity is second only in her life's devotion, and whose watchword is unselfishness in thought and action. By making self last, it finally becomes natural to have it so.

## THE VALUE OF THE SUNFLOWER.

APART from moral considerations, it would be wise for those engaged in the opium traffic to look out for a more permanent line of business, and for landowners to encourage the growth of other crops, such as wheat, linseed (*alsi*), &c. In this connection attention might be given to the sunflower. Millions of these are annually grown in Russia for commercial purposes. As a garden plant it is well-known, and its seeds have been profitably used to feed fowls. It is also an absorbent of malaria, and is thus, like the eucalyptus, a desirable windward neighbour in feverish localities. But its cultivation for mercantile purposes began only in 1842, and in 1887 it had so increased that 700,000 acres were under that crop, and the farmer who started it is said to be now a millionaire. Two kinds are grown—one with larger seeds, which are eaten by the common people in enormous quantities as dainties, just as groundnuts (*mung phali*) are eaten, the other, with smaller seeds, for the production of oil, which, owing to its nutritious qualities, purity, and agreeable flavour, has superseded all other vegetable oils. The substance remaining after the oil has been extracted is valuable as food for cattle, and is so largely exported to England and Germany as to form one of the principal exports of Russia. The shells are used for fuel, and the seed-cups as food for sheep.

## D ANDRUFF.

DANDRUFF is simply a dry catarrh of the scalp. It is a condition in which the cells of the skin are thrown off too profusely. The skin is composed of three layers—the true skin, that next to the muscles; the pigment layer; and the dead cells, or scarf skin, on the outside. With a sharp knife you can scrape off the outer layer, in the form of little white scales. It may not be generally known that man is an animal with scales like a fish, but if you will examine this white scurf with the microscope, you will find that it is composed of scales similar to those of a fish. And these extend all over the body.

When one takes a Turkish bath these scales are softened up and rubbed off in the shampoo, so that, to a certain extent, the person is skinned. These scales are rubbed off by the clothing, and come in contact with other bodies. This process is going on all the time, and those parts of the body which are most exposed, and have the most attrition with external bodies, are kept the most thoroughly cleansed and free from this condition of dandruff. You will never find scales in the palm of the hand, because frequent contact with various objects keeps the dead scales rubbed off and the palm free.

But on the head, where the hair prevents this exposure of the skin directly to contact with outside bodies, these scales are retained in great numbers. Especially is this so when the head is covered much of the time by a hat or bonnet. The scales are thrown off, but they are held about the roots of the hair, and in this way one may have an accumulation of dandruff even when the skin is healthy. In this case, the remedy consists in brushing the scalp thoroughly and frequently. Most people make the mistake of brushing the hair; it is not the hair that needs to be brushed, but the scalp. This is very important for the health of the scalp. You will notice that the good barber puts aside the hair with his finger, and follows his finger with the brush, until he has brushed the entire scalp in this way. By this means the scalp is thoroughly cleaned. The scalp should be brushed in this way at least three or four times a week, in order to keep it free from dandruff, or from those scales which are constantly being thrown off.

A neglect to remove these scales from the body produces a very unhealthy and disagreeable state of things in other parts of the body than the scalp. It sometimes causes itching of the arms and legs, particularly about the knees and shins, where the scales have a tendency to accumulate, if one does not bathe frequently.

Every hair on the body grows from a little pocket in the skin; and when these little scales are not promptly removed, they get over these pockets, and then the hair, in attempting to grow, is forced to lift the scale up. This is what causes the itching that is so disagreeable. Equal parts of alcohol and castor oil, applied after a thorough shampoo with good soap and water, is the best remedy for dandruff.

## PURE WATER.

**C**HOLERA is often justly described as a scourge. And a scourge is an instrument of correction or chastisement. To chastise is to make chaste, to make pure, to inflict pain for the purpose of recalling to duty. Of a certain ancient worthy it is recorded that "he took thorns of the wilderness and briars, and with them he taught the men of Succoth." Teaching requires occasionally such severe measures. *Jedes Pestjahr ein Lehrjahr* is an old German proverb with which doctors and laymen alike have been wont to comfort themselves after they have passed through a year of plague: it has been for them a year of learning. It would be sad indeed if such a calamity as that of Hamburg did not leave some valuable lessons behind. Of Coleridge's "wedding-guest" it is told that "A sadder and a wiser man he rose the morrow morn." It is some comfort that wisdom may be so closely associated with sadness. And now that there is no doubt about our having Asiatic cholera in the Humber ports, it is well to remember that one of the chief lessons of the Hamburg outbreak was the absolute need for keeping the water pure. The people of the great Hanseatic city have been taught it in a Draconian fashion, and we, their neighbours, may rightly lay it to heart.

It was fitting that at the recent Edinburgh Congress of the British Institute of Public Health practical use should be made of the bitter Hamburg experience; and those who were present will remember that in his paper on the Bacteriological Examination of Water, Professor P. F. Frankland, of Dundee, illustrated his theme very fully from the instructive observations that had been made on the method of the water-supply during the progress of the epidemic. He called renewed attention to the fact, which has been frequently emphasised, that, while the city of Hamburg proper was devastated in a most appalling fashion, the contiguous town of Altona, which is practically a part of Hamburg, and which was likewise supplied with water from the River Elbe, had only a comparatively slight visitation of the dreaded disease. What was the cause of this exemption? There is but one opinion among German experts, to the effect, namely, as was stated by Professor Frankland, that the larger city suffered because the water used by its inhabitants was supplied to them in an unfiltered condition, while that which was used in Altona was submitted to a very careful sand-filtration before it was distributed for use. The natural conclusion is that it was the unfiltered water that spread the disease.

The moral of this plainly is, that you should have your water filtered, especially in times of epidemic, unless, indeed, you are so fortunate as to enjoy a supply that stands in no need of filtration. It is not every city that rejoices in such a store as that which is provided in Loch Katrine. But it is not enough that the water should be passed through something called a filter. There is a good deal of superstition abroad regarding this matter. The use of filters may be pushed to a fanatical extreme; for it is quite possible to contaminate water that does not require any purification by passing it through filters that are constructed on wrong principles, or that are not periodically cleansed.

Even sand-filtration, which has been found so efficacious in Altona, does not withhold all the bacteria that may be contained in the water which it is sought to purify. Professor Robert Koch has been discussing the subject in one of the German hygienic journals; and with reference to the experience in Altona, he points out that it is not so much the sand used in the filtration, as the fine layer of slime deposited by the water on the surface of the sand, that really keeps back the bacteria, and that is, therefore, the effective constituent in the sand-

filter. This view was concurred in by Professor Frankland in his Paper read before the Edinburgh Congress; and he is of opinion that the water to be filtered should be introduced below the sand-bed, and allowed to rise through it. In how far, however, this method of passing the water through the filter might interfere with the depositing of the protective coating of slime he did not indicate. In order that the filtration shall be as effective as possible, two conditions are necessary—first, provision should be made for the maximum storage of the water to be purified; and, secondly, the process of filtration should be as slow as possible. With a view to secure the object last mentioned, the depth of the bed of fine sand, according to the Professor, should in no case be below two feet. This allows sufficient time for the water to percolate through the sifting material, and therefore for the oxygen contained in the interstices to mix with the water in passing, and to rid it of organic constituents. There are occasions, however, such as the time of the recent drought, when the number of bacteria in the available water supply increases enormously, and when, as Dr. Hunter Stewart pointed out at the Congress, even sand filtration is unable to cope with such a condition of affairs suddenly arising.

The bacteriological examination of water is not, however, of itself enough to determine whether or not it is sufficiently pure and safe for human use. Organic impurities are, no doubt, the most generally dangerous, for it is to them that the origin of enteric diseases can usually be traced. But water may be made unfit for use by the presence of inorganic constituents that are hardly less fatal to the human constitution. It is necessary, therefore, that chemical analysis should be conducted concurrently with biological examination. But here it is found that considerable difference of opinion at once arises among those who ought to be well versed in the different aspects of the question. No standard of purity has yet been laid down from which different scientists do not considerably diverge. This divergence of opinion was brought out at Edinburgh, although not in any very striking way. Sir Charles Cameron, for instance, found himself in disagreement with many hygienists as to the amount of chlorine that is permissible in water so that it shall still be safely potable, while Dr. Nasmith, Medical Officer of Health for Fifeshire, admitted that there was a good deal of scepticism in the public mind regarding the value of the opinion of chemists as to the safety of water, and rather justified that scepticism by suggesting certain alterations in the usual practice of analysts with a view to securing greater confidence in the results at which they arrive.

It is plain, indeed, that no general consensus of opinion has yet been reached on the question of what constitutes pure and safe drinking water, and it would, in our opinion, be an immense hygienic benefit to the public if the experts, after a wide and, so far as possible, exhaustive investigation, could agree upon some finding that would be satisfactory to the lay mind. No standard could, of course, obtain universal, or perhaps even general, recognition, at all events, as regards details; for the geological character of each district would, so far, determine the quality of the water it yields. But it would be a distinct advantage to have a standard even for a district, so that any divergence from the normal character might indicate where the contaminating element should be looked for. And meanwhile, in the presence of the danger with which we are threatened, it is well to profit by the lesson which the Hamburg-Altona experience has taught us. There is nothing so important as the water we drink and use in cooking. At all costs this must be kept pure. And if it has to be drawn from a contaminated or even suspected source, it is of the utmost consequence that it should be submitted to effective filtration previously to being used. As we have seen, sand is usually an adequate medium for this purpose; but it may be also desirable to add to the filter some substance that is destructive alike to germ and spore, and that is at the same time innocuous to the human organism.—*Sanitary Record*.

BIRDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

## THE HYPOCHONDRIAC.

By L. R. PEABODY.

**N**O interest does she take  
In mountain, plain, or lake;  
But on microbes can she fluently converse.  
The workings of her spleen,  
Her temperature mean,  
And the history of her case will she rehearse

Such pains are in her head  
She wishes she were dead.  
(Oh, tell it not in Gath, so do I!)  
She is surfeited with nerves;  
Her stomach only serves  
To rouse hostile demonstrations from the pie.

Her liver's on a strike;  
Neuralgia and the like  
Hover threateningly over her like a pall.  
Her pulse is so erratic,  
Her breathing so asthmatic,  
That daily on the doctor must she call.

Her tastes are very notional;  
Her temperament, emotional;  
True sympathy she ne'er expects to find.  
She has doctors by the score,  
But always longs for more  
When they tell her that the trouble's with  
her mind.

She says one must be daft  
To allow the deadly draft  
To meander through the sleeping-room at night.  
She lives on assafoetida,  
Valerian, bromidia,  
And hibernates in rooms that are air-tight.

The blood rushes to her head,  
"Quite naturally," we said,  
"Since a vacuum by Nature is abhorred."  
She finds children "so distracting,"  
Grown people too exacting.  
From such as she deliver us, good Lord!

## ANATOMY OF THE OYSTER.

**E**VERY oyster has a mouth, a heart, a liver, a stomach, beside many curiously devised little intestines and other organs—necessary organs, such as would be handy to a living, moving, intelligent creature. The mouth is at the end of the shell near the hinge, and adjoining the toothed portion of the oyster's pearly covering. This tiny, little apology of a mouth is oval in shape, and, although hardly visible to one unused to making such anatomical examinations, can be easily discovered by gently pushing a bodkin or a piece of blunt, smooth wire along the surface of the locality mentioned. When the mouth is at last located you can thrust your instrument through between the delicate lips and a considerable distance toward the stomach without causing the oyster the least pain whatever. From this mouth there is, of course, a miniature canal leading to the stomach. Food passes through this canal to the stomach and from the latter organ into the intestines, just as really as though the little bivalve were as large as an elephant or rhinoceros. Remove the shell (this operation is rather rough on the oyster, but can be done in a comparatively painless manner by an expert), and you will see the crescent, which lies just over the so-called heart. This half-moon space is the oyster's pericardium. Within is the true heart, the pulsations of which can be readily seen without the aid of a glass. The heart is very human-like, made of two parts, one of which receives the blood from the gills through a network of real blood-vessels, the other portion contracts and drives the blood out through the body. The other organs of an oyster's anatomy are all in their proper places, and performing their several functions.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 14d. and 2s. 6d. (the latter contains three times the quantity of all Chemists. Sent anywhere on receipt of 15c or 14s stamps by the Maker, E. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**BOILED CHICKEN AND RICE.**—Stuff, tie in mosquito netting, put in hot water and boil—not violently—twelve minutes to the pound. One half hour before serving take out one cupful of liquor, skim, strain, and season. Soak one cupful of rice two hours, boil ten minutes, drain, add to this the broth and set in double boiler. Simmer till rice is soft, but do not stir it. When soft, stir in with fork one teaspoonful each of butter and minced parsley, and one beaten egg. Cook one minute, take from fire, make into flattened mound, and lay fowl on it. Serve with white sauce or pot liquor.

**STEWED DUCK.**—Stuff, adding dash of lemon juice. Pin in cloth, cover with water, and stew two and one-half hours. Serve with curry or acid sauce.

**CHICKEN POTPIE.**—Cut one-fourth pound of pork in strips and put in kettle, then layer of jointed fowl, sprinkled with minced onion and just covered with water. Cover with thick (short) biscuit dough and stew one half hour. Brown crust with red-hot shovel held over it, drawing kettle to stove's edge. Take off crust and keep hot while brown sauce is made of gravy. Cut crust in squares, return to gravy, cook ten minutes, and serve.

**CHICKEN AND TOMATOES.**—Cut up, dredge, and fry fowl. Add a little flour to butter, after taking out chicken. Add hot water, one pound of cut-up tomatoes, chopped parsley, red and black pepper and salt, and stew smooth. Add chicken and three tablespoonfuls of butter, and cook in double boiler two hours. Add a little well-washed rice, and cook till that is tender.

**OYSTER PIE.**—Half fill dish with oysters, seasoned, and their liquor added; thickened with braided flour. Cover with biscuit dough, and bake.

**COD WITH CREAM SAUCE.**—Boil fish, drain, and slice. Braid one tablespoonful of flour, add pepper and nutmeg; when smooth, add one pint of rich milk—or cream—and chopped parsley, and pour over fish.

**LOBSTER BISQUE.**—Cut two pounds of lobster small. Boil shell with one pint of water, and strain. Boil one quart of milk, add to two tablespoonfuls of braided flour, adding one teaspoonful of salt, one saltspoonful of white pepper, one-fourth saltspoonful of cayenne, the liquor in which shell was boiled, and serve.

**EELS EN MATELOTTE.**—Boil two pounds of eels with one tablespoonful of salt in cold water. Add onion stuck with ten cloves, two tablespoonfuls of vinegar, boiling fifteen minutes. Dry eels in cloth, roll in flour, and fry in two tablespoonfuls of butter, adding a bouquet of herbs and one pint of boiling water. Season with one teaspoonful of salt and one-fourth saltspoonful of pepper. Peel a pint of button onions, put in a pan with one teaspoonful each of butter and sugar, and toss over fire till brown. Add to the rest and simmer one hour. Add one glassful of wine, and serve with strips of fried bread.

**SALT MACKEREL.**—Soak over night. Wrap in cloth and simmer twenty minutes in water to cover. Melt a little butter, add cream and chopped parsley for dressing; or add lemon juice, vinegar, gooseberry sauce, or currant ketchup.

**SALMON SCALLOPS.**—Chop one can of salmon, add one-half cupful of white sauce, one-half cupful of crumbs, salt, pepper, and minced parsley. Fill pattypans, strew with crumbs, and bake.

**STEAMED BASS.**—Wrap fish in cloth, cover bottom of steamer with sliced potato, add two small chopped onions, and fish to top of all. Steamed till done. Remove bones from fish, put in pan layer of buttered crackers, then potato and onion, then seasoned fish. Pour rich milk over, and simmer till done.

**TIGHT LACERS.**—Ladies and Gentlemen's Corsets Fitted Personal visit not necessary. Self-measurement form free by post. Satisfaction guaranteed. Best qualities. Lowest prices. Close fits for Professionals. Neatness, comfort, health. **FORD AND PARK**, 141, Stockwell Road, London, S.W. Estab. 1866

**SWEETBREADS AND MUSHROOMS.**—Brown one can of mushrooms in two tablespoonfuls of hot butter. Take out, add two more tablespoonfuls of butter, and fry four large parboiled sweetbreads. Add mushrooms, and simmer in covered double boiler.

**MATELOTTE OF FISH.**—Stuff fish with dressing of one-half pint of oysters, bread crumbs, salt, pepper, butter, one egg, and chopped parsley. Put sliced pork under and over fish. Pour one pint of water over; have bouquet of herbs in corner of pan. Bake one-half hour, basting often. Serve with fish sauce.

## HINTS FOR THE HOUSEHOLD.

**TO WASH CHAMOIS GLOVES.**—Take a basin of warm water, into which pour a teaspoonful of ammonia; then make a strong lather or suds of some white soap, but on no account rub the soap on the gloves. Wash the gloves thoroughly in this water, rubbing with the hands until clean as they can be made, rinse them well in warm water, softened by a little ammonia, press dry in a towel, and hang by the tips of the fingers to dry. When dry they will be stiff and hard, but this can be rubbed out between the hands. If they are hung to dry with the finger-tips down, the water will drip to the ends, and it will be difficult, if not impossible, to get them soft.

If the water boils out of an iron tea kettle, do not pour in cold water whilst it is hot, lest the kettle crack; either take it off the fire to cool or pour hot water in.

**STRONG carbolic acid** is sure death to bugs. It is also one of the very best disinfectants. A bottle should be kept on hand—out of the reach of children—and a few drops occasionally put down the sink drain.

The fumes of a brimstone match will remove berry stains from the fingers.

**LIGHT scorch-marks** may be removed by simply moistening them with water and laying in the sun.

**ALL embroideries and coloured garments** should be ironed on the wrong side wherever practicable.

The skins of new potatoes can be removed more quickly with a stiff vegetable brush than by scraping.

The toughest fowl can be made eatable if put in cold water, plenty of it, and cooked very slowly from five to six hours.

**AFTER** taking cake from the oven, let it remain in the pan about five minutes; it will then come out easily without breaking.

**A HALF-PENNYWORTH** of whiting and a bottle of ammonia will keep silver forks, spoons, and other tableware always bright and shining.

**INSTEAD** of toasting bread for pea soup, porridge, &c., try drying it, or roasting it till crisp, in the oven, and see how superior it will be.

**GREASE** may be taken out of carpets by covering the spot with powdered French chalk, laying a soft brown paper over the chalk, and covering with a warm iron.

It is as essential to health that the air of the kitchen should be as pure as that of the parlour, because food prepared in foul air partakes of the foulness to a great extent.

**A PUZZLE, INDEED.**—Mathematical puzzles are generally very far from interesting, but there is one which would puzzle most people to explain. It is this: Open a book at random and select a word within the first ten lines, and less than the tenth word from the end of the line. Now double the number of the page, and multiply the number by five; then add twenty; then add the number of the line selected; then add five; then multiply the sum by ten, and add the number of the word in the line. When this has been done, subtract two hundred and fifty, and the remainder in the unit column will indicate the number of the word in the tenth column, the number of the line, and remaining figures the number of the page. The result is infallible, but that is not strange. The curious thing about it is: How is the result obtained?

If one wishes to cool a hot dish in a hurry, it will be found that if the dish be placed in a vessel full of cold salty water, it will cool far more rapidly than if it stood in water free from salt.

Do not attempt to extinguish the flames of blazing paraffin with water, it will only make them worse. Pour corn meal or flour quickly over them, or throw over a rug, or anything handy that will exclude the air.

**RUSSIAN DISHES.**—Mushrooms are largely used in Russia as a substitute for meat; and a familiar sight in the cottages of poor is the strings of the small, shrivelled delicacies, looking like so many bits of brownish leather suspended with strings of onions from the rafters. There are, in that country, at least a dozen edible varieties, some of them very choice. They are pickled, dried, and preserved in many ways. The oil of green hemp seeds, eaten with a radish nearly as biting as our horse-radish, is a popular relish in the same country. Rape-seed and sun-flower seed oil are often used as a substitute for olive oil or butter, in both cooking and pastry-making. Almonds, made into a paste and mixed with water, are used in making desserts as a substitute for milk, and the same mixture is used to flavour tea and coffee. A traveller who knows this beverage well says that it is delicious in the extreme.

**PICTURE FRAMING.**—So soon as a picture leaves the easel and is placed on the wall, some device becomes necessary to separate it from the surroundings or neighbouring pictures. Perhaps none is so effective as that of fitting it into a panel or other defined wall space; but this, of course, is only possible when the wall is fashioned for the picture, or the picture especially painted for its position on the wall, neither of which conditions it is usually convenient to provide in domestic architecture. So the canvas is generally fitted into a wooden frame, to be suspended from the cornice. But the natural tints of wood are not vivid enough to isolate the enclosed space from confusion with drapery and wall surface; nor will it do to paint it a strong tint which would clash with or react on the artist's colouring. It was very early discovered that a gold surface, though its hue is yellow, owing to its peculiar lustre, does not possess in a perceptible degree the blue or violet reaction of yellow. The most delicate tints may be laid close beside it; the only effect is to enhance their proper quality. Moreover, gold clashes with no colour; it is distinct from any pigment employed in painting, and ought to be distinct from anything employed in the decoration of a wall on which paintings are hung. Alas! that it should be necessary to comment on the execrable practice of introducing streaks and splashes of gilding into the designs of wall papers!

## A SURFEIT.

**A SURFEIT** in man is called founder in a horse, and is over-eating—eating more than the stomach can possibly convert into healthful blood. Wise men and careful men will sometimes inadvertently eat too much, known by a feeling of fullness, of unrest, of a discomfort which pervades the whole man. Under such circumstances we want to do something for relief. Some eat a pickle, others swallow a little vinegar, a large number drink brandy. We have swallowed too much, the system is oppressed, and Nature rebels. Instinct comes to the rescue and takes away all appetite, to prevent our adding to the burden by a morsel or a drop.

The very safest, surest, and least hurtful remedy is to walk briskly in the open air, rain or shine, sun or hail, until there is a very slight moisture on the skin, then regulate the gait so as to keep the perspiration at that point until entire relief is afforded, indicated by a general abatement of the discomfort. But as a violence has been offered to the stomach, and it has been wearied with the extra burden imposed upon it, the next regular meal should be omitted altogether. Such a course will prevent many a sick hour, many a cramp, colic, many a fatal diarrhoea.

## THE MOTHER'S PAGE.

### FURNISHING THE NURSERY.

IN every house in which children reside a room should be set aside exclusively for their use, and is as necessary as the best room for their elders, and quite as important. If a house is so situated that a floor can be set apart for this purpose, and known as the children's room, it should have, without reservation, all the advantages, all the best appointments that the home possesses, and no pains should be spared to make it attractive and healthful.

In the first place, the room or rooms provided for the nursery should be the brightest and cheeriest which can well be appropriated. They should have such an exposure that the rays of the sun may flood the floor, while there should be ample provision for pure, fresh air, without which the little lungs cannot do their appointed work and the little bodies cannot thrive. Above all, the nursery should not be situated on the top floor, out of consideration for the wee folks, whose little legs are not strong, and who complain of fatigue when that top is reached. Consideration should also be given to the nurse, on whom so many duties devolve, whose wearying footsteps are never at rest, and whose nights are full of care and responsibility. In many cases these faithful helpers are up and doing far into the small hours, and have no rest until the early morning light.

In this bright room the woodwork and mouldings should be of hard wood; walnut and cherry are altogether the most desirable, and when soiled admit of cleansing by wiping off, without injury to external appearance. For a nursery wall, paint is much preferable to paper, which is apt to collect insects, and if at any time a contagious disease occurs in the apartment, a repapering must be done after the sickness is over. A good coat of French-grey paint, of which there are many shades, gives a pleasing effect, and has none of the disadvantages of paper. If one of these small mischief-makers by a strange perversity marks the wall with a lead pencil, it can be thoroughly washed off with a sponge and suds of soap powder, when its pretty surface will be clear and bright again.

The ceiling should be kalsomined, which gives it a pure and cleansing property, and it can be done in whatever colour taste dictates, the centre a delicate tint, and the curves and cornice a deeper shade of the same colour. The walls and ceiling can complement each other, and produces an admirable scheme without expense.

As to floor coverings, a good substantial rug, either of English manufacture or some Oriental texture, will answer if the tones are of a good brown or red—for it must not be forgotten that cheerful carpets are greatly valued by children, who admire nothing so much as bright colours. A border of varnished parquet flooring is a capital scheme for cleanliness, as the dirt and dust can be wiped up each day and the rug kept in good preservation by a weekly sweeping of salt or wet corn meal. Every method should be adopted to protect our little ones from disease germs so detrimental to their bodily comfort.

If a room is of fair size, and the children number only two or three, and are of tender years, small brass bedsteads can be conveniently stored away in each corner, and yet there will be plenty of space in the middle of the room for their comfort and play. It is a rule which should be firmly established, that no child should share its bed with any other child, however crowded. Sleeping children should have plenty of room to enable them to rest their little limbs in whatever position they select. In visiting a country house some years ago, there was quite a family of little girls who had for their nursery the best room in the house—an old mansion whose age ran into the hundreds. On entering the room the objects that first arrested attention were the little beds, placed at quite a distance, in a row, with their

snow-white coverlets and small pillows, ready for occupancy when the time came. By the side of these tiny resting places a little chair was nicely cushioned, and no cleaner or lovelier room could eye ever rest on. At an artistic house of one of our well-known painters, the little daughter of the family had a small bedroom, which for quaintness was indeed a striking example of taste. The room was furnished in white and gold. The bed was of pine painted in white enamel paint; on the head-board was a decoration of flowers most artistically wrought of delicate pink, and in the middle a wreath of delicate morning-glories, on which the name of "Marie," in white and gold, formed the centre. It was a charming idea, and at the time attracted universal attention.

For these beds a ring can be fastened on the ceiling, and in the winter heavy curtains can be run through, and serve as a protection from the night air. Two sets of blankets are necessary. For winter the heavy ones, whose broad borders are in crimson and dark blue; and in summer thin blankets are sometimes needed. But on each bed during the winter season an eider-down quilt should be folded, and serve as a warm protection for the feet. Chairs with low seats should be plentifully given: little rocking-chairs, stools, low benches well cushioned, and ottomans of good size are acceptable for a nursery.

In regard to the water arrangements, dispose at once of any stationary basin, any flowing water. If for the ablutions water has to be carried up or down a flight of stairs twenty times a day, better so than these death-traps, where all kinds of diseases find their vent. A large, deep basin, plenty of good-sized covers, water pails with liberal spouts, will serve to make any toilet for any number of children, even if generously used. For the nursery a portable bath tub of tin, painted, with seat and cup for soap, should be available for any room where children are daily bathed. A foot tub can also be advantageously used at odd times, and both will find a place in some commodious closet. Two bureaus of inexpensive make are quite necessary where the little one's clothes are kept, and although a cover is required for neatness, yet any delicate decoration is wholly unnecessary in this room, where every article should be for use and not for show.

In every nursery a hanging closet or small set of shelves with closed doors should be provided. Salves of all kinds should find there a place, and the old-fashioned home medicines, that can be given according to the mother's judgment, should be labelled and ready for use. This closet is a handy place, and by having doors will be kept quite fresh and pure.

The two closets which are divided for the general clothing of the children should be kept in order by the nurse. A strong table and of good form should find a place in this room, and a decorative cover in some subdued colours should be given. All games, boxes of toys, and the other articles so precious to the little ones, should rest in safety there.

There is one other piece of furniture most essential in the nursery—a hanging bookshelf. It is only while a child is a baby in arms that a book is without its charm. After they pass the age of two and a half, there are times in which, when every other amusement fails, the book takes a place which nothing else can fill. As night approaches the little feet are tired, the day is over, the mother free from the home duties gives herself up to her little ones, and then is the children's hour, when a fairy story, a dancing rhyme, the little poem in which bears, pigs, and dogs figure, soothes many a weary child. The mother's arms, the tender voice, the jingle of the rhymes, and the human nature in the story that strikes the chord in the child's heart, these together will bring rest and quiet to the weary little darling with the closing of the day.

As to draperies, decorations, and fine furnishing, eschew everything of the kind. A good shade for windows, nine months in the year, is the suitable covering. But during the winter, let the heavy curtains be adjusted, for at night they protect the little ones from the cold, and

keep from the cracks and crevices the airy ripples that chill the room when the weather is stormy and dreary. If in a country house the nursery is a room of wide dimensions, an old rowboat can be placed in one corner, and will afford an endless source of amusement for the little men and women, who will never tire of it. It will prove, as well, a source of rest for the nurse and mother, however much they delight in these little folks and their charming ways.

There are a few rules with which all mothers of families should comply in all earnestness. Never promise a child anything at any time, which it is not in your power to grant. A promise to a young person should be fulfilled at any cost. Children should be taught all the code of rules that pertain to the table, and to respect their elders under all circumstances. All mothers should study the hygiene of childhood, and for the little ones care should be taken not to overfeed them. Give a sufficient supply of nutriment at the hours when the digestive organs are at their best. From babyhood until the fifth year mothers are apt to forget the importance of warmth for the protection of the body. Long stockings should be worn, as should high neck and long sleeves throughout the year. Flannel should well protect the chest and loins, and be of appropriate weight for the season. When children have attained the age in which thick shoes serve as a protection to the feet, the buying of shoes should be the first consideration, and dampness, however slight, should be avoided.

During the hours of sleep, fresh air is one of the most essential attributes, and one should remember that one-half of a child's life is spent in bed. A current of air should pervade the room, yet care should be taken that an adequate amount of bed-clothing is provided. Blankets are the only suitable bed covering for any child. A window can be lowered a few inches from the top, and that is enough ventilation except in a mild night. An open fire in severe weather is a first-class ventilator when the warmth of the room should be husbanded. Every child, either large or small, should have sufficient exercise during the day to maintain a good state of health. If the weather is fine, they should be out of doors most of the time, and the surroundings of every child's life should be entertaining and interesting. If the weather is severe, a large nursery will serve as a good play place, so that exercise can be secured at all times.

Cast-iron rules apply in no case. Every mother should decide for her child a special treatment for its physical body, and study with care its traits of constitution, what suits its temperament, and how all questions can be disposed of in any individual case. For all babies, little children, boys and girls of a larger growth, the sleep which Nature demands should be given with generosity and consideration. Every child should have at least ten or twelve hours of good sleep every night, sleep which is restful and undisturbed. If a child is nervous and prone to be irritable, a warm bath will often allay these tendencies and give such repose that when the morning breaks the child will be full of happy smiles and cheerful words.

When we see a woman, the mother of a fine race of boys and girls, we can exclaim, in our admiration, "Happy woman! you have the crown of happiness, the charm of life, the fulfillment of many hopes." As the author of "Bachelor Bluff" declared, "Handsome boys and fair girls give felicity to any house;" "I hear merry voices, and see bright faces, and catch the gleam of tender eyes; and over all broods the spirit of harmony and peace."

DISOBEDIENCE IN THE ARMY is looked upon as one of the most grave crimes a soldier can be guilty of, and in the past it has often been punished with death. The fate of a battle and the lives of thousands of men, let alone our national honour, have often been dependent upon the prompt carrying out of what might have seemed a trivial order. Discipline without good health, however, would be like a house without a foundation; therefore, great pains are taken to keep our fighting men free from disease. Holloway's Pills have always been found an excellent medicine for this purpose, as, in addition to cleansing the blood, they invigorate and give tone to the system.

**STEEDMAN'S Soothing Powders** for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Walworth, Surrey. Sold everywhere. Please observe the **SS** in Steedman.

## TALES WORTH TELLING.

[COMPLETE STORY.]

## CHARLIE BEVERLEY'S RUSE.

By "B."

OLD Mr. Raymond was dead and buried. The wreaths and crosses of flowers that loving hands had gently laid on his grave were withered, and the world had got tired of talking of the merchant's business failure, followed so quickly by his death from heart disease.

And Kate Raymond was forgotten, too, as she sat by herself in the large house at Kensington, which was to be sold, with her black dress and her pale cheeks, and the unshed tears making her poor eyes heavy.

People had pitied her at first, but they took it for granted she would do "something"; at all events, it was none of their business.

"Well, my dear, have you made up your mind?" said Dr. Smith, as he came creaking into the room, and sat down beside her.

Kate looked up through the gathering tears.

"Doctor, I want your advice. Tell me what I had better do."

"Advice, eh? Well, it isn't easy to advise you. What do you think you are adapted to—hospital nurse or lady's companion? I happen know that Miss Beverley is in want of a companion, and I should advise you to go to old Miss Beverley, my dear, if you can be sure of patience and self-control with the old maid."

"I am not the wild, impetuous girl I once was; I can be patient now, doctor."

"Well, shall I tell Miss Beverley to expect you?"

"Yes; but, doctor—"

"Well?"

"How many members are there in Miss Beverley's family?"

"Only herself and a fussy old bachelor brother—ten times as old-maidish as she is herself. You may bless your stars you are not going as companion to the old man."

Kate smiled a little absently.

"There used to be a nephew—a medical student—who—"

"Yes, I know—Charlie Beverley, but he went to Scotland last year to assist a friend in his practice. At ten to-morrow then, my dear, I will call for you."

Dr. Smith creaked away in those noisy boots of his; and Kate Raymond went upstairs to pack her trunk and think.

So Charles Beverley was in Scotland! She had known that before, but somehow she wanted the doctor's testimony to make assurance doubly sure. She was glad; yes, upon the whole, she was very glad. She knew she had treated the honest, loving young fellow like a selfish, heartless coquette; she knew she had half-broken his fond, faithful heart with her airs, and graces, and false smiles once upon a time.

At ten o'clock precisely the next day Dr. Smith's carriage came to the door for Miss Raymond and her luggage.

"Keep up a good courage, my dear," said the kind-hearted old man. "Miss Beverley is rather trying, they say, but she has a heart, and you'll work your way down to it after awhile."

Kate hoped so, but she could not help feeling a little discouraged when Dr. Smith had left her alone in the darkened room, with a pair of green spectacles glaring at her from one corner and a pair of bluespectacles from the other.

Her first day as "companion" was ineffably wearisome. Patiently she trudged up and down stairs with Miss Beverley's gruel and the old bachelor's foot muffers.

The next day was harder still. Nothing went right. Miss Beverley seemed determined to be suited with nothing that was done for her, and the old bachelor from his corner growled a chorus to all her fault-findings.

Day after day passed by very much in the same style, and Kate Raymond grew paler and quieter with each revolving sun. At first her proud spirit had rebelled.

"I cannot endure it," she had thought.

But then came the bitter remembrance that she must endure it—that she had neither home nor friends to flee to!

And when at the week's end Miss Mary Jane

Beverley paid the astounding sum of five shillings into Miss Raymond's shrinking palm, she felt that it had indeed been hardly earned.

"There's one good thing about you, Miss Raymond," said the spinster, parenthetically, as she counted out the money; "one quality that none of my other companions could ever suit me in; you never get out of temper. You've never once lost your patience the whole time you've been here; and yet I used to hear a year or so ago, when my nephew Charlie was at home, what a changeable, fickle, impatient little thing Mr. Raymond's daughter was."

Kate coloured, and the tears started quickly to her deep brown eyes.

"No," said the old bachelor in the corner; "no, Miss Raymond never gets out of temper now!"

"How old are you now?" asked Miss Beverley, searchingly.

"I was twenty last month."

"Hump! only twenty? Well, I suppose you'll be getting married some day, and I shall lose my companion."

But Kate gently shook her head, without even looking up.

"I shall never marry," she said. "Nobody cares for me now."

"There, James, I told you you'd knock that vase off the window seat if you insisted on leaving it there," lamented Miss Beverley, as a sudden crash of breaking china interrupted Kate's voice. "Run, Miss Raymond, and don't let the water soak into the carpet. I don't see how men can be so careless."

And for once the old bachelor had no words of excuse to plead for himself.

"Miss Raymond," he said, in a low, hurried voice, when his sister's temporary absence had chanced to leave them alone together half an hour or so later, "you said a little while ago that nobody cared for you. That was a mistake."

Kate Raymond looked up in surprise.

"My nephew, Charlie Beverley, cares for you; he has never left off caring for you. If he thought you would never look kindly upon him again—"

But Kate shook her head.

"It is too late now to say these things, and yet—"

"But it isn't too late," interrupted the old bachelor, solemnly, rising out of his chair, taking off the blue spectacles, behind which sparkled a pair of brilliant black eyes, removing the rusty wig from a profusion of chestnut brown curls, and spurning the wadded flannel dressing-gown from him with a contemptuous motion.

Kate rose to her feet with a hysteric scream.

"Charlie!"

"Is it too late, Katie? Tell me! This last week has taught me how good, how gentle, and how patient you have grown, and I love you better than I ever did before. Can you forgive me for the ruse practised to learn whether I might indeed aspire once more to your hand?"

Kate Raymond said "no" at first, but she said "yes" afterward, when Charlie had convinced her of the perfect propriety of his conduct.

"And did your aunt know?"

"It was she who insisted upon it, Kate. She wished to prove the temper she had heard was so fickle and uncertain."

And the old lady's wedding present to Miss Raymond was a diamond brooch that a queen might have worn.

DEVOTION is not the play even of the highest faculties, but their deep earnest. It is, no doubt, the culminating point of reverence; but reverence is impossible without an object, and could never culminate at all, or pass into the Infinite, unless its object did so too. In every case, we find that the faculties and susceptibilities of a being tell true, and are the exact measure of the outer life it has to live; and just as many and as large proportions as it has to just so many and so great objects does it stand related, so that from the axis of its nature you may always draw the curve of its existence. Human worship, therefore, turning to the living God, as the infant's eye to light, is itself a witness to Him whom it feels after and adores; is is "the image and shadow of heavenly things," the parallel chamber in our nature with that Holy of Holies whither its incense ever ascends.—James Martineau.

## THE FAULTS

OF THE

## REPORT OF THE SELECT COMMITTEE

ON

## DEATH CERTIFICATION.

BY AN M.D.

SINCE the article on "Death Certification as an Aid to Crime" appeared in the FAMILY DOCTOR, several of our large daily newspapers have thought fit to comment on the subject, and the matter used has been mainly a hash-up of the substance that I put before my readers.

The Select Committee have now presented their reports to Parliament, and state that they have sat some twenty days, and examined about thirty witnesses. I will first point out that a "Select Committee" of the House of Commons is by no means the same thing as a "Royal Commission," the members of the former being all drawn from the "House" itself, whereas a Royal Commission includes, as a rule, outsiders who take a deep interest in the subject, even if these persons be not members of Parliament. One thing that must strike all readers of Parliamentary reports is that "select" committees are apt to view all matters that come under their notice from the point of view of the permanent official, whose attitude towards the subject under his care is familiarly known as "red-tapeism." This committee is neither better nor worse than its predecessors, the evidence it has taken is *par excellence* the official view, but we must be thankful for small mercies, and tenderly gather up and consider these official crumbs, and if, happily, we can find some sustenance and comfort from their digestion, it may help to allay the pangs of terror that have been aroused by the evidence produced.

The proposals I put forward in my former article have to a great measure been adopted.

## UNCERTIFIED DEATHS.

The committee are of opinion that the medical officer of health for the district should be called upon to inquire into the cause of each uncertified death, and further "recommend" that he should devote the whole of his time to his joint duties. Quite so, but we are afraid that this will not be carried out on the plea that the extra burden that will fall on the ratepayers of the district in having to provide the extra salary that must be paid to get the medical officer to devote his whole time to the joint duties. At present the vast majority of medical officers of health engage in private practice, and if the duties of "medical certifier" are added, the outcry, which is already vehement against these officials practising medicine privately, will become all the more acute; but from where will the salary come that will induce them to relinquish practice? Here is the remedy. Let the Local Government Board divide the country districts up so that the salaries then paid will, say, reach the sum of £300 per annum (net), and then let the intended local boards agree, with the consent of the Local Government Board, on the candidate most suitable for the appointment, and bar him private practice. If the district be too wide and the work not sufficient, then throw in the office of poor-law medical officer as well. You will then get a sound body of officials, free from the trammels of private practice, to carry on all you wish.

The grievance of private practitioners against medical officers of health, who carry on in conjunction with their official duties private practice, cannot be entered into here; suffice to say, put briefly, it is this:—They use their official position for their personal benefit, and from the nature of the work it is impossible that they can do it unbiased or satisfactorily. Some startling evidence could be advanced on this matter, but, as we have said, it is outside our range at present.

PERSONAL INSPECTION.

The Committee further report that each medical man certifying death must first satisfy himself from inspection that death has actually occurred. So far so good. But they go on to state that if, on account of "distance or other sufficient reason," he be not able to inspect, then he must be furnished by a certificate from two persons, one of whom must be householder, that death has actually occurred. In the writer's opinion it would be much better if the certificate were left out of the question, and another method adopted. Suppose you get a death of a very poor person, some twenty miles away from the doctor—and such things frequently occur in England; now the doctor objects, on the score of distance, to go over and see the corpse, because he knows that no one will pay him for his journey, and can you reasonably expect two poor relations to travel twenty miles to certify. Otherwise, supposing the person was "done to death," would it not be the simplest matter in the world for the perpetrators to bring up a forged certificate, and the forgery would hardly be discoverable, the signature not being known to the doctor. The remedy we suggest is this:—Let the fact of the verification of death be left (when from any reasons the certifying doctor cannot inspect) to the village constable. He has sufficient sense to do it, and it would naturally fall amongst his duties. He is the person who at present notifies the coroner—*i.e.*, he is qualified for this new work.

DIRECT TO THE REGISTRAR.

The medical man must forward the certificate direct to the Registrar.

TO BE PAID.

The certificate, in view of the extra work in the "viewing" of the corpse, must be paid for at the rate of 2s. 6d. each certificate. This is only right and proper. The state in no way helps a doctor through his examinations, nor does it protect him against the innumerable army of quacks and unqualified persons, nor does it, as in Germany and France, State-aid the science of medicine in any form, therefore it has no right to call on him to work for nothing. What is compulsory without recompense, even in this world of philanthropy, is seldom done well.

CERTIFICATES.

These must all be on the prescribed official form, and only one certificate must be granted by the medical man, and the certificates must be all numbered.

Certain cases will be made non-certifiable by a medical man, and he must have attended at least twice on the deceased person, one attendance must have been within the last eight days previous to death, before he can certify.

This last item is absurd. Matilda Clover's death would have legally been certifiable, and practically undiscoverable, if Dr. Graham had given the certificate, because, if my memory serves me correctly (it matters not if I am a few days outside the mark) she consulted that gentleman for alcoholic symptoms within a week before her death. Now, supposing Dr. Graham had viewed the body (it would have been the same in the case of any other practitioner), her state a short time after death, when the rigidity had gone off, would not have told any tale of a violent death. Three days ought to be the limit, and many practitioners keep within that time already. But if a medical man cannot certify, then on a certificate from the gentleman being forwarded to the coroner that he has been in attendance—say a week—and three weeks before the date of death for some definite ailment likely to prove fatal, then it shall be at the coroner's discretion to order a post-mortem only, and the objectionable routine of an inquest would be unnecessary, providing it was found that death was due to what was surmised or diagnosed during life.

STILL-BIRTHS.

All still-births after seven months' gestation must be registered.

Pits and common graves must be abolished. After the evidence addressed this is the least that could be done.

Our review is now complete; the writer would be sorry to say that the recommendations pleased him not from any squemish ideas alone,

but for the very good reasons addressed herein, and because I think, with all right-minded people, that that which you cannot give, and is so easily taken away, and is most precious to all sane mortals, ought to be safeguarded by every possible fence. See what an outcry arises from thousands of voices if a person whom twelve of his countrymen have pronounced guilty on the clearest possible circumstantial evidence of murder, is about to be hanged, least say these worthies a life should be taken away innocently, and yet there is no doubt that hundreds of little babies are murdered, and much crime sheltered behind our present system of registration. If you doubt the writer, read circumstantial evidence produced before this Select Committee and judge for yourself."

VEGETARIANISM AND FRANCE.

(By Dr. BONNEJOY in the *Journal de la Santé*.)

AS regards the diatetic aspect of vegetarianism, France, it is said, is behind all her neighbours, even as Europe, which has taken it up only during the last half century, comes far behind both the temporal and lasting vegetarianism of Asia.

Again, with us, even the *savants* of the Academy, who take upon themselves to judge, are no further advanced in its principles than the average necrophagous individual, or, to give him a more euphonious title, let us say, than the average meat-eater. With the former, as with the latter, a "vegetarian" is one whose food consists solely of vegetable; but this is surely not the difficulty of M. Sée's position, who is a man of great medical attainments, for that implies ignorance of the fact that "vegetarianism," a word of English origin, is not derived etymologically from the word "vegetable," but from the English root "veget"—vigorous, lively, active, which is itself derived from the Latin *vegetus*, as in Horace's line, Book II., Satire II.

"Alter, ubi dicto citius curata sopori membra dedit, vegetus prescripta ad munia surgit." [After a short slumber it has arisen to resume its duties.]

It follows from this, without question, that a "vegetarian" is a vigorous person, not one who maintains a vegetable diet. This latter qualification applies only to "vegetarians" or "legunists," with whom it is truly astonishing that they are constantly being confused; and our colleague, M. Paul, has not failed to do this in his studies of vegetarianism, when he publishes on the side of the truths upon which his doctrine is based certain sophisms in support of a flesh diet which have already been refuted a hundred times.

The Bible is essentially vegetarian, even in the first chapter of *Bereshith* or Genesis; this is abundantly proved by the numerous works of our neighbours on the matter, for France is no factor in the discussion. The treatise which I published in 1891 in Baillière's "Contemporary Scientific Library" is not, perhaps, of great importance when compared to all the vegetarian literature of our neighbours, but it is absolutely the first complete work in our language by a member of the medical profession.

Now, M. Sée professes that an exclusive vegetarian cannot live long! A tremendous error, which one is astonished to see clothed in the light of the Academy, and particularly by a Jew, a descendant of those to whom the Bible itself was given in times past. I refer him, among others, to the first chapter of Daniel, with which he ought, however, to be familiar. For the rest, I have pursued the study in my book, which was not long since presented to the Academy by Dujardin-Beaumetz.

Another example of error on the part of the supporters of flesh-eating, is this:—Formerly it was admitted without dispute that cholera, which is at this moment paying another visit to the meat-eating community, always sparing the vegetarians or "robust in health," transmitted itself through the air. This is logic, and is in keeping with what one observes of its progress. Now, our carnivorous *savants* have changed all this, and it is the water that is charged with crime.

At the Academy this is an article of faith;

the truth is this:—It is not only to-day that the water of the Seine, for example, gives diarrhoea to those who drink it, but from that to the cholera is a long step. It only gives a very great predisposition to the bacillus of Koch, which, absorbed in the air, is transmitted in microbous clouds which travel like other matters.

But our *savants*, sufficiently inclined to the practice of flesh-eating do not see that they are arrested by the water, neither do they wish to swerve from the theory. However, they behave as if it were the air, and this is what one reads in a medical journal—a state of things which would be absolutely insane if there were any reason in the water theory. It refers to a visit of the President of the Chamber to a deputy stricken with the epidemic.

"Before entering the chamber set apart for cholera patients, M. Floquet is obliged to conform to the regulations, which forbid any person approaching such patients without first being enveloped in a long linen blouse, fastened at the neck and falling to the feet."

Encased in this anti-microbic armour, the President of the Chamber approaches M. Dumay, with whom he converses for several minutes. On going out, M. Floquet is obliged to allow himself to be disinfected with sublimate.

It is a fallacy, like the Morocco robe, and the parrots' bill at the time of the plagues of the Middle Ages, that my colleagues have got hold of, but to those who have had, like your servant, thirty years of medical experience, and who have attended cholera patients and others, without arraying themselves in this "blouse," which is no safeguard whatever to the lungs, without being otherwise encumbered, and without terrifying their patients with this suggestive and frightful "get up."

M. Paul has refuted the strange anti-vegetarian assertion of our Academician by proving that on this thickly-populated globe are "vegetarians" as well as "vegetarians"; and one is astonished at the ignorance of blind interest with which the supporters of a meat diet inspire their champions; it is by this very circumstance that it is judged!

I have no desire to re-publish my book in these columns, and I refer my readers to it. I only aver that carnivorous living is unhappily the forerunner of alcoholism, and that it is absolutely impossible to uproot one while countenancing the other; the budget is augmented by it, but if alcohol is a good taxpayer, it is also an energetic factor of depopulation, of murder or madness, and other social evils.

Our beautiful France, which is diminishing rapidly, has not, according to statistics, a hundred years before its disappearance, as in the case of Poland, that proverbial "kettle of fish!"

How, then, can one justify the use of meat as food? I am persuaded that Professor Paul, like every good patriot, ought to associate himself with me to advise him on the matter of vegetarianism, which alone can save our country. May all the vendors of alcoholic poisons perish of starvation!

MORAL courage is a rare phenomenon, rare indeed. We resolve upon performing some great, though painful duty, but at the first dissuasive word of friend or relation, our resolution is shaken. What, say they, will you take all that trouble and incur all that risk when you can escape it? Will you risk position or profit for an idea? Nonsense! Sentiment! Romance! Such folly is out of date in the present enlightened age. The true philosophy of life is to look out for No. 1. Let things go as they go, when by interfering you would give offence and expose yourself to getting into trouble. Men, they go on to say, are too matter-of-fact and too wise now even to respect you for your independence, for your defiance of public opinion, when you think that that opinion is blundering and debased, or for your forgetfulness of self when higher interests are involved. They only laugh at you and think you are a thorough fool. And before that fear of being thought foolish our moral courage, which but a few moments before had been wound up to so high a pitch, relaxes and melts away as snow before the sun; we abandon our noble purpose, we go with the stream.

## THE GREATER INTEMPERANCE.

By C. H. S., M. D.

WE talk about temperance as though abstinence from alcohol were the fulfillment of the law, but there is a greater temperance yet to come, more in accordance with the dictate of an enlightened reason. There is more than one kind of intemperance, and a molicum of observation would show that disgraceful outward conduct by no means gives the full measure of danger that menaces society.

The sin of over-eating produces as much or more trouble to the community than that which comes from the use of alcoholic drinks. The use of tobacco is the occasion of harm second only to that of alcohol. The evil wrought by the excessive use of coffee is by no means one of the minor ones. The baneful effects of the coffee habit in Brazil are equal to that of the beer habit among the Germans. The use of opium and other narcotics is another fruitful source of injury to the community.

The evils of overwork and worry do not fall far behind—in fact, we exhaust ourselves every way in our work and in our play, in eating and drinking, and even in those athletic efforts that are supposed to be hygienic and recuperative. They are all made too intense, and therefore we do not live out more than half our days, and that half we do not live either comfortably, or with that fullness and richness of life which we might. Furthermore, these very excesses are the occasion of much of the demand for alcohol to drown the nervous rebellion that would otherwise shield us from the result of our own foolishness. In confirmation of this, look at the immense amount of disease that runs riot throughout our land.

As evolutionists it is permitted us to look forward to the time when an age of temperance, an age of cleanliness and purity, an age of freedom from tobacco, an age of sanitary reform, an age of plain living and high thinking, an age of health, which is holiness, shall have so regenerated man that he will walk the earth one hundred years and more. Then the time will come when he shall seek health by obedience to law, both physical and moral, and we will have entered upon a higher plane of life, and thus will be fulfilled man's true destiny.

## DISEASED FLESH MEATS.

AS we look over the daily papers and medical journals, it becomes notable, indeed, that there is a large amount of diseased meat sold every year in the large cities. In the great wholesale markets, where tons are sold every day, diseased meat can very readily pass the casual inspection, and be turned over to the consumers with little thought of the suffering and distress that may follow its use. There is certainly more diseased meat on the market than customers are aware of. Typhoid fevers, tuberculosis, and other kindred diseases are disseminated without a second thought of the moral responsibility in the matter. Indeed, we cannot expect it otherwise as long as disease reigns and professional vendors are working for the "almighty dollar." After the consumer has suffered, it is very little consolation to know that there are laws prohibiting such criminal transactions, and health officers and inspectors to carry out the law. The latter, however, are derelict in their duties, from carelessness possibly, but more likely from the fact that they do not relish the disturbance caused by rigidly enforcing the law. There is probably no highly civilised country that is so remiss in maintaining health regulations in this respect as is our own.

From the following report we are pleased to note that the matter of selling diseased meat is becoming some attention:—

"Numerous diseased meat cases continue to be reported. At Leeds, on May 26, A. M. Twamley, pork butcher, was fined £10 for having in his possession ten pieces of pork which were unsound and unfit for human food. At Darlington, on May 16, fines of £10 and costs, or two months' imprisonment, were imposed on Thomas Scott and Robert Gladwin, who were joint occupiers of a slaughterhouse, and who had in their possession six pieces of

meat which were diseased. At Brighton, on May 30, a fine of forty shillings was imposed on a provision dealer, upon whose premises some beef infected with tuberculosis had been seized as it was being made into sausages. The butcher who supplied the meat had previously been fined £10. On May 31, at Glasgow, a farmer and cattle dealer was fined £7 for having consigned to the Glasgow Meat Market, for sale as human food, a side of unsound beef. On the same day, and in the same Court, a provision dealer was fined £10 for having exposed diseased pork for sale. The pork was in a shocking state, being simply alive with maggots. Another bad case was tried at Salford, on June 11, when a butcher was sentenced to three months' imprisonment for a second offence. From the frequency with which these prosecutions take place, it may be thought that the sanitary officers prevent any diseased meat actually being sold, but Sir Benjamin Richardson's article in the *New Review*, and the frequency of pork and other meat-pie poisoning cases, will knock this reassuring theory on the head."

## THE PHILOSOPHY OF HATS.

OF all the items of personal appointment, the hat is surely that which most deserves our consideration. Covering and enclosing the brain, the seat of thought and sentiment, as it does, it may, in some measure be looked upon as the guardian of the soul. According to its particular shape, the manner in which it is worn, as to whether it is lowered over the eyebrows, thrown back on the neck with the brim heavenwards, thrust over the ears, tilted towards the right or the left, we may, with more or less certainty and precision, deduce the degree of intellect, the shade of humour, the proclivity of mind, the waves of emotion, of him who wears it. The shape is certainly not enough to open up to us the intimate nature of the Ego, but it furnishes us with valuable indications in that it allows us to make a classification of types into two distinct categories—namely, turned-up brims and flat brims, which are, in fact, the two extreme types, which, by their polar opposition, characterise the permanent struggle which exists in Nature between the *active* and *passive* principles.

The turned-up brim, a virile symbol of omnipotence and of the manifestation of the Ego, indicates a tension of fibre, a concentration and activity of will tending to the external materialisation of thought; it is the certain sign of authority and hierarchy. It suggests the sentiment of order, continuity, method; an aspect of pride and self-sufficiency, denotes the desire to shine, dominate, and command; ambitious, a lover of power, apt in the administration of business, riding over social conventionalities, he does not consent to abolish etiquette; he loves representations, grand shows, receptions, and honorary distinctions. The turned-up brim generally suits accentuated profiles; an aquiline or curved nose, prominent cheek-bones, long, advancing chin, close-set ears, trimmed moustaches, and well-dressed beard; those who wear this kind of hat have a clear, sonorous, commanding voice, a confident walk, a well-knit figure, with a full chest; they show the results of figure-training, and their well-adjusted garments give them a good appearance.

In the hat with a raised brim is suggested at once the majesty of the crown of Olympian Jove and the casket of Mars, together with the eccentric and coxcombical head-dress of the king of the clowns; here there is a mixture of Jupiter and Punchinello.

The flat brim, on the other hand, type of feminine passiveness and reflection, indicates a certain relaxation of fibre; the will, half-active only, falls in concentration, and is dispersed over a thousand things; there is originality, caprice, tending to the contempt of a hierarchy, to everlasting mobility, and all the marks of eccentricity. Without ambition, somewhat Bohemian, and undisciplined, the flat brim despises social conventionalities and Mother Grundy; it loves the unconstrained, the frankly artistic temperament which it bears leads it to make verses. It is very rarely, indeed, that the flat brim does not contain a poet, a writer, a painter, or a musician, but,

then, with a more or less accusing taint of disorder or incoherence. The imagination, lonely and subtle in its shifting versatility, is filled with the greatest sorrow or high jubilation, as in a troubled sky descend alternately dark clouds and blinding flashes. The flat brim, in fact, takes after Phoebe, its patron saint: it is lunatic?"

This kind of brim is generally found with round faces, well-developed at the temples, short nose, sparse soft hair, ears standing out from the head, the chest narrow and receding, shoulders large, fleshy, lightly bent, or low and falling. A shadow of timidity gives to the voice a want of resonance, and the walk is irregular; the clothes have a comfortable amplitude. Here is at one time the effect of Venus and the moon; there is about it a serio-comic aspect which resembles the moving attraction shown by the powdered mask of pantaloons.

Let us now discuss the philosophy of the high hat. Whether it have a flat or a curved brim, it is universally admitted to be the head-dress select for great days in our civilised world; in particular, the unimportant citizen and the artisan wear it in all its architectural magnificence at public rejoicings or private events, whilst the man of the world, under similar circumstances, occupies himself in reducing it to the shape of an accordion portable under the arm. Besides the chimney-pot and the Gibus, is the modest round hat. This is the universal *conceivable* symbol *par excellence*, a type of the bond which unites all things, mind and matter: it is the knot which combines or disjoins; popularly named *melon* (doubtless from the naive simplicity it imparts to the countenance), the round hat is in the same way the common ground on which the two extreme classes of society occasionally unite. Under cover of this neutral element, which keeps a just balance between the two extreme points, the man of the world may be easily taken for his valet, and the valet for his master.

This light, lively-looking little hat bears some resemblance to the winged head-dress of Mercury, the messenger of the gods. It also approaches the hat of harlequin in appearance—it is extremely convenient for business people, for travellers, for servants, and for young men who wish to elude vigilance. Quick, active, sporting, it is the outward manifestation of geniality, of invention, of activity, and under a careless guise it conceals the perspicacity and persuasive tongue of the commercial traveller and the cunning of the clever merchant.

The soft hat, in its protean forms which pass so easily from the conquering dramatic wiles of the *mousquetaire*, and of the *sombrero* to the coquettishness of the *brigand* of comic opera, or the rustic simplicity of light lovers, was the result of strong sentiment of the fortune-hunter, the jolly fellow, the misunderstood artist or patriot. Nowadays, when artists are content to be like other men, when everyone is more or less anarchical, socialistic, or republican, the soft hat has lost its prestige, and only adorns the unkempt heads of ostracised Bohemians!

As to the straw hat, it is to the silken or felt hat what the feather is to down. Fashion has reduced it to proportions so unimportant that it no longer keeps off sun or rain; it is the hat universal at three and six. Covering all heads, from that of the financier and the academician to that of the artisan and labourer, it has no sex, for woman herself has adapted it for use.

Cheerful and unconstrained, with its inviting suburban gaudiness (as is compatible with republicans, democrats, socialists, &c.) the obtrusive boating-hat of the riverside has replaced the solemn Panama which formerly flourished, and to which recent events have given the *coup-de-grâce*!

"But," I hear you object, "if fashion exercises so much influence on the shape, what becomes of your philosophy?" I reply, "The shape, remember, gives us the elements for a general classification; it is only in the manner of covering the head that we shall truly find all the intimate shades of individuality of each type. If fashion changes, what does it matter!

TO TOBACCONISTS (commencing).—Illustr. Guide, 259 pages, "Post Free." How to Commence, £20 to £1000. Tobaccoist's Outfitting Co., 185, Euston Rd., London. Manager, Hy. Myers. Est. 1866. Smoke "Pick-Me-Up Cigarettes."

Fashion is only the resultant of individual feelings, which, by their union, constitute the manners of the time, and for this purpose affords us a valuable indication. If, for example, flat brims predominate, so, verily, fashionable feeling sets to flat brims; very well, it is because the social movement is in the direction of art, imagination, and fancy, and the sentiment of authority and hierarchy grows feeble and wanes.

There would be more pantaloons than clowns, that is all!

## SHOULD COUSINS MARRY?

FROM A MEDICAL POINT OF VIEW.

CONSANGUINITY in marriage is still a much debated topic. A great number of physicians are opposed to unions of this kind. Yet, consanguinity being only a special case of heredity, it is generally held nowadays that if husband and wife as well as their ascendants are of a healthy mind and body, the result will be good: in the opposite case it will be bad. Regnault is of opinion that not only the descent of husband and wife produce a consanguinity, but also their sojourn under the same conditions, while, on the other hand, it may happen that relatives living separated by space should cease to be regarded as consanguineous, being able to intermarry without the character of consanguinity. It has been pointed out that in most nations severe laws have been enacted against marriages between relatives. Regnault, on the strength of his investigations, thinks that the nations have endeavoured with at least equal energy to prevent intermarriage between individuals living in the same place without being relatives, *i.e.*, topographic commingling. As instances the author quotes the Indians of North America and the Australians, who used to get their wives far away from their own tribal district. In France, and probably elsewhere, it has been noticed that the strict observance of the religious prohibition of marriage between relatives decreases in the same proportion as the number of marriages between individuals of the same locality. The latter decrease is connected with the increasing facility of transportation. In the middle ages marriages were prohibited between relatives even in the seventh degree, and kings themselves obeyed this law. In the last century the Church limited her prohibition down to the fourth degree, and in the present century cousin-germans are allowed to contract matrimony, although with special dispensation. The author explains this disappearance of the laws against marriages between consanguineous persons by the fact that by the progressive and unceasing commingling of individuals topographic consanguinity came to an end by itself. In France there are some localities constituting an exception to the rule, such as Pollel, Boury de Batz, Fort Modyk, where marriages are strictly limited to people of the same place. At Orthez, where this rule existed among the Protestants, epilepsy had become endemic and inevitable to such a degree, that each house contained a special room provided for it. After the railways had led to intermarriage with Protestants of other localities, epilepsy has decreased in a surprising manner. Observation, of the same kind have been made in animals long ago, and Cornevin quotes a striking instance of this fact. Darwin points to the habit of agriculturists who, for the purpose of improving the quality of crops, will always employ seeds from other localities. The fact that consanguinity in a marriage between two persons having lived in different localities is of minor importance, should determine a physician consulted about the opportunity of a marriage between relatives not only to consider the blood-relation, but also the topographic circumstances. Provided both parties are strong, healthy, and without taint, any possible objection to their union will be lessened by their not having raised in the same locality and under the same conditions.

The skeleton of a man weighs from twelve to sixteen pounds, and the blood twenty-seven or twenty-eight pounds.

## THE HEALTH HABITS OF DISTINGUISHED MEN.

ONE SECRET OF HENRY WARD BEECHER'S POWERS OF ENDURANCE AS GIVEN BY HIMSELF.

HE says:—"I have been asked, sometimes, how I can perform so large an amount of work with apparently so little diminution of strength. I attribute my power of endurance to a long-formed habit of observing, every day of my life, the simple laws of health—and none more than the laws of eating. It has become a second nature to me. It ceases any longer to be a matter of self-denial. It is almost like an instinct. If I have a severe tax on my brain in the morning, I cannot eat heartily at breakfast. If the whole day is to be one of nervous exertion, I eat very little till the exertion is over. I know that two forces cannot be concentrated in activity at the same time in one body. I know that when the stomach works the brain must rest, and that when the brain works the stomach must rest. If I am to be moving around out of doors a good deal, I can give a fuller swing to my appetite—which is never exceedingly bad; but if I am engaged actively and successfully in mental labour I cannot eat much. I have made eating with regularity, and with reference to what I have to do, a habit so long, that it ceases any longer to be a subject of thought. It almost takes care of itself. I attribute much of my ability to endure work to good habits of eating, and constant attention to the laws of sleep, physical exercise, and general cheerfulness."

## THE NEED OF RESERVE FORCE.

(Specially Written for Women.)

By J. CHANDLER.

I WANT to say something about reserve force in this Paper and its relation to hygiene. Reserve force is the strength left over after one has done her work. If a bridge builder builds a bridge he calculates how heavy a load it will need to carry and then makes it, not only strong enough to carry this load but a great deal more. None of us would feel comfortable in going over a railway bridge if we knew the builder had not made it with a great deal of reserve strength never to be called into use.

It is so with our bodies, they have usually considerable reserve power not called out by the ordinary daily tasks we put on them. We admire a woman who has reserve force for all emergencies; we know she can do her ordinary work, whatever it is, with ease, and hold out well in the race of life. But it is much easier to estimate the amount of strength required in a bridge for a certain place than that in our muscles and nerves. We can calculate the former by mathematical rules, but not the latter. There is no mathematics which will tell a woman just how much she can endure with safety, and how much will break down her constitution and ruin her health for ever, so they often take on themselves care and work beyond what they have any right to do. There is a tendency of our time to push everything to the limit of endurance. My suggestion to women whose reserve force is not great is to husband it well, accumulate it by right food, abundant sleep, and frequent short vacations. Guard it carefully, instead of drawing upon it daily as so many do who become feverishly anxious to accomplish some undertaking. The successful athlete carefully measures his resources, and if his race is to be a long one, nurses his reserve powers. If he engages in a race he does not over-exert himself at the start, but so regulates his expenditure of energy that he shall have an abundance left for the finish. That is precisely what women should do who are engaged in any hard work. Every woman, high or low, who labours daily is engaged in a long race, which is in part a test of endurance. She should so measure her pace as to have always at command some reserve power. She should not undertake to do more than she can without undue fatigue, and she will be able to do more, for a short time at least, when occasion requires the extra exertion. Just as we see the

swift runner exhausted before the race is half over, and beaten by his slower but more enduring competitor, so we see women over-taxing their powers when young, and growing old and feeble while young in years. It is the reserve power that tells in prolonged contests—the reserve power of muscle, of spirit—for she who exhausts herself in any kind of effort is unable to withstand the slightest added burden and succumbs to a force she might easily have resisted if she had kept her resources well in hand.

In these days, when women are entering almost every occupation in competition with men, often driving them from their work because their services cost less, it is important that women guard and protect themselves by a large accumulation of reserve power.

## HISTORY OF THE MANUFACTURE OF SOAP.

IF we inquire into the origin of the manufacture of soap, we find that a detergent corresponding to our soap is not mentioned by any writer before the Christian era. It is frequently asserted that soap was known to the authors of the Old Testament; but the Hebrew words used in the passages (Jeremiah ii. 22, and Malachi iii. 2) are stated by authorities to refer to vegetable and mineral lyes—*i.e.*, potash and soda in some form.

In the time of Homer washing of clothes was effected without the use of soap, as he tells how Nausicaa and her attendants washed clothes by stamping them with their feet in pits filled with water.

In time, however, juices of plants were used as detergents, and also natural soda and wood ashes; Paulus Aegina had discovered that by adding lime to alkalies their strength could be increased.

Fuller's earth was, however, the principal agent used for washing in ancient times, the fuller's art being due, it appears, to one Nicias, the son of Hermias. At one time Fuller's earth, found of a superior quality in Staffordshire, Bedfordshire, and other counties of England, was considered so indispensable for the dressing of cloth that, to prevent foreigners from rivaling English fabrics, it was made a contraband commodity, and its exportation made equally criminal with the heinous and wicked export of wool.

The Gauls made a soap out of goat's suet and beechwood ashes, and used it for dyeing the hair red. It is supposed that this soap was an oily mixture used also as a salve in eruptions of the skin and similar diseases. The Arabs used salve-like product, obtained by mixing olive oil and lye, for affections of the skin, as well as for household purposes. As a detergent, soap is first mentioned by authors of the second century after Christ. The celebrated physician Galenus speaks of it as a detergent, as well as a medicament, and considers the German soap as the best, and the Gallic as the next best. The next we hear of soap was in the ninth century, made in Marseilles.

Till Chevreul's classical researches on fatty bodies (1811 to 1823), it was believed that soap consisted simply of a binary compound of fat and alkali. Claude J. Geoffroy, in 1741, pointed out that the fat or oil recovered from soap solution by neutralisation with a mineral acid differs from the original fatty substance by dissolving readily in alcohol, which is not the case with ordinary fats and oils. The significance of this observation was overlooked; and equally unheeded was a no less important discovery by Scheele in 1783. In preparing lead plaster by boiling olive oil with oxide of lead, and a little water—a process palpably analogous to that of the soap boiler—he obtained a sweet substance which, called by himself "Oelsuss" (*Principium dulce oleorum*), is now known as glycerine. The discoveries of Geoffroy and Scheele formed the basis of Chevreul's researches, by which he laid bare the constitution of oils and fats, and the true nature of soap.

From the first part of this century up to the present time soap-making has been advancing, but it is not to its highest point yet, and we must try to make as good a showing in the next twenty-five years as has been done in the past.

## A VISIT TO A CONSUMPTIVE HOSPITAL.

I HAD an opportunity a few days back to visit one of the most homely and comfortable hospitals I was ever in. It occurred like this. I was touring around the coast, and became very friendly with a well-known medical man. "Have you ever seen my family at home?" he said. I confessed I had not, and expressed a desire to be introduced. "Well, come along," he added, laughingly, "but the ceremony will be rather lengthy, for there are over forty of them!" "What! children," I exclaimed. "Yes," he said, "children," and I then perceived that the doctor, to use a common phrase, was "getting at me." Hailing a cab we drove up to what appeared a private house, very pleasantly situated in its own grounds. "This is my home," he said, "and forty little children are my charges. It is not a hospital," he continued, "but a home in a true sense, for there are but three children in each room—we have no wards. It is arranged upon the Continental system, and it is a pity this system cannot be more generally adopted although this is rendered practically impossible by the price of land." "Do you give these children medicine?" I inquired. "Well, no! only when they practically require it, for I can scarcely call the daily administration of Oppenheimer's Cream of Malt with Cod-liver Oil and Hypophosphites medicine. It is a highly-concentrated food. I find the children like this preparation—even when they reject all other forms of cod-liver oil!" "And how do you know when the medicine, or food as you call it, is doing good?" I asked. "Easily enough," was the reply, "for we find increase of weight, which is a result both of the flesh-forming and bone-producing properties of the preparation." "A splendid home, and a splendid work, doctor," I added; and I left the benevolent old medical with a feeling that in health I had something to be thankful for after all.

## OUR OPEN COLUMN.

### CORRESPONDENTS' OPINIONS.

#### A VICTIM OF FIGURE TRAINING.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I came across a case of a boy being kept very tightly laced, which may interest your readers. A lady here had twins. When they reached eleven years of age the girl died, so she determined to bring up the boy with all the care she had lavished on the girl. He is a pretty child, with fair curls, a delicate pale complexion, a neat shape—though inclined to stoutness, which in spite of careful dieting, a fair amount of walking exercise, and the constant restraint of tight stays, is gradually getting a pronounced embonpoint below the waist. This is a constant annoyance to his mother, who tries by every means of supporting belt and semi-starvation to reduce the size of his figure at this point. He has a remarkably feminine appearance, which was much remarked on by the people who had tea with his mother a few days ago. She quite dotes on this, her only child, and hopes he will one day be a great artist, for which art he has great aptitude, though he is never to be allowed to go to school, his mother being afraid of the contact of rough schoolboys. He came down to tea, dressed in black velvet knickerbockers and jacket with broad soft collar. The jacket was cut tight to his figure, and confined at the waist by a metal belt, which showed off his wonderfully slender waist and well-laced figure in a perfect fitting corset. The three fashionable young ladies present were surprised, and far from pleased, to find on measurement their waists were all nearly two inches bigger than that of the plump, picturesque boy with long silky curls, pale fair complexion, and small girlish hands. He is always dressed in the morning in an exquisitely moulded corset, that preserves his tiny wasp waist to its usual size, in spite of the plump proportions of his

## FAILING EYESIGHT.

Thirty years' practical experience has proved Mr. Bluett's system of sight testing by examination of each eye separately to be the only perfect method of accurately determining the lenses required to restore the vision, and make reading or working a pleasure.

Consultations Free. Spectacles at Store prices.

**F. J. BLUETT,**

Specialist in Spectacles, and author of "Defective Vision, its Cause and Cure."

(FOUR DOORS FROM OXFORD STREET.)

shoulders, arms, and neck. His hands will never lose their pretty shape and colour, night gloves being part of his dress, besides well-fitting long dogskin, worn a large part of the day, partly to keep his hands small and delicate, and also to preserve their whiteness. Unless I am much mistaken, his delicate clear skin is not only indebted to his pinched figure and the pain inflicted by his stays, but also to the use of cosmetics by his mother when she sees him to bed. It is extraordinary that his mother does not see what a bad effect on his health her extreme system of lacing is producing.

Grand Hotel, Glasgow.

CORSET.

### FIGURE TRAINING.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I hope you will allow me space to express in the strongest terms my agreement with "Marielle" on the subject of tightness and pointed shape as elements of prettiness in a lady's promenade boot, and also as to their excellent training effect. Looking over your back numbers, I find there are a number of other readers who have expressed the same views. For instance, in November, 1890, a lady who confesses to wearing the most pointed boots that she can coax her toes into, says at the end of her letter, "One word more in favour of the pointed toe and high French heel. They compel the wearer to assume a pretty, dainty mode of walking which is most becoming, and also an erect and stylish carriage of the whole figure." "Eperon," a little later, declares that, "There is a piquant charm about a very tight and pointed little high-heeled boot which nothing can excel," and a little further on a lady mentions the excellent effect such boots have had with her daughters. Numbers of others could be quoted to the same effect, both from those who have observed the effect on others and from those who have experienced it in *pro pria persona*.

By the way, I noticed in my searching that in a letter in the number of March 9, 1893, "Moderation" mentions that she does not wear tight boots, though she would like to as they are pretty.

I wonder whether when "Marielle" lightly remarks on the excellence of "the discipline régime" for "driving the awkwardness out of hobbledehoes," she has any idea of the bad quarters of an hour (or good deal more) sometimes spent by the "hobbledehoes" in the process. To take a lad without the slightest warning from his rough freedom, and lace him up in a tight, long-waisted corset, boned and steeled to the stiffer, strap back his shoulders, case his hands and wrists in long, tight white kid gloves, which he is required to keep perfectly fresh and unsoiled (a requirement entailing wondrous care), fix up his chin so that he cannot see his toes, and, without any previous training, put him on boots of extreme pointed shape and tightness, perched upon heels of tip-toe height and the most tapering form. To do this, and then straightway punish him for every fault as though he had had the advantage of long training, and stimulate his efforts with the sharpest application of a stinging whip at the slightest falter, is a proceeding which, however beneficial, is hardly the plan which the subject of it would voluntarily select for himself.

CURB.

If trouble comes on him, which prudence could not foresee, nor strength overcome, nor wisdom escape from, he bears it with a heart serene and full of peace. Over every gloomy cavern and den of despair Hope arches her rainbow, and ambrosial light descends. Religion shows him that out of desert rocks, black and savage, where the vulture has her home, where the storm and avalanche are born, and whence they descend, to crush and to kill—out of these hopeless cliffs falls the river of life, which flows for all, and makes glad the people of God. When the storm and the avalanche sweep from him all that is dearest to mortal hope, is he comfortless? Out of the hard marble of life, the deposition of a few joys and many sorrows, of birth and death, and smiles and grief, he hews him the beautiful statue of religion, tranquillity. It stands ever beside him, with the smile of heavenly satisfaction on its lip, and its trusting finger pointing to the sky.—*Theodore Parker*.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

WEEDS.—Will anyone give a cheap and effective recipe to destroy weeds that grow in garden paths?—*Hawthorne*.

LICENCES.—I am informed that it was a Liberal Government which gave the Excise power to issue "beerhouse" licences. When was this, and under what circumstances, and also when and by whom was the authority confined to magistrates only?—*G. A. S.*

ASTRONOMY.—What planets can be seen with the naked eye at, say, ten o'clock p.m.? What planet is it that rises some time about nine o'clock in the north-east?—*H. O.*

### ANSWERS.

CONTRACT.—You can compel the landlord to do nothing unless he has contracted to do it. You have engaged to keep the house in good and tenable condition, and to deliver it up in good repair, fair wear and tear and damage by fire excepted. You suggest that the landlord on these words can hold you liable for wilful damage. This is absurd. You are clearly bound to do all such repairs as will make and keep and leave the house in good repair fit for a reasonable tenant to occupy, who has to make reasonable allowance for fair wear and tear of your previous occupancy.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

THE PHYSICIAN. A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

### ADVICE GRATIS.

By A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

### The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:—

King's College Hospital.  
University College Hospital.  
London Temperance Hospital.  
West London Hospital.  
City of London Hospital for Diseases of the Chest.  
Evelina Hospital for Sick Children.  
Hospital for Sick Children.  
St. Peter's Hospital.

Nazareth House, Ham-mersmith.  
British Home for Incurables, Clapham-rise.  
Ophthalmic Hospital, King William-street, W.C.  
Poor Box—Five Police Courts.  
St. Thomas's Hospital.  
City Orthopaedic Hospital.  
London Hospital.  
Charing Cross Hospital.

H. J. C.—You must tell us your symptoms. "Incontinence" is too broad a term, and conveys no definite meaning. Give us exact symptoms.

CANDIDEN.—There is no application which will make the hair curl permanently. The actual formation of the hair is different in people who have naturally straight and those who have naturally curly hair. No application made externally will cause this fundamental change in structure.

E. S. G.—It is practically impossible for you to entertain matrimonial prospects just yet, without some definite form of treatment. For the present, we should advise you to take a cold bath every morning, having a good rub down afterwards with a rough towel, keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Get plenty of active outdoor exercise, such as running, jumping, and if possible, football, &c. Your meals should be quite light, nutritious, and easily assimilable, and taken at regular hours. Medicinally, we should advise you to take a teaspoonful of Parry's Food three times a day immediately after meals. If you get no better you had better send a stamped addressed envelope.

SALLY.—These pains and discomforts are probably due to your years and consequent want of exercise and strength. If the back of the neck feels cold, we should advise you to use a warm shawl round the neck, and keep yourself out of draughts. The bowels should be duly attended to, and we recommend plenty of good food.

CALADOC.—Of course this sort of things is not natural, and it can only be cured by electrical methods; but do not therefore rush to advertising electricians who are not surgeons nor physicians. With regard to your second query, we do not approve of the method at all, and consider that when young people of that age require whipping, it is due to parental negligence when they were young. It seems hard to visit the sins of the parents past selfishness upon the children, thus completely brutalising the latter.

MATHEW LENNOX.—The only thing you can do is to endeavour to soothe your condition by taking thirty grains of bromide of potassium twice a day, and a pill of two grains of camphor and one of hyoseyamus every night. The medicine may cause a rash, but we see no other way out of the difficulty.

APLIGIDA (Glasgow).—We are unable to tell you the exact cause of this suppression. It may, of course, be due to poorness of blood or anaemia, but there are many other causes. Whenever the general health is affected and the body is below par, this sort of thing is apt to occur. We should advise you to take some warm sitz baths, get the bowels freely open, and take the following medicine: Bromide of potassium two drachms, ammonium citrate of iron one drachm, spirit of chloroform one drachm, water to six ounces. One-sixth part three times a day immediately after meals.

SAM BOTTLE.—No, zinc ointment will not be of any service in this case. It is due to the fact of your suffering from indigestion. You must be careful not to substitute beer for food, as this is a most irregular thing to do. Have your food regularly, and let your meals consist of plain, nourishing, assimilable materials, such as boiled fish or trout, bread and milk, eggs lightly boiled or raw, &c. See that you get a fair amount of active outdoor exercise, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One sixth part three times a day immediately after meals.

COMER.—We know what you mean, but it is a very difficult matter to alleviate. We very much fear that sooner or later you will have to make up your mind to go in for a course of treatment. You had better take a cold bath every morning, and keep the bowels freely open. You must be very moderate in your habits, and avoid intemperance or excess in all possible ways. Take a teaspoonful of Fehle's syrup of hyposulphite three times a day immediately after meals.

NOLL HILARY.—No. These appliances are not likely to attract electricity from the atmosphere, nor are they likely to be of the slightest service to the person wearing them.

ANXIOUS.—This man is an unqualified practitioner, pure and simple. He has no right to practice at all, and his methods are entirely disreputable. Keep your bowels acting regularly by a teaspoonful of compound liquorice powder each night will be sufficient. Stick to your truss, and leave the future to take care of itself. Meanwhile take care of your eight pence, and utilise the sum for your own benefit.

OXFORD.—You had better place yourself under the care of a specialist. To play with such a condition is a mistake, and the treatment which you are undergoing is never likely to give you anything like complete relief. You had better come to London and have the parts properly examined with a view to curative treatment. Meanwhile take a teaspoonful of Epsom salts each morning in a wineglassful of water.

H.M.—We do not quite understand what you mean. If the disease was cured, it would certainly not return after four months, unless you had been exposed to fresh infection. Will you please describe the present symptoms, giving us as many details as possible, in order that we may be able to form a diagnosis. On hearing from you again we shall be happy to prescribe.

RANDOLPH.—Your condition is a very common one, and you are suffering more or less from the effects of former practices. Take a morning cold or tepid bath, walk at least five miles a day, do not sleep on your back, rise to empty the bladder whenever you wake, eat your food slowly, take the following medicine three times a day: Bromide of potassium one scruple, bicarbonate of soda twenty grains, tincture of gentian half a drachm, water to half an ounce. Write to us again, reporting your condition in four weeks.

T. K. H.—You smoke too much, and this habit is probably responsible for the defects described. Cut the tobacco down to an ounce a week, and take the following mixture three times a day: Carbonate of ammonia four grains, bromide of potassium twenty grains, glycerine twenty minims, tincture of bark half a drachm; water to half an ounce.

PAT.—Undercooked mutton daily, fresh fish, green vegetable, it is a mistake to live exclusively on farinaceous food, and to eat mutton as a creed is a mistake. Eat your food slowly, and drink only after each meal is finished.

ARTILIZ.—1. Yes, the morning sponge bath will do you good. Be careful about your diet. 2. The pimples are some of the results of indigestion due to dietary indiscretion. You must pierce the spot with a lance-headed needle (to be obtained of any good chemist), bathe the part with hot water twice a day, and take the following medicine: Sulphate of magnesia twenty grains, bicarbonate of soda fifteen grains, spirit of chloroform five minims, infusion of gentian to half an ounce. We are sorry we cannot be certain that there will be no mark. Use hot water with good soap, terebene or vinolia, for washing the face.

R. WHISKER.—A bottle was sent to us the other day, but it has somehow lapsed from our possession. You might try Burge Yne, Cyreax, Burdighes, & Co. in Coleman-street, E.C. PHILLIPA.—1. No; if you take tea as it is usually drunk by the better classes, not a word wrong, with plenty of milk. Use hot water with a lance-headed needle (to be obtained of the opposite sex for special reasons. It would not affect you in any way unless after a hearty supper. 3. We do not believe in vegetarianism; there is plenty of paper and ink wasted on the subject, if you take the trouble to find it out. We cannot recommend you to take only vegetables, as the habit is almost sure to induce constipation. 4. Fruit-eating is good in moderation on account of the salts contained in fruit, they are not nourishing, and are not absolutely necessary as an article of diet, true cholera cannot be produced by eating fruit, though eating fruit, especially if unripe, in excess is likely to cause irritation of the bowels. 5. No.

D. W. D.—You cannot prevent the evaporation of the camphor, but it does not affect the chalk very much if well pulverised. 2. This preparation is a fair stimulant, and prevents the combustion of certain substances in the body, but it has no nutritive power whatever as such. It does not add any force or tissue-substance, and is, therefore, no substitute for meat. 3. Not much; not nearly so much as there is in milk.

HOPEFUL.—If you had mentioned your former habit before, we should have been able to advise you. This is, of course, the sole cause of your trouble, and unless you discontinue the habit you will never be better. You must take cold baths, and the advice and medicine we have given you before. It is of no use asking advice unless you follow it.

VERAX.—Yes. It is possible to meet with the contagion at public or other conveniences—it may sometimes be caught even in one's own household when visitors who are affected may unwittingly be the source. It is a common trouble, and does not indicate necessarily anything like immoral connection.

VANITY.—You do not say who performed the operation of electrolysis for you. It was evidently very carelessly done, and certainly not by a qualified medical practitioner. We shall be very glad to learn the name of the operator. You will notice that in recommending electrolysis in these columns we especially warn our readers against those incompetent persons who advertise. That an expert never does so. We regret that time must be the only healer in your case, but you will be careful to advise your friends to avoid the perpetrator of the disfigurement.

PERPLEXED.—We are very much afraid you will be unable to entirely cure this so as to be able to lock upon yourself as quite free. Palliative measures may be used, such as dusting the parts with well-powdered boracic acid and oxide of zinc. You may also use a solution of carbolic acid to wash the parts of the strength of one in sixty. Look especially after your general health, take morning cold baths, keep the bowels freely open, and take plenty of active out-door exercise; also be careful to eat plenty of good plain food, and take a teaspoonful of Parry's Food three times a day, immediately after meals.

J. H. F. STENNING.—You must avoid all beer, wines, and spirits, and your diet must be of the very lightest possible kind, and taken quite regularly. Have a warm bath as often as you can in the week, and take the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia two drachms, spirit of peppermint one drachm, chloroform water to six ounces. One-sixth part to be taken three times a day between meals.

CHAS. W. J.—The cause is constipation, and the probability is you are not very particular about your diet, not at the hours of taking it. You should take a cold bath every morning, and use the following medicine regularly: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, chloroform water to six ounces. One-sixth part twice daily between meals.

T. K.—The history given is sad, but we are inclined to think the condition may be amenable to treatment. There is evidence of nervous prostration, but there is more evidence of liver disturbance, and the latter condition will require first attention. We advise you to take the following pill daily with dinner: Blue pill one grain, eucalyptum one grain, pill of oolong and henbane three grains; and the following mixture before each meal: Dilute hydrochloric acid ten minims, bromide of potassium fifteen grains; chloride of ammonium ten grains, tincture of gentian half a drachm, water to half an ounce. We shall be glad to hear again from you in a month's time.

T. SMITH.—We strongly disapprove of anything in the shape of supposed panaceas. The powders named might do no harm in certain cases, but in others they might induce salivation, and so damage the patient for life. To pretend that your idea of selling these things is philanthropic is absurd. Your idea is to make money out of the gullibility of the British public, and we strongly disapprove of it, not only because the powders will in most cases be useless, but because in many instances they will do irreparable damage.

JAS. REID.—Medicines are usually unsatisfactory in these cases. As you have tried medicines for several months, it is probable that your case will not yield to local treatment, and for that purpose you will need to consult a London specialist. Meanwhile persevere with the medicine already prescribed for you.

SHUT.—You certainly describe the ordinary symptoms of stricture. The only certain test is examination by a specialist, and probably the treatment of the stricture will at the same time cure the gleet—the two conditions being closely allied. You will probably need local treatment, and we should, under the circumstances, advise you to waste no time in obtaining the same at the hands of a competent physician.

VIOLIN.—1. We are glad to hear that you are feeling better. The pains may or may not lead to the condition mentioned. 2. This is not unusual in persons suffering as you are. 3. Unless you are restored to health you would be foolish to marry. 4. This consists of prostatic fluid, and is not of any serious importance. 5. Pain, or the absence of it, is no proof that the conditions do not require treatment. We, therefore, adhere to what we formerly advised you.

HOMOEOPATHY.—This is ex-ophthalmic goitre. The complaint is a very obstinate and untractable one, and very little good is done by the use of drugs. We can hardly believe that your friend has not already been under medical men, who have probably tried the chief medicines (not homoeopathically though) employed in the treatment of this affection—viz., belladonna, tincture of iron, digitalis, and bromide of potassium. We fear we can add nothing valuable to the list.

W. OSBORNE.—In your case, if the heart be really affected, walking is the best exercise; but you must not imagine that by doing this or doing that you will be able to increase your height. "No man can be by taking thought, add one cubit unto his stature"—this is an approved scientific truth. Exercise, gymnastics, &c., may open the chest, expand the lungs, and develop the muscles, but it will not give height. However, you will not have finished growing until you attain the age of twenty-five.

AMERICAN READER.—We cannot tell you what this is without a personal examination. The best thing you can do is to consult a specialist on the matter. We shall be very happy to recommend you one if you like.

AMERICAN TRAVELLER.—As you have told us your sex we can now advise you more fully. The head and hair must be first well oiled with white petroleum, and then a cold like ordinary pomade, perhaps an ounce would be sufficient. The hair must then be placed in a rubber cap to protect linen, and the ointment washed off next morning with hot water and soap. Your maid servant must then comb out the hair in small strands with a tooth-comb, and remove every visible (grey) scale. This must be done diligently for three or four days until nothing further is seen. Treat the eyebrows in the same manner. The white precipitate ointment will also stimulate the eyebrows to grow.

DUBLIN MAN.—These circles may be, and are general produced by the body being fatigued or exhausted in some way. Rest, good feeding, sufficient exercise in the open air, and attention to the bodily health generally, avoiding late hours, excessive smoking or drinking, will recuperate you.

J. E. F.—Yes. Drink only after the meal is finished. Continue your abstinence in the matter of smoking, and keep on with the medicine for at least another month. You must have both patience and perseverance in the treatment of these conditions, and it will not do to expect too early a result.

LEX. Take the following mixture after each meal: Pure carbolic acid two minims, tincture of cardamoms twenty minims, tincture of capsicum five minims, tincture of gentian half a drachm; water to one ounce. If you find this mixture hot to take, add an equal part of water to each dose.

## THE CURE OF CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, & CATARRH.  
By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S.,  
Late M.R.C.S. Eng., late Consulting Surgeon to the  
Lower Clapton Orphan Asylum, &c., Lynton House,  
Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

# "MALT-COFFEE"

(PATENTED.)

"The FAMILY DOCTOR will be found of great use in every Household."—Sportsman

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Dose not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much farther than any ordinary coffee; therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin.  
MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

**A TROUBLED ONE.**—You are suffering from hyperaesthesia of the parts, which only local treatment will remove. You might take all the medicines known to the pharmacist without deriving any benefit. We therefore advise you to consult a specialist physician on the subject. You need have no hesitation in the matter, as cases such as yours are not at all uncommon. You will, as you say, do wisely to avoid the "gentlemen," who advertise, and if you wish us to give you the name of a reliable man, we shall be happy to do so.

**F. W. ELDON.**—Probably due to indigestion and politics. Eat less, drink less, and give up politics as a very bad job. Eat your food slowly, drink only after meals, and take a dose of the following medicine each morning, before rising: Sulphate of magnesia one drachm, nitrate of potash five grains, peppermint water to half an ounce. Take a fair amount of out-door exercise, and let us hear how you are progressing in a few weeks' time.

**LILIRA.**—You need say nothing about the matter at all, there being no necessity. Under any circumstances we should hope you would be able to enter into any explanation.

**MARIETTA.**—You should endeavour to get plenty of outdoor exercise so as to cause greater activity of the bowels, and thus prevent all these unpleasant feelings that you get in the stomach. Avoid drinking too much tea or eating too much meat. Eat lean meat and boiled fish and fowl, and see that you take your meals quite regularly. Take also the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, spirit of peppermint one drachm, chloroform water to six ounces. One-sixth part three times a day between meals.

**GRATEFUL.**—1. I am indeed glad that you have taken what I felt bound to write in the spirit in which it was intended. You will see by other replies in these columns that the case is not solitary, though the circumstances are very various. I do not need to go through my former reply in detail, but I would remind you that corporal punishment of a lad over twelve or fourteen, even by a man, is calculated to transform him from a lad of spirit into an obedient coward. This is evidenced by the difficulty you had in getting the lad's subordination, and the subsequent cowardice displayed by him. Under the circumstances described in your former note, his spirit was broken, and he will unfortunately suffer throughout his life from the irreparable injury inflicted upon his morale by punishment at the hands of a girl. "Boxing the ears" at all is dangerous, however, and by whomsoever administered. The gloves and the small, soft hands aggravate the flogging. As for the discipline—let me tell you briefly, it is offence. That is not discipline—it is moral cruelty, as far as the lad is concerned. The case is aggravated by the permission accorded to your niece to participate in the tyranny practised at the expense of the victim. 2. You ask me for a remedy for this sad perversion of the sexual instinct on the part of your daughter and niece. Will institute on the part of your daughter and niece. Change of scene would be useless where the moral sense is unhinged, where the insidious beginnings of sexual vice have already held sway to such an extent that "they are in great distress" because you have forbidden them to punish the boys," and "when a young girl of beautiful beauty" is almost "excited herself" through not being permitted to be executed against a fellow inmate. This further evidence of perversion is unnecessary, but it is all the more conclusive. The remedy must be a full explanation by yourself to your daughter and niece of the harm both to the boys and themselves that must inevitably follow in the train of indulgence in unrestrained passion of that particular type. This lesson must be daily cold bath, and to dissipate, by fatiguing exercise, all tendencies in the wrong direction.

**LAND AGENT.**—We are glad to have so much evidence from various quarters that our quiet exposure of nefarious practices in schools is producing its effect in opening the eyes of parents and friends to the immense damage to body and soul that may be inflicted by them. We agree with you that cosmetics are entirely unnecessary for a child of fourteen, and "stays" are equally unnecessary and even harmful for a boy of the same age. But the suggestiveness of these habits is emphasised by the statement which follows, and the combination makes it clear that the daughter of the master is deliberately teaching these poor innocents' views from which, at least at school they should be protected. These practices will do serious harm, mental and bodily, to both the twins and to the others named, and you will fail in your duty to your nephew if you do not take immediate and unhesitating steps to put an end to them. We advise you with all the speed you may to acquaint the twins' guardian with the state of things, as well as at the same time to make known to the master of the school the horribly emasculating practices of which his daughter is the initiator.

**P. DOUGLAS.**—Shave the upper lip every evening. Immediately afterwards rub into the part with a sponge some of the following lotion: Blistering fluid four drachms, glycerine four drachms, rose water to six ounces.

**HOPFUL.**—1. We are sorry that at twenty-one and a half years of age there is not much chance of your growing another four inches, if at all. There is no method known to us, that you could be advised to employ with any prospect of success in that direction. By all means be careful of your diet, take a daily cold bath, and as much open air exercise as convenient, about of fatigue. 2. Clean the piano keys with sponge dipped in methylated spirit.

**BROTHERS.**—We sincerely sympathise with your difficulties and troubles, which are very difficult to relieve effectually. Soak the feet well at night and morning with hot water, in which a handful of borax has been dissolved. Each night after drying, paint with tincture of belladonna, and each morning use some boracic ointment instead of the tincture. Keep the bowels acting freely, and report to us in three weeks' time.

**MARY MACK.**—You will need external electrical treatment, properly applied under the direction of a qualified medical man. The case is not exactly an ordinary one, but it is not rare, and with care you should recover.

**LUX.**—The eruption has probably no connection with the risk run, unless you have some other symptoms which you have not described. In that case you had better see some specialist in the matter. Meanwhile the following mixture will be of service to you: Solution of potash (medicinal liq. potash) ten drops, sulphate of soda half a drachm, tincture of gentian half a drachm, chloroform water to half an ounce; to be taken three times a day between meals.

## EASTON'S SYRUP.

WHENEVER this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Plays Hymns, Popular Airs, Quadrilles, Waltzes, Hornpipes, &c. A mere child can play it. Cash or credit. Terms and List of tunes and full particulars free.

DRAPER, ORGANETTE WORKS, BLACKBURN.

**TANTON.**—This condition of the liver is unknown to pathology. It is supposed to indicate in either male or female diseased sexual instinct, termed respectively satyriasis and nymphomania. The diagnosis is dependent upon observation of the conduct and actions of the person concerned in relation to the opposite sex. The fact of a man having five wives does not prove him to be a satyriac. Accident or disease may be accountable for the deaths of some of the defunct partners.

**POOR READER.**—You had better take a cold bath every morning, having a good rub down afterwards. Get plenty of active outdoor exercise, and be careful to keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bed time, and followed the next morning by a mild dose of aperient fruit salts. This will prevent all the indigestion symptoms, especially if you have plain things to eat. With regard to the other matter, you must be very careful to avoid going to sleep on your back, as this is the main cause of your trouble. Take a teaspoonful of Parrish's Food three times a day, immediately after meals.

**HEADACHE.**—Yes. The vapour is very likely to cause headache in people of a certain constitution. Perhaps you do not get much out-door exercise. Take the following medicine each morning before rising: Sulphate of magnesia one drachm, nitrate of potash five grains, peppermint water to half an ounce. Drink no beer, and if you are a smoker, give up using the weed for the present.

**DROOPING ONE.**—The chances are that you require a change of air and environment. No man can have his nose always at the grindstone without recess. Unwanted and persistent depression is a common consequence of all work and no play. At present we should recommend you to take a teaspoonful of the ammoniated tincture of quinine three times a day in a wineglassful of water. Have your meals regularly, and keep the bowels freely open. Go on with the medicine for a time, and do not expect to feel any results under three or four days.

**CAREFUL.**—The description you give of your symptoms sounds very much as if you were suffering from varicose veins, though of that we cannot make sure until we have practically seen the thing for ourselves. A varicose vein is a bundle of enlarged veins, feeling like worms running into the scrotum; it is often very painful, and is quite likely to give rise to the feelings you describe, being also relieved by stool. You had better see some good doctor to make sure of it, and follow his advice on the matter.

**ANXIETY.**—1. This is a natural secretion; wash the part with soap and hot water every day, and dry thoroughly with a soft towel. 2. Do not sleep upon your back; rise to empty the bladder each time you wake. Keep the bowels acting freely; take a sufficiency of exercise, and no less sleepers. 3. Take the following mixture: Bicarbonate of soda twenty grains, bromide of potassium twenty grains, tincture of henbane half a drachm, water to half an ounce. To be taken night and morning for a month.

**ST. ANN'S.**—The pill may be taken on alternate nights for a fortnight. Miss a fortnight, and take the pill again as before. Do not take more than forty-eight in any single year. The saline may be taken as before, and provided the dose is not too strong, may be persisted in even when you are not taking the pills.

**A. B. C.**—Your history is not very clear. Treatment for two months, if the disease was really what you say, would not be sufficient. Two years' continuous treatment would be very much nearer the mark. However, you can do no harm by taking the following mixture three times daily before meals: Iodide of potassium five grains, spirits of chloroform five minims, decoction of sarsaparilla to half an ounce.

**POOR BLOOD.**—You had better take two of the bipalatinoids of carbonate of iron three times a day, with or immediately after meals. They may be obtained at any good chemist or of the manufacturers, Messrs. Oppenheimer, Son, & Co., 14, Worship Street, London, E.C.

**X. Y. Z.**—You have done wisely not to throw your money away on the worthless plan described in the paper. Your only treatment is that by operation. If you wish us to give you the name of a reliable surgeon, we will do so with pleasure.

**BANGOR, CO. DOWN.**—The gentleman you refer to has been struck off the register for advertising himself, so we should not recommend you to have anything to do with him, especially when there are so many good physicians whom you can go to see.

**Y. QUACKERY.**—We cannot answer the question involved in your pseudonym without knowing your general history and physical condition. You have failed to mention your age, occupation, habits, &c. It is possible that a course of electrical treatment would be beneficial to you, but that would be rather expensive, as the course would require to be protracted.

**A. FEMALE M.M.S.**—You do not say how you are affected. At any rate, we see no harm why you should continue to use the syringe as you have been accustomed to. We are very pleased to hear that the perusal of the pages of the FAMILY DOCTOR has been attended by such happy consequences to you. You have not mentioned your age nor habits, if potatoes are well-cooked and eaten in moderation they will not cause any constipation.

**BENDIGO.**—Your reply will have appeared in the issue preceding this. Read the heading to "Answers to Correspondents."

**LOND ON.**—You should endeavour to get a cold bath every morning, and to get plenty of active out-door exercise, as well as your proper mechanical work. Avoid beer, wine, or spirits for the present, and let your meals be of the lightest, and most assimilable character; they must also be taken at regular intervals. Avoid smoking for a day or two altogether, and take the following medicine three times a day: Sulphate of magnesia two drachms, carbonate of magnesia three drachms, spirit of peppermint one drachm, chloroform water to six ounces; one-sixth part three times a day between meals.

**A. M. C.**—This is a very common symptom of indigestion and is likely to be aggravated by your taking porridge. We should advise you to be very careful about the regularity of your bowels and about your diet. There is no reason why you should not eat fish, bacon, or eggs for breakfast, roast or boiled meats for dinner, and something the last thing at night, but you ought to take plenty of active outdoor exercise, and not sit at a machine or table all day long. Take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one and a half drachms, infusion of gentian to six ounces. One-sixth part three times a day immediately after meals.

**MARIAN GREY.**—We should advise you to go to one of the Orthopaedic Hospitals. There is one—The Royal Orthopaedic Hospital at 297, Oxford-street, W., and there is another in Portland-street. You should certainly not leave a stone unturned to get as much good as you can for yourself.

**A. R.**—You must have something other than "chapped hands" at this time of the year. However, you may see what the result of using the following ointment twice a day will be: Red oxide of mercury three grains, oxide of zinc one drachm, vaseline one ounce, pure carbolic acid ten grains. Wear white linen gloves at night, having well soaked the hands in the ointment.

**SNAPS.**—Wash your face and chest only in hot water, using good soap—sorbene or triaolia. Rub the parts thoroughly with a towel after drying, press the pimples out; at night after bathing with water as hot as can be borne. Take the following medicine before each meal: Dilute phosphoric acid ten minims, chloride of ammonium ten grains, tincture of gentian half a drachm, water to half an ounce.

**A. F. B.**—You are correct in your surmise as to the cause of the conditions both in yourself and the children, but you may be comforted by yourself with the knowledge that, particularly in the case of the children, the disease is quite amenable to control by proper specific treatment. Personally, you may take the following mixture: Iodide of potassium six grains, chlorate of potash six grains, glycerine twenty minims, tincture of bark half a drachm, water to half an ounce. Three times daily after meals. The children should be seen by a specialist, with yourself if possible. He will probably put them on the path to recovery without much difficulty, provided, of course, the disease has not been allowed to cause organic disintegration of any of the parts affected.

## WRITE TO-DAY

ESTABLISHED 50 YEARS.

# GILLINGWATER'S HAIR DYE

GIVES A PERFECTLY NATURAL APPEARANCE.

It is absolutely impossible to detect that the Hair has been dyed when Gillingwater's is used.

GILLINGWATER'S HAIR DYE, for use when the hair is Grey, turning Grey or Faded, also for changing Red Hair to a beautiful Black or Brown. Gillingwater's Hair Dye stands unrivalled by all similar preparations. The safety, reliability, and excellence of this Hair Dye has deservedly won for it a world-wide reputation extending over half a century.

ADVANTAGES.—Simple in application; never fails; does not stain the skin; one application only necessary; anyone may apply it; never disappoints.

CAUTION.—The great sale of GILLINGWATER'S HAIR DYE has induced competitors to substitute articles of their own manufacture. Purchasers should be careful never to buy a case of Dye that has been OPENED, and always OBSERVE every genuine case bears the Name—"GILLINGWATER AND CO."—to counterfeit which is FORGERY.

Strongly recommended in preference to all other Hair Dyes, by the eminent Dr. CHURCH, of the Royal Agricultural College. His Certificate accompanies every bottle.

Gillingwater's Dye lasts longest. Obtain Gillingwater's or write direct for it. Gillingwater's will send it, free by post, on receipt of Postal Order for the amount, the package bearing no indication of contents.

Sold, with fullest directions, to dye any desired shade of Brown or Black, in elegant cases, 3s. 6d., 7s. 6d., and 21s.

GILLINGWATER'S HAIR DEPILATORY most effectually and safely removes superfluous Hair from the Face, Neck, or Arms. Large Cases, 3s. 6d.

Write to Gillingwater & Co. Regent Works, Cross Rd., Hackney Downs, London  
POST FREE.—A little Pamphlet, "How to DYE THE HAIR."

## FOR PAMPHLETS—FREE.

"The FAMILY DOCTOR conveys to its readers much Useful Information."—The Graphic.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scuffs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

## EDITORIALS.

**HURRIED DINNERS.**—It is a mistake to eat quickly. Mastication performed in haste must be imperfect even with the best of teeth, and due admixture of the salivary secretion with the food cannot take place. When a crude mass of inadequately-crushed muscular fibre, or undivided solid material of any description, is thrown into the stomach, it acts as a mechanical irritant, and sets up a condition in the mucous membrane lining, that organ which greatly impedes, if it does not altogether prevent, the process of digestion. When the practice of eating quickly and filling the stomach with unprepared food is habitual, the digestive organ is rendered incapable of performing its proper functions. Either a much larger quantity of food than would be necessary under natural conditions is required or the system suffers from lack of nourishment. The matter may seem a small one, but it is not so. Just as a man may go on for years with defective teeth, imperfectly masticating his food, and wondering why he suffers from indigestion, so a man may habitually live under an infliction of hurried dinners, and endure the consequent loss of health, without knowing why he is not well, or how easily the cause of his illness might be remedied.

**NATURE'S CURES THE BEST.**—The best house-keeper to take entire charge of our tenement of clay is Mother Nature, and, like all other housekeepers, she is very partial to the virtue of cleanliness. Dr. Willard says, "Women make themselves portable machines for effete matter. Their nerves cry out when fed by dirty blood, and their cry is called neuralgia."

**BREATHE** clear air from morning to night and from night to morning again, and you will be rewarded with a lightness of spirit that the chemist is powerless to bestow. Eat clean food, food that is not greasy, nor spicy, nor hard of digestion, and you will be nourished and made strong by the only genuine blood purifier in the market. Bathe in clean water every day, and note the elevating and tranquillising effect

it has on the mind. Think clean thoughts, and the body as well as the soul will seem to be mate-fellow with the angels.

A PERSON suffering from quinsy sore throat will find relief by gargling with a strong solution of common soda dissolved in warm water.

**ON READING.**—Too much reading affects the intellectual nature very much as gorging or gormandising does the physical—overcharges it with food it cannot assimilate. We have known a man who, with respect to technical knowledge and the incidents of history, was a "walking cyclopaedia," but who, probably, never gave expression to a distinct idea of his own, or could have written an original dissertation on the simplest subject. The information he possessed had been packed into his cranium in very much the same manner that a dentist packs the gold foil into the cavities of his patients' teeth. Digest your knowledge as you acquire it, and you will have a good intellectual appetite and power of assimilation as long as you live. Sometime in your life, too, you may be accounted wise.

**CAUSE OF FOUL BREATH.**—Foul breath comes from several causes—viz., digestive disturbances, bad teeth, or certain forms of catarrh. If foul digestion, it comes from the stomach, and in that case the stomach should be washed out or otherwise sweetened, and a mild diet adopted until the stomach clears itself. If from the teeth, it usually comes from a cavity in which food lodges and decomposes. This is deleterious to health, aside from being very disagreeable, and should be remedied by consulting a good dentist. If from catarrh, it is usually the atropic kind, in which there is usually a good deal of dryness to the throat, the secretions become morbid and cling to the mucous membrane, decomposing and forming a crust, usually in the posterior nares, or vault of the pharynx. This is a very troublesome form of catarrh, and should lead to a consultation with a specialist. A spray of peroxide of hydrogen mixed with water, equal portions, will destroy all odours. We have also found an application of carbolised vaseline to be of great service.

**DILATED STOMACH.**—A dilated stomach is usually the result of a relaxation of the stomach and the system in general, and is usually brought on by over-eating. When we remember that the stomach is simply a hollow muscle, and that when muscles from lack of tone relax, it gives rise to a considerable lassitude, we can very readily see that, the stomach being a hollow muscle, such relaxation of the whole circumference of the stomach would admit of considerable dilation; and when thus dilated, its action is impaired, the secretions impaired, and a slow digestion must be expected. As to its cure, in few words, avoid taking large quantities of fluids, make the diet as nutritive and concentrated as possible, massage and rub the stomach, take electrical treatment, and exercise good care. With care, dilated stomachs will in great measure recover.

**LONG LIFE IN BUTTERMILK AND ONIONS.**—"Drink plenty of buttermilk and eat lots of onions—raw, stewed, or boiled, not fried," says a noted medical authority, "and you may live to such an age that you may be glad to commit the suicide act, just for a change."

**EATING BEFORE SLEEPING.**—The idea that eating just before retiring is conducive to good sleep is a great mistake. One cannot digest food and sleep well at the same time. He should go to bed with an empty stomach. If your stomach "gnaws so that you cannot sleep," it is because your stomach is in such a weakened state that the grinding of the walls together produces irritation. You should give it a chance to rest, and not keep loading it up every time it tells you it is tired out. The practice

of eating just before retiring is almost a certain means of producing bad dreams, and sometimes nightmare in adults, or "terrors" in children.

At some of the inebriate asylums oranges have proved an efficient substitute for alcohol, patients sucking the juice of them abundantly every time the thirst for liquor comes upon them.

**HOT WATER DRINKING.**—There are four classes of persons who should not drink large quantities of hot water. These are as follows:—1. People who have irritability of the heart. Hot water will cause palpitation of the heart in such cases. 2. Persons with dilated stomachs. 3. Persons afflicted with "sour stomach." 4. Persons who have soreness of the stomach, or pain induced by light pressure. These rules are not for those who take hot water simply to relieve thirst, but as a means of washing out the stomach. Hot water will relieve thirst better than cold water, and for that purpose is not to be condemned. But hot water is an excitant, and, in cases in which irritation of the stomach exists, should be avoided.

**THE ORIGIN OF PETROLEUM.**—Petroleum, which is popularly supposed to be derived from coal, is, according to advanced science, more probably the result of the action of water on metal.

**DR. GALIPPE** reports to the French Academy of Sciences, after eight years' investigation, that all stones, such as gravel, found in the human body are produced by microbes. Microbes are the authors of that chemical decomposition which results in calcareous deposits.

**TOAST.**—We toast bread not merely to brown it, but to take out all the moisture possible, that it may be more perfectly moistened with the saliva and thus easily digested; then we brown it to give it a better flavour. If the slice be thick and carelessly exposed to a blazing fire, the outside is blackened and made into charcoal before the heat can reach the inside. The moisture is only heated, not evaporated, and makes the inside doughy or clammy; and butter when spread upon the bread cannot penetrate it, but floats on the surface in the form of oil, and the result is one of the most indigestible compounds. The correct way is to have the bread stale and cut into thin, uniform slices and dry it thoroughly before browning it. Such toast, moistened with water or milk, may be easily and thoroughly acted upon by the digestive fluids.

The primeval enjoyment of man is the most healthful of all occupations; healthful for the body and the soul. The husbandman walks forth under the open sky, his broad acres spreading beneath his feet; the blue concave, sunlit or starlit, or shrouded in clouds, is still above him. Health claims him as her favourite child, and the glorious sun loves to kiss a cheek that is not ashamed to wear the ruddy imprint of such affection. Nature's own inimitable babbling brooks, birds, breeze, or rustling foliage enter his ear on their glad mission to his heart. He listens to instructive voices continually speaking from the universe around him. His eyes gather truth from pages of wisdom, everywhere open before him. Each day, each month, season after season, year after year, these teachings are given to him, infinite in variety and endless in extent. When, towards the close of a sultry day, the summer's blessing comes pouring down, as says the beautiful poetry of the sacred volume, the trees of the field clap their hands, and the valleys, covered with corn, shout for joy; the husbandman retiring from his labours to the friendly shelter of his cottage roof, improves his leisure hours with measures of wisdom.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

"The FAMILY DOCTOR contains useful Hints on Medical Subjects."—*Sunday Times.*

[SPECIAL ARTICLE.]

## THE HUMAN HAND.

By "H., M.D."

(See Frontispiece.)

THIS instrument of the mind is fashioned in a marvellous manner; its internal anatomy reveals a network of nerves and blood-vessels, a branch of both to each of the fingers back and front, and two supporting arches of the bloodvessels—one superficial crossing the palm about the level of the cleft between the thumb and forefinger, the other situated deeply about an inch nearer the wrist. The arches of the palmar vessels are sometimes cut, and bleeding from them is very difficult to stop, but firm pressure generally suffices; in the case of the deep arch the services of a surgeon may be requisite. The muscles are of two kinds—those running down from the forearm, which are chiefly concerned in opening and closing the hand, and the muscles of the hand proper, which do the more delicate work, such as opposing the thumb, separating the fingers, and in the flexor movements of writing. The fingers are encased in, first, the skin; next, the superficial fascia; and then the deep fascia, with the tendons or leaders running beneath each layer of fascia. In the very painful affection called whitlow, matter or pus is formed beneath one of these layers of fascia, and, in consequence of being so tightly bound down, the pain is very great; the sooner the pus is let out by a surgeon the better. Poulticing means that by hot applications you are simply hastening the softening process which goes on in the inflamed tissues, and that you are practically waiting until the pus rots its way through fascia and skin, consequently the healing process is longer, and the mischief done is greater, and many fingers have to be amputated when by means of nitrous oxide gas (the same that dentists use) the necessary incision could have been done in thirty seconds, and quite painlessly. These layers of fascia explain also how it is that inflammation of the hand so quickly spreads up the forearm, along the sheaths of the tendons.

Why the fingers differ in length it would be difficult to explain satisfactorily, but no doubt it is the outcome of the all-important law of evolution. In the horse the middle finger only persists; in the monkey, whose hand is very similar in structure to that of man, the only difference is the power of opposing the thumb, so that the animal grasps a stick by means of all five fingers on one side. But enough for the present of the anatomy, comparative or human, we are most concerned with the uses of this member of our bodies.

The hand from the nature of its occupations is very liable to accidents of all kinds from a simple crushed finger to the frightful machinery accidents that constantly occur in all our great works. Fig. 3, gives the result of one of the commonest, in which the writer had to fashion a stump, the patient having chopped off with an axe the thumb a little below the second joint. It is very necessary to leave a proper stump in these operations, one that will be useful, not as is frequently seen, a member that gets in the way at every movement. The position of the tendons and their insertions and the muscles must be carefully considered. In fig. 3 the thumb stump can be opposed, and it enables the man still to follow the laborious occupation of a striker in a foundry—he is able to grasp the handle of his hammer. Figs. 1 and 2 are from the same hand, and illustrate a useful member. This injury was the result of a circular saw accident, and nothing was done beyond the insertion of a few stitches and dressing. Fig. 2 shows the manner in which the man is able to grasp the handle of a brush or a stick; but, as the patient is a painter, and the hand is the left, he does not require to use it much. Still it is given as an illustration of the possibilities of conservative surgery.

From the use of some tools the hands become affected. One of these is caused by constant pressure on the palm, as in shoemakers using an awl, and results in a permanent contraction of some of the fingers, the digits being drawn and contracted into the palm and immovable—this affection, which goes by the name of

"Dupuytren's" contraction, is cured by dividing the underlying fascia.

The hand is the instrument of the mind, but it is not an organ of mind.

"Palmistry" is a below-stairs delusion. Like many such things it has a very small basis of truth; for instance, we are told it is *unlucky to spill salt*. So it is, in the sense that it is waste, and waste must, or rather frequently does, bring misfortune, which in many persons minds is confounded with luck. Salt in many countries is a very precious and expensive necessity, and the application of the proverb is more evident than in ours. But, to revert to "Palmistry," the lines of the hand are those that mark the folds, and are undoubtedly made more prominent in different positions by different occupations, but there the truth ends. The most constant lines are three—one commencing at the junction of the fore and middle digits, and running in a concave sweep inwards to the inner border about an inch below the base of the little finger; the next commences at the metacarpal-phalangeal joint of the index finger, and runs with a convex sweep towards the middle of the inner eminence of the palm; and the last commences between the centre of the palm next to the wrist, and runs upwards and outwards to join the second. These three are fairly constant in all persons, but even these depend on such a variety of circumstances that there are only general deductions to be drawn from them, and not, as certain interested persons would have their dupes believe them to be, an index of the mind.

The most differentiated common use of the hand is as a medium to express the thoughts, as in writing, painting, &c. In the first of these—writing—the muscles of the shoulders do the side to side movement across the page, and the lumbricales, small muscles of the palm, makes the actual strokes of the pen. Writing varies to a great extent, and to a large extent in habitual writers is mechanical automatic action in so far as the actual formation of the letters is concerned; but, in beginners and persons whose associations do not necessitate their writing so often as to keep in practice, they have to think over the formation of the letters, and studiously form them—hence the writing is usually cramped and large.

Handwriting, it must be admitted, is thus apt to reveal, being automatic and so far under the influence of the mind, an idea of the mind's state; but this is only a general truth, because the mind can exercise, even in the most violent torrent of passion, an indefinite amount of control over the movements of the pen.

Two *fac-simile* illustrations are given of the handwriting of Napoleon Bonaparte, the greatest general France ever had. Both are almost unreadable, and both, perhaps, show the impetuosity of the mind. If you wish to learn what truth there is in deductions from handwriting of the person's character, examine for yourself the splendid series of specimens of writing now lodged at the British Museum in the Prints Department, and then consult the biography of the writer of the specimens you choose, and most of them you will find belie the character of the individual as recorded.

These short notes on the human hand, then, have mostly been directed to the object the FAMILY DOCTOR ever has in view—to make its readers think, and help them to a just conclusion and estimate of the cobwebs spun by ignorant persons, or, perhaps, not so much ignorant as knavish, whose endeavours are mostly directed to lighten the pockets of their victims, when attracted by the alluring names of "Palmistry," "Chirography," &c. Again, the writer would insist that a few minutes thought will convince any person that the hand is no part of the human mind, only a humble, though important, instrument, and its movements are in writing two fold—voluntary and involuntary; and the lines on the palm are dependant on so many things—the thickness and moisture of the skin, &c., that no conclusions can be drawn that are of the slightest use in studying character.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

## POWER OF THE IMAGINATION.

AN unfortunate asthmatic, compelled to make a hurried journey from home, arrived very late at night at a country inn; where he had never put up before. Completely worn out, he partook of supper and was then shown into a huge, old-fashioned bedroom, the further portion of which was only dimly illuminated by a miserable candle. He was not long in throwing off his clothes, extinguishing the candle and slipping into bed. The feeling of being in a strange place and the rapid mental review of many incidents of his day's journey, with the closeness of the heat, combined with the late supper, brought on a wakeful, nervous condition which induced an attack of asthma. Gasping for breath, he scarcely knew what to do; to get up and grope about such a large room in quest of a door or window by which he could admit more air seemed beyond his powers. All at once he remembered that somewhere at the far end of the room he had noticed, while undressing, a reflection as from glass. This he promptly concluded must have been the window, and, seizing a stick which he had placed on a chair by the bedside, he hurled it through the gloom. His conjectures were confirmed to his satisfaction, for the clattering on the floor of the pieces of broken glass showed him that he had not only guessed as to the position of the window, but had also succeeded in smashing one of the panes. In his imagination the air of the room became cooler and fresher, and the paroxysm of difficult breathing soon ceased, the result being that he fell into a refreshing slumber which lasted till morning. Upon his awaking he was surprised to find the daylight streaming into the room from a direction exactly opposite to that in which, overnight, he imagined the window to be situated. Turning to glance down the room, he discovered he had smashed a quantity of glass, surely enough, but it had formed no part of the window, as he supposed, but the front of a glazed bookcase.

## UNDUE CORPULENCY.

HOW IT CAN BE REDUCED BY PROPER DIET AND EXERCISE.

THERE are two kinds of women in this world who are morbidly unhappy from what they choose to regard as Nature's injustice to them. These two specimens are those who are either extremely thin, or who are burdened with an excess of flesh. The former, however, though it may be treason to expose their little frauds, may help Nature out by sundry pads and a fluffy style of dressing, but the stout woman, despite all her efforts to hide her undue corpulence, is conscious always that her flesh is unwieldy. But to such as these there is only one method of actual reduction, and that is by a combination of diet and exercise. There is danger in an abnormal increase of size, as it brings other troubles in its train, the more serious of which are accumulations of fat around the heart and lungs. Mild aperients should be taken frequently, also stewed fruits. All alkalines are valuable, and lemon juice is desirable in every form. Green salads, watercress, and asparagus may be taken freely, but potatoes and all farinaceous food should be strictly avoided. The mistake should not be made of taking vinegar, save in moderation, and with other articles of food, for in large doses it will produce inflammation of the inner coats of the stomach.

To produce a gradual and lasting reduction in size, diet is of the greatest importance, and with this and mild aperients an unhealthy increase of adipose tissue may be prevented. To the stout woman exercise is generally a burden, but begun in small doses and increased gradually it will soon grow to be a pleasure and a benefit as well, if she is really determined to reduce her size.

TIGHT LACERS.—Ladies and Gentlemen's Corsets Fitted Personal visit not necessary. Self-measurement form free by post. Satisfaction guaranteed. Best qualities. Lowest prices. Give fits for Professionals. Neatness, comfort, health. FORD AND PARR, 141, Stockwell Road, London, S.W. Estab. 1856.

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch*.

## THE PLUMBER.

THE Lord Mayor of London has been making a kind of royal progress throughout the north of Scotland, which is the home of his maternal forefathers. The immediate occasion of the journey seems to have been his desire to be present, in his capacity as Master of the Worshipful Company of Plumbers, at the National Congress, appointed to be held this year at Aberdeen. At a banquet given to him in that city by the Corporation on August 30th the chairman, the Lord Provost, said that he supposed there had been no progress like that which his lordship had been making over Aberdeen and the Highlands since the Duke of Cumberland invaded the northern part of the kingdom; and there can be no doubt that the presence of the Lord Mayor has given great *éclat* to the Congress of Plumbers in Aberdeen. This is not the first time that Sir Stuart Knill has shown the lively interest he takes in the Guild of which he is Master during the present year. At the banquet referred to the Lord Provost of Dundee spoke warmly of the help they had received in that city from the presence of the Lord Mayor at the Plumbers' Congress last year, of the admirable address which he gave on that occasion, and of the influence which he exercised, as giving special importance and value to the proceedings; and Aberdeen will doubtless profit as much as Dundee did a year ago.

Sandringham has been, in a sense, the making of the plumber. The saying is attributed to Sydney Smith that the railway people would never be got to make reasonable arrangements for the safety of their passengers until they had a director or two killed in an accident. And very likely we should have gone on grumbling occasionally at the obstructions caused, or permitted, by our friends, the plumbers, but doing nothing, if it had not been that the nation was at last aroused when it was realised, some twenty years ago, that we had nearly lost the heir to the crown through defective plumbing arrangements. It is an ill wind that blows nobody good. Last autumn's cholera epidemic at Hamburg will no doubt prove to have been a blessing in disguise—just as the Plague and the Fire combined inaugurated a new hygienic era for our own metropolis. And there can be little doubt that the threatened calamity at Sandringham gave an immense impetus of the most valuable kind to a movement in the direction of making improvements in the art of plumbing. The public interest in the craft may safely be dated from the time when the Prince of Wales just escaped with his life from an attack of typhoid fever; and since then that interest has been growing from year to year, and it culminates in the Aberdeen meeting of the present autumn.

It is not at all needful for us to attempt to justify this interest, or even to explain it. It must be sufficiently obvious that the health of the public is, to a very large extent, entrusted to the care of the plumber, and that we are compelled, therefore, to concern ourselves about his efficiency and his honesty. There are few professions or trades in which more reliance must be placed on the honour of those who are engaged in them; for, from the very nature of the case, the plumber's work is for the most part entirely unseen, and it might easily be scamped without anybody being a bit the wiser—at least, for an indefinite time. A very grave responsibility rests, therefore, upon those who have made this profession the work of their life, because the public must rely so implicitly on their doing their duty in a conscientious way. Conscience cannot, of course, be imparted to those who do not possess it, and it is not a matter with which any legislation can meddle. But public opinion and the *esprit de corps* and feeling of honour that grow into a tradition among the members of a particular craft have the effect of creating a conscience which sufficiently serves as a practical instrument in matters of business. And the more that the plumbers feel that the public are relying upon their honour, the more honestly, and, therefore, the more effectively, will they do their work.

But it is not enough that your plumber shall

be an honest man; you desiderate also that he shall be a skilled and efficient workman. Dean Ramsey tells a story of a lady of the old school who was in need of a cook. Some friend recommended a person who it was hoped might prove suitable, and who, at all events, the friend, was a pious woman “——her piety!” said the profane, old Scottish gentlewoman; “can she cook a beefsteak?” And the plumber's honesty, however superlative it may be, will not make up for the want of professional skill. That the means for his obtaining this might be put within his reach has been the main object of those Congresses, held in recent years, intended to promote the interests of the craft. Their more immediate aim has been to secure legislative sanction for the official registration of plumbers, and so to elevate the entire status of the trade. That has been the constant effort of the various District Councils in recent years, and if the co-operation of the municipal authorities throughout the country can be obtained, there can be little doubt that the object aim at will be speedily realised. When lord mayors, not to speak of lord provosts, begin to take interest in a movement, and in a manner to identify themselves with it, even the least sanguine may cherish the hope that the desired result cannot be very far off.

Registration is, of course, only a means to an end—the end being a guarantee to the public that the important work which plumbers undertake shall be efficiently done. The object of a Bill which is again to be brought into the House of Commons is to secure, therefore, that power shall be obtained to exercise discipline over those who may be registered, and to remove, if need be, from the registered list the name of any man who might be found doing defective work. In the interests of the trade it would be desirable that the Act that is sought to be obtained should be sufficiently stringent; for the man who scamps his work is not only deceiving and injuring the public, but he is also doing a serious injury to his fellow-craftsmen. The effect of registration would be that only thoroughly competent and qualified men would be permitted to carry on the business of a plumber, and while provision would be made for testing, by examination, both on the theory and on the practice, the qualifications of those who might seek to be placed on the registered list, it could easily be arranged that men who had been a sufficient number of years at the trade should obtain registration without examination on giving satisfactory evidence of their qualifications. It does not admit of question that a measure of the kind indicated would exercise a decided and immediate influence in the elevation of the plumber trade to the position which it deserves to occupy.

But as registration contemplates examination, so this, again, implies education. The plumber ought to be a thoroughly trained and fully-equipped tradesman. To secure this end it is needful that he should have the opportunity of learning his trade, not only by rule of thumb, but in accordance with the scientific knowledge of it that has been acquired in recent years. And this means that the student should be able to attend classes in which he could receive a systematic course of instruction in the principles that underlie plumbing, as well as in the technology and practice of his trade. The provision of such scientific and technical education is, however, an exceptionally costly affair; and one of the objects of such a congress as that which has just been held in Aberdeen is to urge upon municipalities and county councils the necessity of supporting a movement which is certain, if efficiently carried out, to render essential service in the direction of contributing to and preserving the public health. It is a vast army that is now engaged in the battle against dirt, disease, and death—an army that includes men of science in their laboratories, practising physicians in families, medical officers of health in their district, sanitary officers, architects, builders, engineers; and not the least valuable department of the service is that which is occupied by the plumber.—*Sanitary Record*.

TO TOBACCONISTS (commencing).—Illustr. Guide, 259 pages. Post Free. How to Commence, £20 to £1000. Tobacconist's Outfitting Co., 186, Euston Rd., London. Manager, Hy Myers. Est. 1868. Smoke “Pick-Me-Up Cigarettes.”

## A GLIMPSE AT A LOCAL PRISON.

FURNISHED with our credentials, says a writer in a recent number of the *Pall Mall Gazette*, we found ourselves for the first time in our lives shut off from freedom by the massive iron-bound gateway of one of Her Majesty's “local prisons.” The head warder, a most courteous and business-like functionary, received us graciously in the lofty central hall of the building, from which there radiated long corridors flanked on either side by a row of cells.

“This is my vantage ground,” explained our conductor with a smile, as he pointed to a raised desk in the centre of the great hall. “From this place I get a view of everything which is going on within the prison outside of the cells.”

We were much struck by the extreme cleanliness and abundance of air and light within the building. The former were easily accounted for, several men in prison garb being at the time engaged with soap and water washing down the tiled corridors, and a faint refreshing odour of disinfectants made itself noticeable.

“We put the long-timers on this kind of work,” remarked our warder. “They are generally men who have been well-behaved in prison, and who have performed their ordinary ‘labour’ satisfactorily.”

“What do the ordinary prisoners get in the way of hard labour?”

“Well, it differs somewhat in different prisons. Here, at W——, they have a month on the treadmill. We devote the second to oakum-picking in their cells. Afterwards they go into the wood-cutting sheds. But you shall see them at work for yourselves.”

We had strolled down one of the corridors and were standing before a large iron grating. This being withdrawn, we were admitted into the apartment where the treadmill found its devotees. “Would you care to try it, sir?” inquired the warder in charge. Accepting his invitation, I mounted a vacant “stand” and applied myself assiduously to a few minutes’ “hard.” The work was not difficult, but when it is remembered that six hours is the allotted daily task, and that the prisoners work with only ten minutes’ rest in each hour, it must be considered sufficiently tedious. At all events a brief five minutes satisfied my own curiosity and I dismounted, when to my astonishment the whole machinery stopped. Noticing my look of surprise our conductor graciously offered an explanation.

“You see, sir, every man is bound to lift his own weight by our system. Once the men are at the stands the machine is regulated to their united weights, and if a man steps off even for a moment the whole machinery is stopped, and we detect him at once.”

“Do they often give you trouble?” I inquired.

“Very rarely indeed. Occasionally, of course, we get an awkward customer, especially among the women, but as a rule the men are well-behaved. We had a man last year who persisted in breaking the ‘silence’ rule, and after warning him the governor ordered him to be birched for the next offence; that dose quite cured him, and although he has been here two or three times since he has never given us any trouble.”

“Then the birch is useful as a corrective?” I suggested.

“Undoubtedly, sir. They don't like it; and I quite agree with the governor that it has a very good effect,” he added, with a touch of the importance of a dignitary.

“Do you use any other method of punishment? For instance, do you still use the dark cell?”

“We never use the dark cell now. Nor do we use anklets, or any such of the punishments in vogue in former days. We limit ourselves to dietary, solitary confinement, and corporal punishment. We are allowed to use the “cat” if absolutely necessary.”

On leaving the treadmill and its victims, we returned along the corridor and entered a vacant cell, the inmate of which was engaged elsewhere. This, as everything else in the prison, was scrupulously clean, well-lighted, and ventilated.

“We make the prisoners earn their luxuries

“The FAMILY DOCTOR is Carefully Edited and meets a want that has been long felt.”—*News of the World*.

by good conduct," our guide remarked. "When a man comes in he has no bedding except a pillow and this plank to sleep upon. After a month, if he has earned the requisite number of marks, he is allowed bedding and an improved scale of dietary, in addition to the use of books from the prison library."

"What exercise do you allow them?"

"Well, in the first month they get sufficient on the treadmill," replied our conductor with a smile. "After that, when they are engaged on oakum-picking, they are allowed an hour a day in the prison-yard—of course under supervision. You will notice," he continued, "our arrangements in the cells. This gas bracket is lit in the winter at dusk and turned out at eight p.m. This is an old cell, and you notice the brackets are inside—although sufficiently near the ground to prevent suicide. In the more modern cells they are enclosed in a cage in the hollow of the walls."

"Then I suppose eight p.m. is the hour for retiring for the night?"

"Yes, at that hour all the year round a warder inspects every cell through the spy-hole in the door, and thus makes sure that every prisoner is in bed. To further ensure good order he goes his rounds in list slippers."

"And in case of illness or other emergencies?"

"We provide them with a communication bell. You will see our ingenious contrivance," he added as he conducted us outside the cell. "When the bell is rung within, this disc is shown on the wall; and thus we see at once who has roused the warder on duty, for the prisoner cannot replace the indicator in position from within."

Having examined the rules and regulations of the prison, which were set forth at length upon a card suspended from the wall for the prisoner's edification, we then visited the reception-room into which each prisoner is ushered on first entering the prison. We found great presses filled with clothing and boots, and similar presses duly labelled which contained the everyday garb of the prisoners when in a state of freedom.

"Every man on entering is supplied with the prison clothing, which he is bound to wear. His own is sent to the laundry, which is worked by the female prisoners, and when clean is returned here and placed on yonder shelves to await his departure."

"You take great care of their personal cleanliness, I perceive?"

"Certainly we do. I can assure you that their personal condition very often improves considerably. They are bathed in the disinfecting baths you see before you when they first enter, and subsequently receive a bath every week, whether they like it or not—and some of them take to it in a by no means kindly spirit."

"Do you find they increase in weight?" I asked, remembering some recent newspaper remarks upon the subject.

"Sometimes. You see we weigh them directly they come out of their bath, and subsequently every month during their time. We find that tramps and such-like poorly-nourished people increase several pounds in weight as a rule, while those who are used to more luxurious living generally show a slight falling off."

"And what is the kind of food supplied to the prisoners?"

"That, too, you shall see for yourself," said our guide, as he conducted us down a flight of steps into the kitchens, which, for cleanliness and good order would have done credit to any large hotel.

The prison cook hastened to receive us and do the honours of his department, first showing us specimens of the food which had that day been supplied for the mid-day meal. We tasted the excellent meat soup and the wholemeal bread, which had been supplied, together with a liberal allowance of the most floury of potatoes, and "mentally made a note" of the fact that if one were "hard up" there would be many a worse dinner than that procurable within prison walls. Having been shown the various culinary arrangements, including a large steaming-oven for potatoes, which was evidently a source of pride to the cook, we were then conducted to the wood-cutting sheds. There we found some twenty men at work under the supervision of a warder. A circular

saw was being worked by hand; and while some were engaged in cutting, others were collecting or binding the wood into bundles ready for domestic use. We were much struck by the personal appearance of the prisoners, and with one especially—a handsome youth of some twenty summers. We made a remark upon the subject to our guide.

"That lad, sir," he said, "is one of the most hardened fellows we have got. He has been committed ten times already, and is quite callous as to anything done for his reformation!"

"He certainly has not a criminal appearance," I observed.

"No, sir, and you will find that the majority of those within the prison are not those you would have selected as types of the criminal class, if you met them outside." A remark which was perfectly correct, for on leaving the prison we were quite involuntarily struck by the marked superiority which many within showed to a large proportion of those whom we casually encountered on our way to the railway station.

"Do you make a profit on the results of prisoners' work?" was my next question.—"The wood-cutting pays its way; so, too, did oakum-picking until just lately, but at present the market is over-stocked, and we cannot get rid of our surplus." And he indicated several large bundles of fibre which were stacked in a shed close by.

"To what use do you put the treadmill?"—

"That, sir, is the only unsatisfactory part of our system. We make use of the labour for pumping the water required for the prison; but as that is accomplished in about two hours, or even less, the subsequent labour is waste, and we have to apply the lever system I showed you just now to ensure a standard amount of work being done. No doubt before long some new plan will be hit upon for utilising all labour."

"And do the prisoners earn anything by their work?"—"It is possible for them to get some eight shillings by the time they leave. In urgent and deserving cases the Governor is empowered by the Prisoners' Aid Society to spend five shillings more in buying second-hand clothes for them, or even in supplying them with funds or tools wherewith to start afresh."

As we left the yard we noticed a lad engaged in window-cleaning.

"One of the better-behaved prisoners, I suppose?"—"Yes, he is one of the most trustworthy." And then observing a prisoner standing close to him, our friend remarked with amusing candour: "Not that any of them are trustworthy yet, but we must hope for the future." Which remark we hope was duly taken to heart.

Our next visit was to the library, which was small, but stocked with carefully-selected volumes of various kinds—travels, standard fiction, and educational works predominating. Then we were conducted to the chapel, a neat, cheery little building where divine service is conducted daily by an enthusiastic young chaplain.

"A great favourite with the prisoners, sir," remarked our guide. "He seems to have hopes for everybody, even the most hardened. But you see, sir, he is a young man," he added in an apologetic undertone. And truly any but those with the enthusiasm of youth might well despair of some cases which come under a prison chaplain's supervision.

"Are they compelled to attend these services?"—"By no means, sir. Nor are they compelled to see the chaplain, though, as a rule, they prefer it, if only as a relaxation. They are asked their 'religious belief' when they enter, and it is noted on the description card affixed to the cell door, and unless they belong to the Church of England, the chaplain does not intrude without their express wish—which, by the way, is nearly always made."

"Is it your opinion from observation that crime is decreasing?"—"Most undoubtedly, especially in the rural districts. The manufacturing towns and the eastern counties are the most unsatisfactory in the way of improvement, the former possibly because the dregs of the country are continually drifting towards them. Our prison will hold one hundred and twenty men, and at one time, some ten years

ago, we were generally full, but for the last year or so our average has never been more than eighty."

"What are your numbers at the present time?"—"Just now they are rather below our average," he remarked, turning to his books of reference. "There is work to be had, and consequently less temptation to crime. We have seventy men in at the present time, I notice, and two women."

"Two women! Thirty-five to one—is that the usual proportion?"—"Not exactly, sir," he observed, laughing. "A more correct proportion would be one in six, but just lately the women of this district seem to be particularly well-behaved."

"I suppose some queer characters even prefer the life in prison?"—"Yes, strange though it may seem, they do. There is one old man who comes here regular every winter. He says the temperature of the cells is just suited to him, and the fare better than he can get outside, so he does his best to winter in this place, and generally succeeds pretty well."

We were then ushered into the prison yard, and having noted the grim instrument of the law's vengeance, which was taken to pieces and placed in a shed near at hand, we were conducted once more into the waiting-room. Thence, having signed our names in the visitors' book and inspected the photographs of prisoners, and a neat contrivance of mirrors by which a full face and profile are secured at one sitting, we took our departure, with many thanks to our guide for his courtesy and information.

**NATIONAL LIFE SAVING COMPETITION.**—In order to make known more fully the aims and objects of the Society, and to encourage the teaching of practical rescue work in schools swimming clubs, and similar institutions, the Society last year organised a National Life-Saving Competition, open to teams (of four persons in each team) in England, Scotland, and Ireland, and the Channel Islands. The teams entering are divided into districts and subdivided into divisions, not fewer than four teams forming a division. The names of each team in each division are then placed in one lot, and drawn in couples at the time. The two teams thus drawn compete against each other, the first drawn has choice of venue. As soon as the divisional competitions are finished the winners are drawn in lots in their respective districts, and the district winners compete against each other until two teams are left in for the final struggle, which this year took place on the 30th September, at the Excelsior Baths, Mansford-street, Bethnal Green-road. The prizes in this important event consisted of a Challenge Shield, value fifty guineas, presented to the Society by Messrs. Lever Bros., Limited, as a perpetual trophy, and in addition they provided four gold, four silver, and eight bronze medals for the winning teams in the penultimate and final ties. The total value of prizes given for this event amounted to £80. Last year twenty-four teams from various parts of the country entered, and, as each team numbered four persons, ninety-six individuals competed, which was a best on record in team competitions; but this year the result has been still more satisfactory, as thirty-two teams have been competing in the divisional and district rounds, which have been held in England and Scotland with great success.

## RECENT PATENTS.

*This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.*

17,316. Improvements in or relating to "Clover's" inhaler. E. C. RYALL, London. September 14th, 1893.  
17,376. An improvement in surgical wound books or retractors. A. W. DOWN and H. N. DOWN, London. September 15th, 1893.

17,383. Improvements in garments for invalids. E. E. L. LAKIN, London. September 15th, 1893.

## SPECIFICATIONS PUBLISHED.

15,578. DONISTHORPE, R.S., & E.N.B. Surgical dresses, bandages, &c. 1892. 10d.

BIRDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

"The FAMILY DOCTOR a Practical Household Periodical, useful and interesting."—*Globe*.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**TAPIOCA PUDDING WITH MILK.**—To two quarts of new milk add a teacupful of tapioca; soak over night, or put on back of stove in the morning, and simmer as when water is used. When soft, add a teacupful of sugar; bake an hour. Lemon or other flavouring can be added if desired. Made in this way it is much more delicate than when eggs are used, also more healthful, and much nicer.

**DELICIOUS MACAROONS.**—Beat the white of one egg very stiff. Add to it three scant ounces of pulverised sugar. Take three ounces of any kind of nut kernels. Mash them very fine, and add to the mixture. Drop from a teaspoon upon buttered tins. Bake a delicate brown.

**SAVORY BREAKFAST SANDWICH.**—Pound together to a smooth paste one part of fresh butter and two parts of grated Parmesan or thinly-sliced Cheshire cheese, and made mustard to taste; butter thin slices of bread with this mixture, and lay on half of their number a thin slice of ham, smoked beef, ox tongue, or any other cured meat. Press the rest of the cheese, spread bread on the above. Cut them into neat little sandwiches, and serve on a bed of mustard and cress.

**LYONNAISE POTATOES.**—Cut cold boiled potato into little dice-shaped pieces, add minced onion, fry in butter, season with salt and pepper, sprinkle with chopped parsley, and you will have Lyonnaise potatoes.

**BACON AND SWEET POTATOES.**—Fry as many thin rashers of breakfast bacon as are required, lay on a hot dish, and fry thick slices of cold boiled sweet potatoes in the fat; brown on both sides, heap in the middle of a dish, and lay the bacon around.

**GINGERBREAD.**—Half-cup of granulated sugar, mixed to a cream, one egg, half a cup molasses, half a cup of sour cream, in which dissolve a teaspoonful of soda, one teaspoonful of ginger, and one and threequarter cups of flour. Bake in a moderate oven to begin with. This makes one loaf, or can be baked in round patty pans. To make this successfully, use tin measuring cup.

**JELLIED CHICKEN.**—Boil the fowl until it will slip easily from the bones. Let the water be reduced to about one pint in boiling. Pick the meat from the bones in good-sized pieces, taking out all the gristle, fat, and bones; place in a wet mould; skim the fat from the liquor, add a little butter, pepper and salt to taste, and half an ounce of gelatine. When this dissolves, pour it hot over the chicken. The liquor must be seasoned pretty high, for the chicken absorbs.

**SAVOURY VEAL PIE.**—Cut veal small; stew till nearly done. Boil down gravy, season veal, put layer in dish, then layer of minced boiled ham. Make forcemeat balls of minced veal, of sausage and bread-crumbs, seasoning to taste, mixing to paste with butter; add yolk of one egg, make in balls, and dot ham with them. Cover meat with gravy made into brown sauce. Cover with gashed puff paste, and bake. Use mushrooms or sweetbreads for ham, if preferred.

**PEACH SHORTCAKE.**—Into a quart of flour put two teaspoonfuls of baking powder and one teaspoonful of salt, then sift. Into the flour rub with the hands two rounded tablespoonfuls of butter, then with sweet milk form a soft dough. Divide the dough into equal parts, roll one half lightly, to cover the bottom of a baking tin, rub the top over with melted butter, roll the other half and place it over this. While these layers are baking, peel and cut into small pieces ripe peaches to fill a quart measure, sprinkle over them half a teacupful of white sugar, and stir often. Bake the cake slowly; when done, the layers will separate readily, and the cake will be much lighter than if divided with a knife. Butter each layer, freely cover one with the peaches, and sprinkle on half a teacupful of white sugar, and replace the top; serve with thin cream.

**ROAST SWEETBREADS.**—Dip partly boiled sweetbreads in egg, then in bread-crumbs; pour over them melted butter, and bake, basting with brown sauce.

**BAKED SALMON TROUT.**—Brown in oven in pan with very little water. Pour over it one cupful of heated cream, pepper, salt, and chopped parsley, and serve.

**CHICKEN CURRY.**—Fry two sliced onions in two tablespoonfuls of butter. Drain and fry jointed chickens in butter—the same butter. Put in pan one and a half tablespoonfuls of curry powder and two tablespoonfuls of butter. Fry three minutes, and add four raw sliced onions. Fry three minutes, add one pint of stock, one small chopped clove of garlic, two green chillies, and salt. Stir, cook down to one third, add chicken, boil up, and simmer twenty minutes. Add one half lemon and two fried onions, and serve.

**ROAST RABBITS.**—Wash, dry, and lay in pan with rosemary, basil, and thyme over and inside. Leave twenty-four hours in cold place. Cover with buttered paper and roast, basting well. Add a little tarragon vinegar to brown sauce, and serve with meat.

**FRIED EELS.**—Cut up and parboil. Dry, roll in salted meal, dip in egg, in meal again, and fry.

## HINTS FOR THE HOUSEHOLD.

**BREAKFAST.**—One needs a great variety of resources for the morning meal, for the appetite is most likely at this meal to be dainty and capricious. The prescriptions in the books are limited in usefulness, and during the changes of seasons the appetite and general health should be especially studied to the end that the breakfast be both relishable and nourishing. Never try to eat at breakfast anything that does not relish well. The appetite and vigour for the whole day may depend on the breakfast, and whatever is served at that meal should be the best of its kind that it is possible to obtain.

A FEW drops of salad oil on tar stains will remove them.

HOT water applied to the back of the neck will relieve nervous fatigue.

TINWARE badly tarnished should be boiled in soda and water before scouring.

OILCLOTH may be brightened by skim milk, using it after the dirt has been thoroughly removed.

CHILDREN'S clothing may be rendered fire-proof, it is said, by adding an ounce of alum to the last rinsing water when they are washed.

THE masculine mind labours under the delusion that picking up something for dinner is a very light matter. If one thing fails, why try something else, and do not let such a trifle worry you; think more of a feast of reason and flow of soul, &c. Do not, however, for one moment suppose that the philosopher will eat cold corned beef and potatoes with cheerful alacrity while his wife tells him of a new spot on the sun, or the latest theory concerning the afterglow.

**APPEARANCES AT HOME.**—Do not say that it does not matter how you look about the house, for it does matter a great deal. It matters for the general credit of the establishment, of which the feminine head is the creditable or questionable representative; it matters in its example to the children and to the help; it matters to the husband and father, who usually, if he is half a man, feels a sense of pride in the appearance of his family. It is poor encouragement to him to find confusion and carelessness in dress, and waste and destruction running riot about his dwelling. It is one of the important duties of every woman to keep herself and her house in a condition as presentable as possible, considering her circumstances.

**GOWNS OF GLASS.**—The idea of wearing dresses made of glass may, at first sight, appear in the light of an impossibility, and yet the great novelty of this season is a material made of spun glass, and which is as bright and supple as silk, with a peculiar sheen reminding one of

the sparkle of diamond dust. This material is to be had in white, green, lilac, pink, and yellow, and bids fair to become very fashionable for evening dresses. It is an Austrian who is the inventor of this material, which is rather costly. Tablecloths, napkins, even window curtains are also manufactured thereof.

**HOW TO CLEAN WINDOWS.**—Simple as the operation may seem, there is a way to clean windows and a way not to clean them. The following suggestions may be of use to some, as they save both time and labour:—Choose a time when the sun does not shine on the window, else it will be dry-streaked, and no amount of rubbing can prevent it. Brush off all the dust inside and out, clean the woodwork around glass first. Use for this warm water and ammonia. Do not use soap. Wipe dry with cotton-cloth. Do not use linen, as leaves lint on the glass when dry. Polish with tissue or old newspaper.

**HARD-WOOD FLOORS.**—It is an easy matter to stain or to oil any hard-wood floor, but it is a much more difficult matter to successfully treat a floor of ordinary make without considerable expense. Such a floor can be covered with a second parquet floor, which is a satisfactory but an expensive way of treating it; or it may be covered with a thinner, less expensive layer of "wood-carpeting." A simple and cheap method of treating such a cottage floor is to have it smoothed down by a carpenter, painted, and the cracks filled in with putty, and finally painted over with several others coats and varnished. The paint for such a floor should be chosen in some dark wood shade, which harmonises with the decorations of the room, never in a conspicuous, staring colour that refuses to lie in place. Probably a covering of matting is as useful as any way of treating such a floor, which is to be carpeted, with rugs. It is not advisable to buy anything but the best quality of Chinese matting. Avoid all the large patterns, which are woven more lightly and do not wear as well as the tiny, closely-woven checks. The Japanese and other mattings in market are excellent for decoration, but do not wear so well as Chinese mattings.

**HARD AND SOFT WATER IN COOKING.**—All cooks do not understand the different effects produced by hard and soft water in cooking meat and vegetables. Peas and beans cooked in hard water, containing lime or gypsum, will not boil tender, because these substances harden vegetable caseine. Many vegetables, as onions, boil nearly tasteless in soft water, because all the flavour is boiled out. The addition of salt often checks this, as in the case of onions causing the vegetables to retain the peculiar flavouring principles, besides such nutritious matter as might be lost in soft water. For extracting the juice of meat to make a broth or soup, soft water, unsalted and cold at first, is best, for it much more readily penetrates the tissue; but for boiling where the juices should be retained, hard water or soft water salted is preferable, and the meat should be put in while the water is boiling, so as to seal up the pores at once.

**TO RESTORE THE FRESHNESS OF WORN CLOTHING.**—Take, for instance, a shiny old coat, vest, or pair of trousers, of broadcloth, or diagonal. The scourer makes a strong, warm soap-suds, and plunges the garment into it, soaks it up and down, rubs the dirty places, if necessary puts it through the second suds, then rinses it through several waters, and hangs it to dry on the line. When nearly dry, he takes it in, rolls it up for an hour or two, and then presses it. An old cotton cloth is laid on the outside of the coat, and the iron passed over that until the wrinkles are out; but the iron is removed before the steam ceases to rise from the goods, else they would be shiny. Wrinkles that are obstinate are removed by laying a wet cloth over them, and passing the iron over that. If any shiny places are seen, they are treated as the wrinkles are; the iron is lifted, while the full cloud of steam rises, and brings the nap up with it. Cloth should always have a suds made especially for it, since in that which has been used for white cotton or woollen clothes lint will be left and cling to the cloth.

## THE MOTHER'S PAGE.

### INDIGESTION IN CHILDREN.

**T**HIS trouble presents different symptoms according as it occurs in children prior or subsequent to the cutting of the teeth. It may occur as an acute form, due to some temporary cause, and then presents symptoms very different from those which appear when the trouble becomes habitual.

The causes of indigestion in children are varied. Most often, however, it is due to an unhealthy condition of the milk of the mother, or where artificially fed, to some error in diet. It may be due to an inherited weakness of the digestive organs, which disqualifies the stomach for digesting even healthful food. When due to unhealthy condition of the milk of the breast, the trouble is due to some constitutional disease of the mother, or results from taking some food which affects the digestion of the child unfavourably. This not infrequently follows the use of green vegetables and fruits. Too hearty a meal of rich food of any character taken by the mother or nurse may precipitate a fit of indigestion in the child.

The state of mind of the nurse also has an influence upon the digestion of the infant. A violent fit of anger or grief has been known to bring on a fit of convulsions, or even to cause death in the child. However, nursing children for the most part escape much trouble from this source. Those which are "brought up on the bottle" seldom complete the first months of life without frequent attacks of indigestion. A diet consisting of farinaceous food is most sure to disagree with the digestion of the infant, while one that is brought up on cow's or goat's milk, properly prepared, although inferior to the natural food from the human breast, are in much less danger from troubles of this kind. The causes which produce indigestion after the completion of dentition are congenital feebleness of the digestive organs, or weakness resulting from frequent attacks of indigestion during the earlier months of life, or from the habitual use of improper diet.

#### THE SYMPTOMS

vary with the conditions above named. When occurring in the nursing child, it is manifest by a paleness of the face, restlessness, peevishness, in some cases crying, nausea, and sometimes simply diarrhoea. When the trouble becomes habitual, the train of symptoms is somewhat different and more severe, and appears in frequent attacks of nausea and vomiting, sometimes with some fever and restlessness, severe colic, with or without diarrhoea; usually, however, the stools are abnormal in character, either presenting particles of undigested food, or appearing greenish in colour. The child is never properly developed. In such cases the appetite is usually fitful sometimes ravenous, at other times almost entirely lacking.

After the period of cutting the teeth is past, the symptoms are quite different. When the attack is acute, it is usually attended by a rise of temperature, which is sometimes very decided. The child may complain of pain, although this is not constant. When the stomach rejects the offending material at once, the attack is passed over in an hour or two, perhaps; but when this does not occur, the fever may become very violent and the pulse may run high, in consequence of which many nervous symptoms may appear, as rolling of the eyes, twitching of the muscles, &c. These symptoms are often premonitory of convulsions, and should always be regarded as foreboding evil. Sometimes convulsions may appear without this warning.

Habitual indigestion in a child of this age is not at all uncommon, and is an affection which demands strict attention, inasmuch as there is often laid at this time the foundation of lifelong suffering from dyspepsia. The symptoms which present themselves are similar to those which would appear in an older person. The

child is not properly developed, the muscles are flabby, the abdomen is usually somewhat distended from the accumulation of gases, as a result of fermentation in the stomach and intestines. There may be frequent attacks of vomiting. Pain in the stomach is usual, although not constant; but the appetite is fickle, and the child tires easily. Picking at the nose is a frequent symptom, and is often mistaken for the presence of worms in the alimentary canal.

The state of the bowels is uncertain; they may be constipated, and they may be too loose, or they may alternate one way or the other. Often if there is diarrhoea, there will be undigested food in the stools. The child is usually very nervous and restless, particularly at night. The tongue may not present any unnatural appearance, but is more often simply furred, and occasionally there is a bad odour to the breath.

Symptoms of this kind should arouse the apprehensions of the parents, and strict attention should be given to the diet of the child, to avoid the consequences of months and years of suffering which are likely to follow. Indigestion is not likely to be mistaken for any other trouble, except in its acute stages in children of one and a half or more years. Then the symptoms are very much like the first symptoms of scarlet fever or diphtheria, and many other acute diseases. Indeed, children have been treated for indigestion when they have been suffering simply from sore throat.

#### EFFECT OF COFFEE ON MILK SECRETION.

DR. ALICE MACLEAN has been studying nursing mothers and the effects of coffee on the secretion of milk. She says:—"In an institution of which I had charge, recently, in which there were some thirty or so nursing women, coffee was served twice a week. Regularly upon these days the nurses in charge reported a scarcity of breast-milk, and there was frequently a necessity for resorting to artificial feeding to eke it out." To this she added that the flow of milk may be increased by farinaceous food, especially the use of the oatmeal and barley-flour gruel. This is far preferable to ale or beer used by so many unthinking persons. If mothers will study how to make these gruels delicious they will enjoy them.

Nursing mothers whose supply of milk is small should not work very hard nor worry, but take life as easy as possible, exercising, of course, enough to promote health, and sleeping enough. If all of the energies of the body are used up in work and worry, of course, according to the laws of the conservation of forces, there will be less energy for this particular function.

Where there is torpidity of the mammary gland, it may be stimulated to action to some extent by the application of electricity. It is not painful, but agreeable to those who are not nervous over the whirr of an electrical machine.

#### IMPURE MILK.

WHEN milk is not known to be perfectly pure it should be sterilised or boiled. A patent steriliser affords the easiest means of doing this, but it may be done in an ordinary steamer. Prepare enough food to last for twenty-four hours. Have ready as many bottles as there are to be feedings (ten bottles is enough for the youngest infant, and by the time it is three months old, seven bottles containing a larger supply will feed it every three hours during the day and twice during the night). Put enough for one feeding in each and plug the mouth tightly with cotton, and do not remove the plug until ready to feed the contents. Place them in the steamer over a kettle of cold water, and bring it gradually to the boiling point, after which boil for half an hour. Let the bottles partially cool before removing the cover to prevent breakage. Keep in cool place, and re-heat as needed by placing the bottle in warm water. Do not remove the plug until ready to slip on the rubber sucking-top. There should be several of these. These should invariably be pure, black rubber, and with two holes as

far apart as possible; where there is but one the milk issues in such a stream as to nearly strangle the little feeder and completely exhaust it. Where the milk is cascaded into the stomach in this manner it is too often immediately thrown up. The child should work for its food, thus causing a flow of saliva. The rubber tops should each time be turned inside out, washed in several cold waters, scalded, and laid in borax water,

#### A CHILD'S FANCY.

"Hush, hush! speak softly, mother dear,  
So that the daisies may not hear:  
For when the stars begin to peep  
The pretty daisies go to sleep.

"See, mother, round us on the lawn,  
With soft white lashes closely drawn  
They've shut their eyes so golden-gay  
That looked up through the long, long day.

"But now they're tired of all the fun—  
Of bees and birds, of wind and sun,  
Playing their game at hide-and-seek—  
Then very softly let us speak."

A myriad of stars above the child  
Looked down from heaven and sweetly smiled;  
But not a star in all the skies  
Beamed on him with his mother's eyes.

She stroked his curly, chestnut head,  
And, whispering very softly, said:  
"I'd quite forgotten they might hear;  
Thank you, for that reminder, dear."

MATHILDE BLIND.

#### SPOON LORE.

**S**POONS have been in use for many centuries. In early times it was the fashion for ladies and gentlemen to have their own spoons and spoon cases, which they carried with them wherever they went. Two hundred years ago we find frequent mention in the newspapers of a "lost case containing a knife, fork, and silver spoon." The spoon was usually described as bearing the crest of the owner upon its handle; or a picture of the Blessed Virgin. The "apostle spoons" were a dozen of these silver implements, each containing an image of one of the apostles in relief upon its handle; sometimes with and sometimes without his name. If the name was omitted, there was usually some emblem of the worthy supposed to be represented on the spoon. In case emblems were used instead of names, St. James would be attired as a pilgrim; St. Jude was usually pictured with a club, the emblem of his martyrdom, or with a boat, to show his occupation; St. Simon, with a saw, because he was sawn asunder, and generally with an added oar, to show his earlier tastes. The use of these spoons as gifts from god-parents to god-children dates back nearly 500 years. When the giver was too poor to present the whole twelve, he gave one spoon with the image of the patron saint after whom the child was named, or to whom he was dedicated, or who was the patron saint of the donor, not always in such cases an apostle. The images of the four Evangelists were often thus used, the spoons being called "apostle spoons," although all were not apostles in the usual meaning of the word. Shakespeare, in "Henry VIII.," when Cranmer declares himself unworthy of being sponsor to the young princess, makes the king reply, "Come, come, my lord, you'd spare your spoons," in plain allusion to the gift expected on such occasions. The earliest notice we find in print of this form of spoon is an entry on the book of the Stationers' Company, made in the year 1500. It is this entry: "A spoyne of the gyfte of Master Riginold Wolfe, all gylte, with the pycure of St. John," showing that "apostle spoons" were well known at that early day.

HE who walks daily over his estate finds a coin each time.

**STEADMAN'S** Soothing Powders for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, &c., and preserve healthy state of the constitution during the period of teething. Manufactured only at Walworth, Surrey. Sold everywhere. Please observe the **EE** in Steadman.

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—*Daily Chronicle*.

[SPECIAL ARTICLE.]

## LOOK TO THE FIRST TEETH.

By RUSSELL ARGYLL.

WHILE listening to an interesting conversation between two dentists, eminent in their profession, it seemed to the writer that much suffering among children might be prevented if some of their observations and suggestions were given to those as yet ignorant of the matter. In order that we may realise the necessity for earnest consideration of the subject, let us recall two out of the many incidents related from their long and varied experiences. A note was one day brought to Dr. W., requesting him to come as soon as possible and remove an aching tooth. The little patient of seven years was soon relieved of the offending tooth, but was in wretched physical condition—thin, as to flesh, sallow, fretful, complaining of headache most of the time, and with exceedingly variable appetite; restless at night, often unable to sleep.

"I'm doctoring her for worms, but she is no better than when I began," said her grandmother.

"If you will bring her to my house, and let me fill her teeth, she will be well in forty-eight hours," was Dr. W.'s reply.

"What! fill a child's first teeth? You must be crazy, doctor!"

"No, madame; a child's first teeth should always be filled upon the slightest appearance of decay; then they will fall from the gums without pain, and you will never need to fill the second set, so, you see, you lose nothing, but gain a great deal."

"Well, it seems very foolish to me to waste filling on first teeth."

"I fear you will regret not following my advice, but of course I cannot insist."

Weeks passed away, and one day, upon entering his house, Dr. W. found the old grandmother awaiting his return with intense anxiety. Her grandchild was too ill to leave her bed, and the family physician had given up her case in despair, so as a last resort she had come to ask Dr. W. to try what filling of the defective teeth would accomplish for her. The busy dentist could not resist the tearful appeal, and in a few moments was on his way to the suffering child. He filled a mouthful of defective teeth, removed some decayed roots, left a wash for the fever-tainted gums, and then returned to his house.

In less than a month the child was as healthy and happy as could be desired. One by one her teeth dropped out without giving her any trouble, and a beautiful new set took their place. The grandmother could not say enough, could not do enough to show her gratitude for the salvation of her grand-daughter.

"There are many substitutes for gold which can be used in such a case," said Dr. W., "as the teeth are but temporary, so the expense need not prevent parents from affording the child relief."

"Was this a solitary case, Dr. W.?"

"By no means. I have seen the most violent convulsions caused by decaying teeth in a child's mouth; in fact, I do not exaggerate in the least when I say that two-thirds of all the diseases which prey upon children from five to twelve years, and often longer, are the direct result of defective teeth, and could be entirely avoided by filling the teeth as rapidly as decay appeared. Nor does the evil cease when the first set has crumbled away. By contact with these decaying teeth the gums are rendered unhealthy, and the new set comes in predisposed to decay. Often the gums are so badly diseased as to remain so until the second teeth are removed, and even then a long time may elapse before a plate can be worn. I have known some cases in which they never healed, but developed a painful affection of the jaw-bone, thus causing intense suffering throughout the whole life."

The second case mentioned was that of a young girl for whom a not too careful dentist had filled teeth. The peculiarity of this trouble, most noticeable at first, was that the teeth themselves did not ache. Several days

after the filling Jennie complained of headache. Nothing remarkable in that; so little attention was paid to her complaint beyond the application of the usual remedies. Later she became insane, with lucid periods in which she would press her hands upon the back of her head and say, "It feels so full, so queer." When she became quite unmanageable her friends carried her to a private asylum. The treatment, however, failed to cure her. One day she complained of toothache and was taken to Dr. W.'s consulting rooms. He examined her mouth carefully, and gave it as his opinion that if the front teeth were removed Jennie's mind would probably recover its wonted tone. Oh, no! Neither parents nor child would believe so strange a thing. Well, she grew worse and worse, the paroxysms increasing in violence until at last, rather than see her a confirmed lunatic, her parents consented to the removal of the teeth. So the dentist won his way in the end, and the offending ivories were removed. When the profuse bleeding ceased, Jennie pressed her hand over her mouth, saying, "Oh, my pretty teeth are all gone!"

"Never mind," replied Dr. W., "I will make you some new ones that will look just as pretty, and that won't hurt you."

Presently the girl exclaimed, "Why, the heavy feeling is all gone from my head! It doesn't hurt any more!"

And it never did hurt any more; reason resumed her sway, and a few years later she became a happy young wife. "What was the trouble?" Why, the filling pressed upon the sensitive vessels leading from the teeth to others which communicated with the brain. Intense inflammation was produced, which increased until that most delicate of organs gave way completely and lunacy was the painful result.

"Ah," said Dr. W., "people have no idea how many of their fellow-creatures might be relieved of prolonged suffering if the cause, that is the teeth, were but removed. I may be called a fanatic, but I am willing to abide by what I say. If parents would see to it that the first teeth were cleaned, and filled upon the first appearance of decay, the second set would remain sound until extreme old age, and in nine out of ten cases would never decay. You would cease hearing of facial neuralgia, of disorders of the stomach, coated tongues, foul breaths, and many other troubles attributed to the presence of worms and what-not by mistaken mothers."

A case, which shows the old doctor to be right, came to the writer's knowledge, and seems of sufficient importance to relate in this connection. A large family had died, one after another, of "tubercular consumption;" two small children were left, but they, also, were showing the same symptoms, and would follow in the same way. The distracted mother spent many sad hours in meditation upon the subject. "Could she not save these, the last of her flock?" The father had been taken before the youngest child's birth. While thus meditating, this subject—the care of the teeth in little ones—came to her observation. Eagerly she seized upon it as her only hope; the children were taken to an excellent and conscientious dentist, loose and broken teeth were extracted, decayed ones cleansed and carefully filled, a simple mouth-wash to be used twice a day provided, and the work was done. To the mother's joy, the children began to improve in health, the sickly hue left their complexions, their appetites became natural, and now you would have to search long and far to find a healthier pair than they.

Passing all these incidents and remarks in mental review, it seemed eminently proper and right that they should be placed before those readers who had not yet given the subject careful consideration. Many a sickly child is being nauseated with drugs, suffering untold pain, who could be relieved in a few hours of present suffering, and spared unnumbered pangs in the future. Surely we ought to give earnest heed to any sermon which has for its text the alleviation of suffering, especially when the subject is a child, too young and simple to listen and apply for itself.

HE is great whose faults can be numbered.

LAWNS *versus* FEVER.

"That danger is most to be feared that lurks unseen, unrecognised."

IT hadly seems possible to one gazing on a beautiful, well-kept lawn, that it can be anything but "a thing of beauty, a joy for ever." As it spreads out before us, its green, velvety coat rivaling costly plush in softness and hue, interspersed with here and there a gay and fragrant flower-bed, or more rare plant or bush, it invites admiration, and challenges us to defend it against so base a calumny as its concealing aught of danger to anyone or anything. "What would the city be without lawns?" What, indeed, save a dreary expanse of dusty, dingy brick, and pavement! "Take away the lawn, and you rob many of all knowledge of the wonderful works of God, since the lawn is all they ever see of Nature's work, city prisoners that they are!" says some philanthropic soul—and he has the approval of a large host.

No, we cannot spare the lawn. But we must not overlook the possibility of their not being "unmitigated blessings" because of their desirability, no matter how they are treated. It is right here, the treating, or rather mistreating of them, that the danger arises. One of the necessary elements of a thrifty lawn, be it large or small, elaborate or otherwise, is water; it also seems to be an unwritten law that the more water the better, since lawns, like fish, cannot drown. It does not seem to make any difference to the lawn when or in what quantities it receives its daily ablutions, hence its owner chooses the time most convenient to himself or herself, which time is usually the worst possible one for the community in general and the owner in particular, namely, from sundown to midnight, and if water be plentiful, all night. People who would be horrified at living near a rapidly running stream, placidly lay themselves down to repose with open windows, surrounded by a water-soaked lawn, and are not at all afraid of dampness. Strange, isn't it? Fair pedestrians, in thin shoes, are also made happy by receiving gratuitous shower-baths at not rare intervals from dripping trees, shrubbery, and hose placed conveniently near the walk, while the embryo streams that meander over the thirsty (?) sidewalk insure thorough dampening of the feet. That the owner of a new carriage does not always appreciate the public spirit that has watered, not only the lawn and sidewalk, but has, in zeal to lay the dust and allay the temperature, extended operations to the street, making it decidedly muddy, is not serious; it is the fate of the philanthropist to have his motives questioned.

Beside unremitting watering, the lawn also needs the almost daily services of the lawnmower. Many authorities maintain that much of the *débris* thus gathered should be left on the ground. Be that as it may, with the greatest of care, much will be left—that is, much when one considers how little Nature needs to accomplish wonderful results, working, as she does, with quantities beyond the ken of microscope or chemist always to measure.

Little as we really know about fever, its origin and exact physical properties, we are abundantly informed as to the results when a person is poisoned with it, and we know somewhat concerning the laws that govern its formation and distribution, to wit: given a certain amount of moisture, a certain amount of decaying vegetable matter, and a certain average temperature of 60 degrees, or thereabouts, and we have all the elements necessary for the successful raising of a crop of fever. Now is there not good reason for suspecting that a lawn, treated as the majority of them are during the so-called "dog-days," may add its quota to the atmosphere, and while the single lawn would be insignificant and harmless, the sum aggregate be worth considering?

The remedy is simple and easily applied, while it will not in the slightest degree endanger the beauty of the lawn: Use the hose (if the rules governing the use of water permit) either in the morning, or so early in the afternoon that all superfluous water will be eagerly taken up by the heated air, to be given

"The FAMILY DOCTOR will be found of great use in every Household."—*Sportsman*

back again as dew when Old Sol shall have disappeared. This plan would save many an evil that arises from wet feet; would cause the disappearance of that sore throat every morning, which troubles some during the hot weather, when, if ever, one should be free from such trouble; while as a breeder of fever germs the lawn would be *non est*, and would be a joy without alloy.

## CHOLERA.

AT the meeting of the Balloon Society, held at St. James' Hall, Piccadilly, on Friday, September 22nd, 1893, a paper was read by Dr. Gutteridge on the above subject.

The lecturer justified the bringing of medical subjects before a popular audience, and in a popular form, by referring to the necessity for diffusing a knowledge respecting a matter of vast importance, which was undoubtedly occupying a large amount of public attention. Cholera had become one of the sensations of the day, it was consequently given a prominent position, and took up some considerable space in every newspaper, whilst questions concerning it were almost daily in the House of Commons. It could scarcely, therefore, be a matter of surprise that a scare had been created, which might soon have become a panic, than which scarcely anything more prejudicial to the general health could well have occurred. It was somewhat difficult to conjecture how this could have been brought about, seeing that the real facts of the case in no way justified such a feeling, for, except in a very few imported instances, no true Asiatic cholera had been met with. Cholera, being a disease quite by itself, is easily distinguishable by its symptoms, course, and too usual termination from choleraic diarrhoea, or any other ordinary summer or autumn affection. Next, the history of cholera was briefly traced, and the periods and undeviating method at and by which, through the various ports since 1830, when it first appeared in Europe, it had in 1847, 1853, and 1865 been introduced into England.

It had proved it was admitted a terrible scourge, when and wherever it had prevailed, alike in temperate climates like our own, and more especially so within the torrid zone. But its ravages had been most terrible where sanitary matters were most neglected. Cholera had been warded off us by the strict observance, to the credit of the authorities, be it said, of well-planned regulations at all our ports, and at the present time there was more than a warrantable expectation, if our vigilance were not relaxed, that we should again escape, comparatively, if not entirely, unharmed.

Cholera is by no means an unmixed evil. It sternly bids us to keep ourselves, our houses, and surroundings, clean and wholesome; to be cheerful, hopeful, and trustful in our dispositions, regular in our habits, strictly temperate in eating and drinking, and sensible in our clothing. We are much better than we were, but there is yet room for improvement.

The London of to-day is far better in most respects than the London of 1847 and 1865, but still the slums are not extinct. The infamous housefarmer still fattens on the necessities of his poverty-stricken victims. The sweater is still to be met with; vice stalks too prominently and freely in our midst; and rags and destitution, too frequently the result of intemperance, sloth, reckless hardihood, and downright viciousness. The victim has become abandoned himself before he is abandoned by society, so that there is still room for improvement socially and individually, and this must be far more thorough, more constant, and universal before we can either expect or deserve to be free from threatened cholera invasions.

As prevention against the spread of either cholera or choleraic diarrhoea, every case of illness should be properly attended to. If cholera of the true Asiatic type should really come, and it is far off coming, yet, if it ever does, there must be no experimenting, scientifically or otherwise, and such remedies alone resorted to as reliable experience and governmental records have proved to be efficacious in effecting a predominant number of cures. No

great outlay in the erection or providing of hospitals need be demanded, but willing hands animated by brave hearts to wait on those who can fortunately be treated with the greatest hopes for success in the homes in which they may be stricken. Under such circumstances they have had the simple but effectual application of the wet sheet rubbed vigorously around the patient whom it envelopes.

The one medicine on which such reliance was placed, and such triumphs rewarded its use, in the great outbreak in unsavoury Naples was a strong solution in spirits of wine of ordinary camphor, a few drops on sugar, both in the premonitory stages and throughout the whole course of the attack, until its abatement. The patient, when stricken, and confined strictly to the horizontal position, not being allowed to raise the head in the least, nor to have anything between his lips, except the medicine and crushed ice. It may be remarked in conclusion, that bacteriologists are not agreed amongst themselves as to the part the bacilli occupy in causing cholera; Pettinkoffer, demonstrating their harmlessness by swallowing a considerable quantity, no effects following. Purity of the water-supply is absolutely essential, and sewage soakage, in however minute a quantity, to be avoided, or remedied thoroughly at any cost. The following resolution was adopted:—Proposed by Surgeon-General Sir William Moore, seconded by Dr. Goodsall, "That the Government be urged to continue their unremitting attention in enforcing the regulations at all our ports with reference to the detention, when necessary, of all suspected persons and goods."

## WHAT MAY WE EAT OR RINK?

A CORRESPONDENT writes to us in the following strain:—If an alleged man of science always tells the truth the state of man is indeed most pitiable. His most innocent appetites are a curse. He craves food and drink, and he has never succeeded in living very long on this planet without either. But whatever he takes into his stomach is his mortal foe.

Scientific physiologists tell him that alcohol is a deadly poison, and attempt to protect the human stomach against all alcoholic drinks by law. What, then, shall man drink? Water! No, indeed. For here comes a man of science, armed with a microscope, and tells us that water taken internally kills more people than any other known substance. It is the principal vehicle by which all manner of disease germs are swiftly borne from city to city and from continent to continent. Even such water as contains no living monsters to destroy life is saturated with poisonous minerals and gases. Let no man drink water if he would not die of cholera, or typhoid fever, or some other mortal malady. Boiling the water may kill the animated germs, but it does not destroy the mineral poisons, and if you add tea, coffee, or any other substance to boiling water, you only make an infusion more destructive than water itself.

Shall we then drink milk? That appears to be Nature's own provision for the gratification of an appetite which seems to have been one of Nature's mistakes. But we must shun milk. Cows are subject to pulmonary and other diseases, for they, too, are cursed with an appetite for food and drink, and they, poor creatures, have no scientists to tell them that the only way to prolong life is to abstain entirely from eating and drinking. And so it happens, that if we drink milk and swallow consumption, scrofula, and science alone knows what else, that is sure to send us to our long homes.

There is nothing that we can drink with safety. Shall we then eat? By no means. We must abstain, not because the pure food associations, with their scientific chemists and microscopists, assure us that animal food is diseased, and nearly every other kind is abominably adulterated, not excepting sugar or flour, but because every article of food contains more or less of our remorseless enemy, water. No, there is nothing in all this world that we can either eat or drink. There is death in every pot.

## THE PREVENTION OF PHTHISIS.

ARGUMENTS followed to their logical conclusion lead us at times into awkward places, and seldom does a practitioner find himself so torn by the conflicting claims of the theoretically right and the practically possible as in deciding on a course of treatment, and of home *régime* for a patient suffering from phthisis. Facts, microscopes, and pathologists tell us that tuberculosis is a parasitic disease. Theory, and it may be added a certain amount of practical experience, asserts equally strongly that it is infectious, and that consumption always arises directly or indirectly from some preceding case. Logic then steps in, and urges the isolation of our consumptives, if we would save our healthy ones from catching the disease.

And yet humanity says just the opposite. Few sights appeal with greater force to popular sentiment and kindly sympathy than that of the tender care and unwearied nursing lavished by strong brothers and loving sisters on the fading flower of the family; and yet few can be more horrible to the physician who believes in the infectiousness of phthisis, and in whose mind the picture is interwoven with glimpses of the dark future when one by one these kindly nurses shall droop in turn.

Where, then, is the truth, and what shall the physician say when he has to arrange the mode of life, and the relationship to others in the family, which shall be adopted by the one who is first affected? Have we yet got all the facts? Does the rough assertion that consumption is infectious, or even the finer inference that dust is the vehicle of infection, cover the old ground? And may there not be other conditions necessary to its propagation of which as yet we know but little?

That this is no mere academic question is made evident enough by the fact that at the present time a movement is on foot which aims at the compulsory notification of phthisis, and the erection of great State hospitals for its reception and isolation. The example of our forefathers in regard to leprosy is being held up as worthy of imitation in our dealings with tuberculosis, and we are told that the true way of preventing phthisis is to isolate the phthisical.

In the *Medical Magazine* for last May Dr. Chaplin advocated—(1) the prohibition of marriage among those with a strong hereditary predisposition to the disease; (2) that when once a patient has been notified as having phthisis he should be prohibited from frequenting theatres, churches, tramcars, railways, and all public places; (3) the establishment of hospitals for the compulsory segregation of persons dying of consumption; and although he admits that in the present state of society such a scheme is at best wild, he holds that when phthisis is clearly seen to be dangerous, it will not appear so far-fetched. At a meeting of the Society of Medical Officers of Health, held some time ago in London, it was moved by Dr. Niven that "tuberculosis should be made a notifiable disease, notifiable under the same Acts and under similar conditions to such diseases as scarlet fever," and "that isolation hospitals should be provided by sanitary authorities, jointly or separately, at the expense of the rates, for the isolation of cases of tuberculosis likely to cause infection;" and although when the matter came up again for discussion at their meeting at Newcastle a much less stringent resolution was adopted, the proposition was at the same time fully accepted "that phthisis is an infective disease, in the prevention of which active hygienic measures should be taken." These things show what is in the air, and make us ask how far such views are justifiable.

No one accustomed to watch the varying career of consumptive patients during the long and often curiously interrupted course of their disease can fail to see how serious an interference with ordinarily accepted ideas of liberty would be involved in such a complete isolation as would be in any degree effective for its purpose, or how small would be the usefulness of mere voluntary segregation, which would certainly only be accepted in the later stages of the disease.

During the greater part of the progress of his malady a sufferer from chronic phthisis may be neither a helpless invalid, nor dependent on his friends, nor a burden to the rates. He may carry on his daily work, and be as full of hopes and of ambitions, and almost of usefulness as any of his neighbours. Many a business has been built up and fortune made, many a reputation has been gained and life's work done, during those intervals of semi-health which figure so largely in the diary of a consumptive's life.

We do not say it is impossible to segregate the phthisical, but, in view of present ideas concerning the liberty of the subject, of the long distance we are yet from the complete isolation even of the more definite infectious fevers, of the difficulties we find in overcoming private rights in regard to nuisances and adulterations, and of the tenderness we exhibit in curtailing the liberty even of habitual drunkards, we may well question whether the proposal to shut up the great army of consumptives, by a mere *lettre de cachet* comes within the range of practical politics; nor is it easy to suppress the thought that nothing short of a danger which could not be escaped or mitigated in any other way would justify a community in inflicting on any of its members so ghastly a punishment as taking them from their homes, their hopes, and their ambitions, and setting them to live out their lives in lonely isolation, separated from their friends and relatives, amid the dull monotony of workhouse or of hospital.

All evidence goes to show that, putting on one side infection by food, which comes under a different branch of sanitary work, the great and constantly acting cause of phthisis is the respiration of phthisically infected dust, and that the source from which the dust becomes infected is the sputum of consumptive patients. Whether we look on the large incidence of phthisis on those who pass their time in dusty workshops, and who dwell in dirty ill-kept homes as proof of the direct infectiousness of the disease, or whether we accept the view, held by some, of the saprophytic existence of the bacillus tuberculosis—that is, of its power to develop apart from the living body, to live and grow on damp walls in dark dwellings, as distinct from its merely resting there as a spore, and thus to make the disease become endemic in "tuberculous infective areas"—in either case we must look to dust as the means of communicating the infection, and to want of cleanliness as the cause of its continuance. We wish we could feel sure that the medical profession at large recognised, as fully as the facts warrant them in doing, the infectiousness of tuberculous sputum, and the danger of letting it dry into dust.

The main fact is, that the dust constitutes the danger. May we not, then, hope that if this recognised mode of infection can but be controlled, at the same time that war is being made against the known predisposing causes—want, dirt, and overcrowding—we may escape the necessity of shutting up our consumptives?

As a charity to a most suffering class, we admit the desirability of hospitals for the reception and the comfort of patients in the later stages of consumption, whose work in the world is done, and who are a source of danger to those with whom they are cooped up in the crowded dwellings of the poor; we would gladly also see the State take a large part in their support and in the relief of those who, after all, are but the victims of its own complex civilisation; but that is a very different thing from shutting up all cases of the disease which may be thought capable of causing infection.

Nor need we feel that at the present time we are standing still, or that nothing is being done to limit the spread of tuberculosis. As a matter of fact, a great deal is being done in an indirect, but none the less efficient, way; and already the result has been that, without any attempt at isolation or attention to the sputum, the general phthisis rate of the country has

sunk from 2·6 per 1000 in 1867, to 1·54 in 1889, a diminution greater than can be seen in most diseases. This as taken place as the result of general sanitary measures, better food, drier houses, more light, more air, and it is difficult to say how much greater the improvement might not have been, and may not still be, if, in addition to all such measures, a consistent and methodical warfare be waged against infectious dust, for which purpose we must insist on the use of the spittoon, the substitution of pieces of paper or of calico, which can be burned, for that horrible thing the consumptive's handkerchief, the abolition of ornaments and knick-knacks in the sick man's room, and the replacement of the duster by the damp cloth. Great things can be done by attention to small details, and if we can entrap the vehicle of infection, isolation may become as unnecessary as it now appears impracticable.—*British Medical Journal*.

## PHYSICAL CULTURE.

### A PRACTICAL SYSTEM FOR WOMEN IN SEARCH OF BEAUTY.

AS physical training is engaging the attention and consuming the time of young women everywhere, Mrs. Bridget Maguire and Miss Mary Hann have organised a school and prepared a course of lectures for the purpose of introducing their system of physical culture. They are also about to publish a book, "The International System of Physical Culture Explained," the advance sheets of which are already out. Below we give the principal exercises peculiar to this system:—

1. Take a scopæ (the high Latin name for broom) in the hands, which should be held at half reach reversed grasped, allowing the bushy portion of the scopæ to rest upon the floor and holding firmly to the upper end of the handle. Bend the body slightly forward, give the arms a horizontal movement, lift the scopæ slightly, and move one foot before the other. Repeat these movements until the scopæ has been brought in contact with every portion of the floor.

2. Holding vertically in the hands a long pole to which a bundle of feathers has been attached, bend the body backward from the waist, throw the head well back, and elevate the arms until the feathers rest lightly against ceiling or walls. Move the arms back and forth, carefully holding the pole in position. In a similar exercise, more frequently practised, a shorter pole is used and the feathers are allowed to pass over the different objects in the room. But this, while excellent for the arms and shoulders, does not call into play the muscles of the spine, neck, and chest.

3. Kneeling upon the floor and grasping a wet cloth in the hands, bend the back till the cloth touches the floor. Press the hands down firmly, throw the weight upon the arms, bending them at the elbows as the motion of the hand requires, and pass the cloth briskly over the surface of the floor.

4. Fill a large basin with water, and place obliquely in it, so that the lower edge shall rest in the bottom of the basin, and the upper one lean against the opposite side, a corrugated piece of wood covered with zinc. Then take some sort of cloth, souse in the water and rub briskly on the board. A little soap will lessen the friction and render the exercise somewhat more gentle.

5. Take a cloth, treated as above, dip into a paste composed of amydon and aqua pura—that is to say, pure water—and allow it to become almost dry. Spread on a smooth surface and pass quickly over it a well-heated ferrum planum, or smoothing-iron, bending the back and swaying the body lightly to and fro, in unison with the motion of the implement in the hand.

As the majority of young women are probably unacquainted with the implements used in these exercises, either of the ladies whose names are mentioned above will cheerfully supply all

necessary information. Object lessons are also given, gratis, each day at the Opus Domus Institute.

One great advantage which the international system possesses is that while other systems can, at best, benefit only the individual who practices them, the international, when carefully and regularly carried out, will bring the best results to an entire household.

## WHAT IT FEELS LIKE TO TAKE CHLOROFORM.

*Notes from an Actual Case.*

THE writer has frequently been asked what it feels like to take chloroform, or like gases, so the actual are recorded of a case.

SCENE: A whitewashed room in a country hospital, a surgical couch in the centre, a nurse standing ready with a basin and a sponge, two relatives of the patient, who enters room clothed in a dressing-gown. The operator, who is about to remove the breast for cancer, is busy threading some needles with catgut, and the administrator of chloroform turns to the patient and says: "Now, Mrs.—, don't be afraid, you are quite safe," assists patient on to the table.

Patient's lips seem moving in prayer, and whilst the administrator is listening, to be sure that the heart is sound, he catches the words, "Lord Jesus," and "Children."

Administrator to Patient: "Breathe this gently, and deeply." Proceeds to gradually bring the inhaler over face.

Patient coughs, and complains that the "stuff chokes her."

Patient, aside (narrated afterwards), I thought of my children, and then my ears began to buzz, and my head felt as if it would split, and then I began to feel sick.

Administrator to Nurse: "Pass me the tongue forceps." proceeds to pull the tongue forward.

Patient retches, and so is turned over on her side for a few seconds, until the spasm has passed off.

Patient presently commences to throw herself about and sing; saying, "Yes, I will. Ta-ra-ra—Yes, he told me that—Boom-de-ay—Wait till the clouds roll by." Struggles to get up, and fights to the consternation of friends, to whom the doctor quietly remarks, "It is always so, this is the noisy stage, she will soon be under."

Presently patient quiets down, and begins to breathe deeply, slowly, and with a noisy expiration sound, and the administrator, after satisfying himself by the flaccidity of the limbs and the insensibility of the conjunctiva, remarks to the operator, "She is under," and the operation is proceeded with and finished in about twenty minutes. When the dressings are being put on the administration of chloroform ceases, and the doctor gently slaps the face of patient, and says, "Now, Mrs.—, don't you know its time to get up?"

No response, but a slight raising of the eyelids.

In a few minutes there are signs of recovering animation, and the patient feebly asks, "Where am I?" Later, "Is it over?" and two or three minutes afterwards says, "Thank God."

On inquiring afterwards patient declares she remembers nothing, nor did she feel anything after the choking sensation.

NOTES:—There are only one or two deaths from a kind of tonic poisoning during the administration of chloroform in 10,000 cases. Persons do not let out their secrets when under gas, because the cerebration is disjointed, and the sentences are such that usually neither head or tail can be made of them. When the number is considered of half-dead diseased bodies, together with the frightfully mangled persons, who are put under gas in order to save their lives, is it not marvellous that there is not more accidental extinguishing of the feeble flicking life's flame than there is?

"THERE IS UNQUESTIONABLY" no better remedy in the whole world for all cough and throat troubles than KEATING'S LOZENGES—any medical man will assure you of this fact. Relief is speedy; they contain no strong acting, but only simple drugs; the most delicate can take them. Sold everywhere in 134d. tins.—[ADVT.]

"PURE CEYLON TEA."—The increasing demand for a pure Ceylon Tea has induced HORNIMAN & CO. to specially import a selection of the choicest teas grown in that country. HORNIMAN'S "pure Ceylon Tea" is of wonderful value and of refined and delicate flavour. Sold by Agents in packets only, 5d. per 4 lb.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 1d. and 2s. 6d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, E. T. TOWLE, Chemist Nottingham. Beware of imitations, injurious and worthless.

"The FAMILY DOCTOR. The contents are varied and useful, with an entire absence of Quackery."—*Observer*.

## WATER AS A REMEDY.

**W**ATER is too little valued by the generality of people as a remedy, yet is one of the most valuable. It is not only a food—three-quarters of the body, by weight, are composed of it—but a medicine, which is not properly replaced by the use of tea, coffee, or milk. If more water were consumed and less beverages, there would be fewer dyspeptics, rheumatics, and bilious sufferers. A glass of water taken at night before retiring and the first thing in the morning will often obviate a tendency to constipation, and with dyspeptics a glass taken hot or cold before meals will be found efficacious, washing out the stomach and putting it in better condition to digest the food. With a little lemon juice added and drunk freely it is useful in rheumatism.

As a means of applying heat and cold it is invaluable. In the first stages of a sprain, if hot water is applied, hot as can be borne, and the application renewed constantly, the following day will see the part comparatively free from soreness and capable of being used. If it is an ankle, the foot may be placed in a foot-tub of warm water, the heat being raised by addition of hot water, and the temperature being kept up to the limit of endurance for an hour or so. Similarly in rheumatism, hot baths and applications are useful.

With children the warm bath is a sleep producer in nervous irritability, allaying convulsions, and a rapidly acting stimulant in cases of emergency. Its efficacy may be increased by the addition, in some cases, of a tablespoonful of mustard flour to the gallon of water. The child should be stripped and placed in a bath, and held there not over five minutes, or till the mother's arms tingle. In cases of cold or congestion of some internal organ, as the lungs in pneumonia, it is again the remedy *par excellence*, acting by bringing the blood to the surface.

## CONSTIPATION.

**I**T is a difficult matter to lay down a hard and fast rule as to how often a person in full health should obtain a movement of the bowels. The requirements of Nature would seem to be properly fulfilled in some individuals by one motion in two or three days, while in others, if an action does not occur daily, disagreeable symptoms soon intervene. We may conclude pretty safely that matters are proceeding satisfactorily if there be no nasty taste in the mouth, no pain or discomfort at the time of evacuation, no lethargy, and no sense of fullness across the abdomen or pain over the forehead. But if any of the symptoms be present, attention should at once be paid to regulating the torpid bowels. Delay is dangerous, for many complications are plainly traceable to neglect in this particular. No! you need not undergo the discomfort of purging, for if you do, as is the case when you take castor oil, patent pills, and similar out of date preparations, be sure this violent measure will only result in temporary relief. Take a mild laxative remedy, such as one or two Laxative Palatinoids at bedtime. These will not cause any discomfort whatever, nor will they hinder the ordinary daily pursuits, but will rather establish regularity. At the same time, if you suffer from liver inaction, it may be this member that is at fault. You may possibly have forgotten your morning dose of Oppenheimer's Euonymin Cocoa. Well, the only advice we can give you is, don't forget it. It is just as delicious in flavour and taste as the finest Caracas cocoa, so there is no excuse for you. When the constipation is due to the inassimilation of starchy foods, which you may easily tell by a sense of fullness and pain being felt across the abdomen about an hour or so after a meal, take a tablespoonful of plain Cream of Malt with your meals. The reason of this is obvious, for the malt has a peculiar solvent action upon all starchy substances. Make an effort at evacuation daily, whether the desire be felt or not, for after all we are but "creatures of habit."

The soldiers fight, and the kings are heroes.

## PROMOTION OF KINDNESS TO ANIMALS.

**S**IR WILLIAM H. FLOWER, President of the Zoological Society, presiding on September 23, at York, at a meeting of the Church of England Society for Promotion of Kindness to Animals, said that cruelty was best prevented by promoting kindness. Much of the cruelty to animals arose from that part of man's nature which was inherited from his savage ancestors, who for generations had depended for their existence entirely upon their power of capturing and killing living animals, either in their own defence or for food. For a vastly long period of human life, man's only idea of an animal was something to be killed, if not to be eaten, and still even now among civilised nations something akin this feeling was born in every boy. There were few pleasures more universal and more intense, than those derived from the chase. This natural propensity must be recognised in order to be judiciously dealt with. The justification of field sports consisted in their being carried on in such conditions that the advantages to man in promoting his health, strength, endurance, and other valuable qualities, to say nothing of the food supply from this source, were so great as to counterbalance whatever evil was inflicted upon the objects of the chase. It was necessary to avoid exaggeration in any particular aspect of the question, but to take a comprehensive view of the whole conditions of the natural world, where it was the rule rather than the exception that living animals come to a sudden, violent, and often painful death. It was part of the universal order of providence that beasts, birds, fishes, insects, and the rest of the living world should be all preying one upon another, and the additional destruction by man, if attended by due limitations, was, comparatively speaking, most trifling. There could be no doubt that a higher sense of man's responsibilities to animals was one of the signs of general progress in the civilisation of the world. The claims of animals to friendly treatment were now generally accepted. Boys should be taught that there was no merit in showing their power over animals by trying to destroy or injure them. They would find in time greater pleasure in cherishing life than in destroying it.

The Rev. F. Lawrence, vicar of Westow, York, Hon. Sec., said that the Royal Society for the Prevention of Cruelty had done, and continued to do, a great work. Bands of Mercy had exercised a beneficent influence in many parts of England. Yet there was still wanting, especially in remote districts, a local agency in every parish. The organisation of the Church, with officers in every parish possessed of unique authority and influence, afforded a means by which persons of all ranks, and of all schools of religious thought, could be banded together for any good purpose; while the very fact of the Church making an active concern for animals part of its official work, would remind everyone of the duty man owes to animals. Thus it had come about that a Church of England Society for the Promotion of Kindness to Animals had been established at a meeting held at the Church House, Westminster, under the presidency of Sir F. G. Milner, Bart., M.P., with a view, not of superseding existing institutions, but of aiding them. The authorities of the Church could suggest a day on which in every pulpit mention might be made of the claims of animals. The education department could make study of animal life part of the curriculum in every State-aided school, cognisance being taken thereof at the annual inspection.

ALL IS NOT GOLD THAT GLITTERS may be said about many brilliant prospectuses that are frequently issued to financiers; they often herald the formation of companies which go up like the proverbial rocket and come down like a stick. Holloway's Pills and Ointment, unlike such shaky ventures, are the soundest investments in which people suffering from disease can entrust their money. They have the reputation of over half a century, and every day they return substantial dividends in the form of good health. No disease has yet disputed their influence when a fair trial has been given. They cure dysentery, diarrhoea, weakness, and liver and kidney diseases, whilst for skin diseases they have no equal. Sold by all chemists, &c.

tion. Encouragement could be given to technical instruction by means of popular illustrated lectures, with a view of all animals being treated on scientific and therefore humane principles. A literary league might be formed with the object of making greater use of the Press everywhere, so that a newspaper would seldom appear which had not in some corner a few words about animals. The gain of such concerted action would be enormous. Every living thing would be regarded from a higher standpoint, and the practice of cruelty grow less and less. Kindness to the lower orders of creatures would beget greater kindness from man to man. Soon the law for the protection of animals would be improved. A reproach would be removed from the Church, and her influence enhanced. England's example would gradually affect the Continent and the far East. Reverence for every living thing would give life a fresh charm, and make life in rural districts more attractive.

## EXERCISE AND PERSPIRATION.

**W**ITHIN the last few years a new way of reducing weight has become popular.

This does not so much reduce a man's total weight as it prevents the increase of weight in the stomach, which is what most men want. A man who is growing stout would not care if the increased figure which appears every time he steps on the scales were to show that he had larger arm and leg muscles, that his chest had increased in size, and that he had a bigger frame; but when he sees the evidence before him that the more pounds do not mean these things, but an increased waist measure, he thinks of methods to reduce his weight. The thing is to take off the fat about the waist. A simple way is to sweat. Sweating a man reduces his weight. If the total sweating could be taken from the stomach and the loins, the weight of the stomach and the loins would be decreased, while the plump shoulders and round arms and legs would be retained. The simplest way of sweating the stomach and the loins is to wrap enough flannel around them and then take some exercise. It is not necessary to take violent exercise, though violent exercise will do it. With enough flannel around his stomach a man can sweat his stomach without sweating the rest of his body.

A man can wear a flannel stomach bandage without any one knowing it. Perhaps the best is the kind that a man has especially made for him, though it costs a little more than the others. He can buy eight or ten yards of the best and most porous flannel, and the person who makes his shirts will make the bandage for him. He is measured for it, and when it is done it is shaped like an hour glass, though the top circumference is smaller than the hip circumference. It should cover a man from his hips to the lower part of his breast bone. Buttonholes are made in one end of the bandages, and buttons set back a few inches from the other end. The bandage should not be tight, but easy fitting.

The bandage should be worn next the skin and over it a flannel shirt. No undershirt is needed. A man can wear this bandage on a walk through the streets to his business, or he can walk around with it on in the park. It works quicker if he rides horseback with it on and bounces around in the saddle; or he can put it on and go to a gymnasium and bounce on a springboard. The object is to take some form of exercise which will move the whole body and make the stomach sweat. The flannel bandage absorbs the sweat. After the exercise it should be removed, and a cold bath should be taken. After the bath it is a good thing to rub the stomach and loins with alcohol to prevent the possibility of taking cold. The flannel bandage works well. It decreases the circumference of the waist. It takes off the fat from the places where a fat man wants the fat to be taken off most. To mention only one case, it reduced a man's waist one and a half inches in a three-days' ride.

SPRINGS of fresh water underlie most seas. About thirty have been discovered under the sea on the south of the Persian Gulf.

## THE SKIN.

THERE'S a skin without and 2 skin within,  
A covering skin and a lining skin;  
But the skin within is the skin without,  
Doubled inward and carried completely through-  
out.

The palate, the nostrils, the windpipe, and  
throat,  
Are all of them lined with the inner coat;  
Which through every part is made to extend,  
Lungs, liver, and bowels, from end to end.

The outside skin is a marvellous plan  
For excreting the dregs of men,  
While the inner extracts from the food and the  
air,  
What is needed the waste of the flesh to repair.

Too much brandy, whiskey, or gin  
Is apt to disorder the skin within;  
While if dirty and dry the skin without  
Refuses to let the sweat come out.

Good people all, have a care of your skin,  
Both that without and that within;  
To the first give plenty of water and soap;  
To the last little else but water, we hope.

But always be very particular where  
You get your water, your food, and your air,  
For if these be tainted, or rendered impure,  
It will have its effect on the blood, be sure.

The food which will ever for you be the best  
Is that you like most and soonest digest;  
All unripe fruit and decaying flesh  
Beware of, and fish that is not very fresh.

Your water, transparent and pure, as you think  
it,  
Had better be filtered and boiled ere you drink  
it,  
Unless you know surely that nothing unsound  
Can have got to it over or under the ground.

But of all things, the most I would have you  
beware,  
Is breathing the poison of *once-breathed* air;  
When in bed, whether at home, or out you may  
be,  
Always open the windows and let it go free.

All you who thus kindly take care of your skin,  
And attend to its wants both without and  
within,  
Need never of cholera feel any fears,  
And your skin may last you a hundred years.

—JOSEPH POWER.

## GLEANINGS.

[FROM VICTOR HUGO.]

ART for art's sake may be very fine, but art  
for progress is finer still. Ah! you must  
think? Then think of making man better.  
Let us devote ourselves to the good, to the true,  
to the just. Some pure lovers of art, moved  
by a solicitude which is not without its dignity,  
discard the formula, "Art for progress," the  
Beautiful-Useful, fearing lest the useful should  
deform the beautiful. They tremble to see the  
drudge's hand attached to the muse's arm.  
According to them, the ideal may become per-  
verted by too much contact with humanity.

They are in error. The useful, far from cir-  
cumscribing the sublime, enlarges it. The  
critics protest. To undertake the cure of social  
evils; to amend the codes; to impeach law in  
the court of right; to utter those hideous words,  
"penitentiary," "convict-keeper," "galley-  
slave," "girl of the town"; to inspect the  
police registers; to contract the business of  
dispensaries; to study the questions of wages  
and want of work; to taste the black bread of  
the poor; to seek labour for the working  
woman; to confront fashionable idleness with  
ragged sloth; to throw down the partition of  
ignorance; to open schools; to teach little  
children how to read; to attack shame, infamy,  
error, vice, crime, want of conscience; to  
preach the multiplication of spelling-books; to  
improve the food of intellects and hearts; to  
give meat and drink; to demand solutions for  
problems and shoes for naked feet—these things  
they declare are not the business of the azure.  
Art is the azure. Yes, art is the azure; but the  
azure from above, whence falls the ray which  
swells the wheat, yellows the maize, rounds the  
apple, gilds the orange, sweetens the grape.  
Again, I say, a further service is an added  
beauty.

## OUR OPEN COLUMN.

## CORRESPONDENTS' OPINIONS.

A REMARKABLE STORY OF TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.  
SIR,—I never was quite able to credit "White Cat's"  
story of how she compelled a boy of fifteen to wear  
stays and obey her in the most slavish manner, but I  
lately came across a case of somewhat the same  
nature.

I was in a country village for a holiday, where I  
made the acquaintance of an elderly maiden lady  
and her nephew. After the acquaintance had ripened,  
and we knew more of each other, the lady told me  
that she adopted the boy when he was about seven,  
that she found him a docile, quiet little fellow, and  
she, having a great objection to men through early  
disappointment, determined to bring him up at home,  
never to allow him to go to school, and to make more  
of a girl of him than a boy.

She dressed him in stays—but with a blouse and  
knickerbockers, not petticoats—and when he was a  
little over twelve she began to tighten his stays  
gradually. She had always laced rather tightly, and  
now, to encourage him to obtain a small waist, she  
used to make him lace her stays very tightly every  
day as she did his. In this way he began to take  
an interest in it, for he was devoted to his aunt, and  
to please her he used to tighten his stays even more  
than she ordered. By the time he was fifteen he had  
a figure like a girl, and, as he never went to school or  
associated with other boys, he was not afraid of  
ridicule, but was quite proud of his waist. He  
generally wore a loose blouse with a belt, but for  
evening wear he had a velvet jacket, open in front to  
show shirt and waistcoat, but shaped to the back  
quite tightly so as to show off the figure, of which  
the aunt was as proud as the boy—the white or black  
velvet waistcoat fitted accurately. Black velvet  
breeches, with black silk stockings and high-heeled  
patent leather shoes and lavender-coloured kid gloves  
completed his evening costume. When I first saw  
him in this attire, and with his light brown hair  
curled over his head and forehead, I thought he was  
a girl. His aunt had taught him to do needlework  
and wait upon her like a lady's maid. She had him  
taught to dress lady's hair by a coiffeur, and I  
noticed that her hair was most fashionably dressed  
and curled; she told me he was the best maid she  
ever had.

This eccentric lady is very rich and can amply  
provide for the boy, otherwise it would have been a  
very wicked thing to do, for, of course, the boy is  
utterly ruined for any manly occupation. He is  
musical, and plays fairly well on the piano and  
guitar. He is too tightly laced to play lawn tennis or  
take any exercise beyond a gentle walk, nor can he  
sing, and I have never seen a good singer who was  
tightly laced. He goes to bed every night with his hair  
in curl-papers, but does not sleep in stays. His aunt  
considers that quite unnecessary, and certainly aunt  
and nephew have very small waists without resorting  
to that plan. She told me she has his stays made  
for him by her London *corsetière*, who comes down on  
purpose to measure and fit him and her every six  
months. The stays are always of satin and trimmed  
with lace. She told him to bring me a pair to look at,  
and he fetched a beautiful little corset 17 in. in the  
waist, of very delicate, pale pink satin. He has them  
of all light colours—the aunt considers black satin to

be bourgeois, and will not let him wear them, but  
always white or quite light colour. They are made  
exactly the same as ladies stays, only without the  
fullness of the bust, well steeled and boned, with a  
straight busk and silk lace.

It is really a very curious case, and, I think, may  
interest some of your readers. He is in fair health,  
but looks delicate.—Yours faithfully,  
Kensington, Sept. 23, 1893. ALICE.

## Notes &amp; Queries

This column is specially devoted to subscribers who are  
desirous of obtaining information on any practical  
subject, whether Domestic, Medical, Sanitary, or  
otherwise. The Editor suggests that Correspondents  
should express their wishes in as brief a manner as  
possible.

All letters should have the words "NOTES AND  
QUERIES" on the envelope.

## QUESTIONS.

QUOTATION.—"Death is better than life." The other day I  
came across this sentence as a quotation. Will some reader  
kindly inform me where it is to be found? I felt sure that it  
was in the Bible, but, with the assistance of a concordance, I  
cannot find it there.—ROB.

TIGHT-LACING.—Having seen a great deal of correspondence  
in your valuable paper on tight-lacing by men, and being a  
believer of the same, I should be glad if you would insert this  
in order that I may get in correspondence with some of your  
readers, as I wish to have practical advice on the same. I have  
been a corset wearer for some time past, and am also as I see  
some of your correspondents a believer in female attire. I  
should be glad to answer any letters addressed to "Gerald,"  
Southampton. To be left at the post office till called for.

TURKISH BATHS.—Having been advised to take these baths  
occasionally, would some kind reader who has personal experi-  
ence of them describe the best way of taking them in order to  
obtain the greatest benefit? What I want to know is, in what  
order should the different rooms be taken, and hints as to  
drinking water, pouring water over head and body before  
shampooing, &c. I notice some bathers take the coolest rooms  
first, others the hottest; and some drink if you would insert this  
in order that I may get in correspondence with some of your  
readers, as I wish to have practical advice on the same. I have  
been a corset wearer for some time past, and am also as I see  
some of your correspondents a believer in female attire. I  
should be glad to answer any letters addressed to "Gerald,"  
Southampton. To be left at the post office till called for.

leaving the cooling room, he would much oblige.—NOVICE.

## ANSWERS.

HAVING seen "Phelps'" request in your paper of last week  
for a description of three or four nice, healthy, old-fashioned  
villages, where rents of furnished rooms and living are cheap,  
I beg to say that I have been staying down here for some little  
time, find the air dry, bracing, and healthy. The rooms  
cheap and everything most comfortable, family consists of  
husband, wife, son, and daughter, all of whom I have found  
most kind and attentive. Gallywood is three miles from  
Chelmsford, but a pony and trap is kept to convey anyone from  
the station. I can safely recommend this place, and think it  
would meet "Phelps'" requirements, and that he would be  
very comfortable here. For terms and all particulars, apply  
here to Mrs. Burrell, Gallywood Common, Chelmsford, Essex.

ANSWERS  
-TO-  
CORRESPONDENTS.

Correspondents will in every case be answered as early  
as space and time will permit.

It is particularly requested that all communications  
may be distinctly written and concisely expressed, and  
marked "ADVICE GRATIS" over the address on the  
envelope.

All communications should be addressed to the EDITOR  
of the FAMILY DOCTOR, 13, Catherine-street Strand,  
London, W.C.

Just published, 1s., post free 1s. 1d.

THE PHYSICIAN. A Family Medical Guide. Contain-  
ing upwards of 250 Recipes for the prevention, treat-  
ment and cure of nearly all the ills incidental to the human  
frame, with advice to the healthy, rules for the sick, tables  
on digestion, &c. Also a Treatise on Consumption. By  
Eminent Physicians. Carefully copied from the prescription  
book of a London Chemist. Thirty years' experience.  
Offices—13, Catherine Street, Strand, London, W.C.

THE CURE OF  
CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, & CATARRH.  
By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S.,  
Late M.R.C.S. Eng., late Consulting Surgeon to the  
Lower Clapton Orphan Asylum, &c., Lynton House,  
Highbury Quadrant, London, N.

By the success of this discovery all barriers have  
been broken down, and it is now an acknowledged fact  
that CONSUMPTION, BRONCHITIS, and ASTHMA ARE  
CURABLE by this treatment. MANY THOUSANDS of  
cases, abandoned as hopeless, have been SUCCESS-  
FULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success  
of your treatment of Consumption is simply marvellous,  
I had no less than 60 cases of cure last year."

## HUDSON'S EXTRACT OF SOAP

AND  
HUDSON'S DRY SOAP.

## RECOMMENDED

For the preservation of lawns, laces, beautiful washing  
fabrics, underwear, fine linen, shirts, sheets, &c.,  
HUDSON'S EXTRACT OF SOAP and HUDSON'S  
DRY SOAP are recommended. Instead of the offensive  
soapy smell common in many Soaps, HUDSON'S  
leaves the linen actually sweeter and fresher than  
when new.

## FAILING EYESIGHT

Persons suffering from Defective Vision (particularly those  
who have been unable to get suitable glasses elsewhere), should  
consult Mr. Bluet, who has had thirty years' practical  
experience in making and adapting Spectacles for every form  
of Defective Eyesight, and for which he has received numerous  
unqualified testimonials.

The Eyes Carefully Examined and Sight Tested FREE.  
Spectacles from 1s. 6d. per pair.

F. BLUETT, Specialist in Spectacles,  
8A, GREAT PORTLAND STREET, W.  
[FOUR DOORS FROM OXFORD STREET.]

# DISINFECTION.

Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

### The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:

King's College Hospital.	Nazareth House, Ham-
University College Hos-	mersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

VERY UNHAPPY.—You have been wise to give up such a depressing habit before the consequences have become too serious. Make up your mind never to give way to it again. We have frequently advised our correspondents as to the methods of preventing the losses, but we repeat once more: Do not drink after eight p.m. Take no late supper. Sleep always on one side or the other—never on the back. Rise to empty the bladder directly you wake, whether once or oftener during the night; do not read exciting or unhealthy literature. Take as much outdoor exercise as possible. The following medicine night and morning will help you: Tincture of perchloride of iron fifteen drops, bromide of potassium twenty grains, sulphate of magnesia half a drachm, spirit of chloroform five minims, water to half an ounce.

ANXIOUS.—Why don't you tell us whether you are a man or woman? How old you are? What your occupation, habits, diet &c? If a woman are you regularly unwell? Are you married? When you have answered these queries as well as any information you can give us about the bowels, exercise &c., we shall be happy to tell you both the cause, and the treatment of the trouble which is causing you so much anxiety.

COPERNICUS.—1. It is not at all unusual to find in the elder children in a family, where the parents have married early (i.e. before twenty-five or twenty-six), that the teeth begin to fall soon. To that extent your first supposition is correct, inasmuch as full osseous development is not attained until the age named, and it is possible the father may, to a corresponding extent, be deficient in the calcareous matter needed for the development of sound teeth. 2. Connection with such a family would not be favoured by the circumstances, but on the other hand we do not think that poorly developed teeth should be any bar to matrimony. 3. Children resulting from such unions need not necessarily be weak of limb or otherwise unsound, granted that the other parent were sound.

OLGA (London).—You have not stated what English surgeons you have consulted—with the exception of one, who is good, but not in the first rank. Our advice to you would be to see some really first-rate man, endeavour to ascertain the exact nature of the growth, and be guided by him, though we should not advocate a cutting operation for removal. Another thing you wish to know is whether the discharge has any relation to the tumour or is quite independent of it. You had better let us know what surgeons in England you have seen, and send a stamped addressed envelope, that we may recommend one we may think suitable.

CHLORIC.—There is no harm in your smoking and drinking in moderation. The powder we generally recommend is: Borax, chloride of sodium, and bicarbonate of soda, of each, seven grains, powdered white sugar fifteen grains. Dissolve this in a half tumblerful of warm water, and inject into the nostrils, bringing it out of the mouth. If there is any hypertrophy of the mucous membrane, this may require cauterisation. We should think that it would therefore be better for you to consult a specialist about this matter, because it may be the sole cause of your catarrh, and, if left untouched, the catarrh will, of course, go uncurd.

GRANULATED.—She had better go to some hospital where she can get them properly treated. The treatment of this condition requires superintendence, hence we do not care to take the responsibility. As we do not know where you live, we cannot advise you to whom to go. Nor are we permitted to mention names in these columns.

SENSITIVE.—In treating a malady of this sort, it is necessary to find out what physical disturbance, if any, is at the bottom of it. There surely must be something to see or feel if you have such discomfort. You say you have seen a doctor, did he not tell you what it was? We should advise also to use plenty of soap and water to it, and to rub it hard with a rough towel. You do not state what your age is, nor what your occupation; you had better keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Take a teaspoonful of Parrieh's Food three times a day immediately after meals.

A TROUBLED ONE.—You are suffering from hyperaesthesia of the parts, which only local treatment will remove. You might take all the medicines known to the pharmacist without deriving any benefit.

**WANTED.**  
5,000,000

MOTHERS, to insist on having their Babies' Toys and Feeding Bottles fitted with INGRAM'S NEW PATENT COLLAR or RIM TEAT. They do not in the slightest degree irritate the most sensitive Gums, but, on the contrary, they have been proved to be the Best Soothing Teat ever invented. No

### BROKEN

Rest for Mothers or Nurses, and Father can now have the luxury of his evening paper in peace—without being constantly disturbed by the cries from the cradle; in fact, the whole home is changed to a haven of bliss through the introduction of INGRAM'S PATENT COLLAR or RIM TEAT, No 22,458 on every Teat, and if the

### FEEDING BOTTLES

now in use are not fitted with this wonderful invention, a loose Teat can always be bought for a few coppers at your nearest Chemist.

A YOUNG WIFE.—You do not describe any signs of pregnancy with the exception of cessation of the menses. As you have previously gone several months without any sign, we do not think we can give you a definite opinion on the matter. What is it you really want to know? If there were any other symptoms, such as morning sickness, &c., we shall be happy to give you an opinion.

XXX.—Sea salt will be useless in such a case. Try the following lotion instead: Sulphate of zinc twenty-four grains, compound tincture of lavender six drachms, distilled water to six ounces. To be used with a syringe twice a day; the wound subsequently to be dressed with lint, and the lotion, and out just large enough to fill the opening of the sore; this to be covered with oiled silk of slightly larger size. Take the following mixture each morning before rising: Sulphate of magnesia one drachm, carbonate of magnesia ten grains, nitrate of potash five grains, peppermint water to half an ounce.

BAND LAD.—1. Bathe them with sea salt and cold water twice a day. Take plenty of walking exercise, rub them well afterwards with a Turkey towel. 2. Keep the bowels acting freely. Use only hot water to wash the face, with the addition of vinolia soap, and take a pill containing one-tenth grain of sulphate of calcium, three times daily with meals. Rub the face well with the towel after washing.

NERVOUS.—This is merely a question of habit, not disease. You should check this constant desire, otherwise it will get the mastery of you, and you will become a perfect martyr to it. You need fear no harm from checking the tendency, no harm will come of it. Unless you do so, however, the bladder will become diseased, contracted, and hypertrophied, and you will require special treatment to have it cured or alleviated. The mere fact of micturating is not likely to cause nervousness or depression, take a teaspoonful of Parrieh's Food three times a day immediately after meals.

J. J. F.—You were wrong to marry under the circumstances. However, you must learn to pass a bougie (No. 9 English) twice a week (the chemist will tell you how to use the instrument), and take the following mixture: Bromide of potassium twenty grains, tincture of nux vomica ten minims, sulphate of magnesia twenty grains, water to half an ounce. Take this three times a day for a month, during which time you must abstain; then write us again.

A CONSTANT READER.—See the medicine ordered "J. J. F." in these columns. Take it regularly for six weeks, and in addition the following pill daily with dinner: Pill of colocynth and henbane two grains, compound rhubarb pill two grains, blue pill half a grain, eucalyptin half a grain. Drink a glass of cold water (by glass) each morning on rising, and if possible take a cold bath each day.

DON CARLOS.—These are only analogous to the blackheads that people get on their faces. The continual use of plenty of soap and water regularly will soon eradicate the trouble. Keep the bowels freely open, and take plenty of active outdoor exercise.

A CROOK'S DAUGHTER.—We should advise you to take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one and a half drachms, infusion of gentian to six ounces. One-sixth part three times a day. This will prevent the feeling of gnawing and emptiness of which you complain. No further medicine is necessary; it would be as well to take a grain or two of blue pill occasionally at bedtime to keep the liver acting.

NEMO.—Your letter confirms our previous supposition. You do not take enough animal food, nor as far as we can see any fish at all. Make up these deficiencies as far as possible; if necessary even to the exclusion of the beer. An occasional cup of port will do you good, and we have no objection to the milk at night. Take one teaspoonful of sulphate of soda dissolved in water, night and morning.

J. H. B.—The prescription was tentative, and it would be absurd to expect complete recovery in so short a time. Please continue the medicines for another fortnight, and if you are then not better, you will do wisely to consult a specialist physician on the matter. We shall be happy to give you a recommendation to one if you desire it.

BILL.—We are unable to tell what this phlegm is like or where it comes from without a personal examination. You say you suffer from indigestion. This may be the cause of your light weight, excretion, &c. At your height, and a singer, too, you ought to weigh and measure much more. You had better see some medical man, and get yourself thoroughly examined, so as to ascertain the exact cause and condition of your chest and other parts.

ELIRA.—You need say nothing about the matter at all, there being no necessity. Under any circumstances we should hope you would be on sufficiently good terms with your future to be able to enter into any explanation.

## Signs of Health.

You don't have to look twice to detect them—bright eyes, bright color, bright smiles, bright in every action.

Disease is overcome only when weak tissue is replaced by the healthy kind. Scott's Emulsion of cod liver oil effects cure by building up sound flesh. It is agreeable to taste and easy of assimilation.

Prepared by Scott & Bowne, Ltd., London.

Sold by All Chemists and Vendors of Medicine at 2/6 and 4/6.

"The FAMILY DOCTOR conveys to its readers much Useful Information."—*The Graphic*.

## WHAT PEDDLER IS THIS?

TO people who live remote from shops the peddler is a useful man, whether he goes about in a waggon or on foot with a pack on his back. But in England nowadays villages are so thick and shops so plentiful that the peddler's field is not what it used to be. So if these men want to keep on selling goods they will have to locate elsewhere presently.

There is one peddler, however, who will never stop going about. The day he does the community will suffer greater deprivation than if all the local tradesmen should shut up shop at once, and never open again. Everybody buys of him, yet no human eyes have ever seen him on his rounds. Year in and year out, in all seasons and weathers, he attends to business. People can refuse to deal with other peddlers and no harm done (perhaps money saved), but when they refuse to deal with him they die. Yet he is no murderer. "Who is he? who is he?" you cry. Wait a bit till we introduce him. Ah, yes; he has wonderful power. Even when folks fail to treat him well they fall ill, worse than if a witch had cast the "evil eye" on them. And sooner or later every soul of us runs this risk.

Mr. Alexander McCreary, of Dam Head Crossing, near Moira, Co. Down, Ireland, was taken ill in June, 1890. It was nothing that he could account for. He simply felt weak, at first. There was a foul taste in his mouth, and when he sat down to his meals he couldn't eat a thing; that is, not with a relish. And when he fairly forced himself to swallow something, it went against him, as though it were some nasty stuff from a drain. And that wasn't the worst of it; right away afterwards he had pain in his chest and stomach. Then his hands and feet grew cold and clammy, "as if," he says, "my blood had some malignant thing floating in it."

Soon Mr. McCreary found the kidney secretion scanty and hard to pass. His sleep was broken and unrefreshing. Thus he gradually weakened and wasted until he could barely drag himself along. All unknowingly, yet all the same, he had offended the mysterious peddler.

Mrs. Sarah Williams, of Lower House, Rhos-common, Llandrinio, near Oswestry, fell ill in like manner in December, 1891. She, too, lost her appetite, and got into a queer, nervous condition. Indeed, she felt so irritable she

couldn't bear the least noise, or any one near her. Then she found it difficult to breathe. At times she was so bad this way that she gasped for breath, and was afraid she was about to die. When in bed she had to be propped up to keep from suffocating. As the weeks went by she lost strength more and more. She consulted a doctor, and spent pounds for physic without obtaining relief. Four months the lady suffered as we describe. Both she and Mr. McCreary got well again, but that is another part of the story. She, too, all unwittingly and unintentionally, had offended the strange peddler.

"Who is he—who is he?" you shout. His name is Blood, and he travels through the country called the human body unceasingly from the hour of our birth to the hour of our death. He carries all things that are wanted by all parts; by the muscles, by the brain, by the skin, by the liver, by the kidneys, by the lungs, and by every other part, no matter how small or obscure. And more than this he does. He carries away everything we are done with; everything that is worn out, and in the way. He gives new things for old, does this wonderful peddler, and asks nothing to boot. But he will not stand any interference with his business. When you compel him to distribute things not in his line, he doesn't refuse; he distributes them and makes you pay with your health, and often your life. You had better pull the ears of a hungry lion than offend this benevolent, kindly peddler.

How can you offend him? This way. Conduct yourself so as to contract the disease called *indigestion and dyspepsia*, which fills the stomach with poisons. These deadly poisons are loaded on to the Blood, which carries them to every part, just as he carries food. Only now he scatters pain, misery, suffering, death. Do you see?

That is what these two people—like millions more—did, and are all the time doing. They were saved at last by using Mother Seigel's Curative Syrup, which relieves the Blood of his terrible load, throws it from the body's windows, and saves health and life. The letters from which we quote are duly signed by the persons we have named.

When you think you have offended Peddler Blood, ask Mother Seigel to help you to a reconciliation. Then be more careful.

### THE PATENT MASTICATOR 16 Blades in One.

TO USE IN PLACE OF KNIFE. For preparing Meats and other Food for mastication by mining and pulping same on your warm plate, and so preserving all the nutriment. Invaluable to the AGED, YOUNG CHILDREN, and all suffering from WEAK DIGESTIVE ORGANS or DEFECTIVE TEETH.

"FAMILY DOCTOR" PUBLISHING CO.  
18, CATHERINE ST., STRAND, W.C.

"The FAMILY DOCTOR is a Popular Periodical, and contains many useful Notes."—Morning Post.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scurfs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

## EDITORIALS.

**THE TEETH.**—A frequent cause of indigestion is partially masticated food; this is often the result of bad teeth. Now, good or bad teeth are an inheritance undoubtedly, but it is equally true that teeth degenerate through improper food imperfectly masticated, and they can be nourished through proper aliments and thorough mastication. The enamel of a tooth is composed chiefly of lime, and is very hard. Hot or cold drinks are liable to injure it, and anything acid or sour corrodes or softens it, sometimes to the final destruction of the whole tooth. It is necessary that the teeth should be cleansed twice a day, the best times being after breakfast and after dinner, as then all foreign substances can be dislodged easily, and the interstices can be penetrated by the brushes, of which there ought always to be two—the bristle brush to use for the cleaning process, and an india-rubber one for the polishing. First use the bristle brush with antiseptic (or charcoal) tooth-powder, and thoroughly brush the teeth; then take the rubber-brush and cold water, and brush lightly and briskly. This polishes the teeth like ivory, and sweetens the breath also.

**SNORING** is not confined to sleep; persons with some forms of nasal catarrh snore continually. But a healthy man snores, as a rule, only when asleep, because then he does not control himself. He gets into some position with his mouth open and inhales through his mouth. If the mouth were shut he would not snore.

THE action of the human heart is sufficiently strong to lift every twenty-four hours 120 pounds.

It has been computed that the average growth of the finger-nail is about one-thirty-second of an inch per week.

TOWLE'S PENNYROYAL AND STERIL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 1½d. and 2s. 9d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 15 or 34 stamps by the Maker, R. T. TOWLE, Chemist Nottingham. Beware of imitations, injurious and worthless.

PERSONS who are inclined to submit themselves to the "mesmerising" which is now one of the amusements of social gatherings would do well first to consult a competent physician. If there is the slightest derangement of the heart there is serious danger of the sudden collapse of that rather important organ under the very peculiar influence of the mesmerising process.

PERSONS suffering from cold in the head will secure some relief by using glycerine. They should obtain a camel's-hair brush, medium size, of the druggist, and with this paint the nostrils with glycerine as far back in the passage as possible.

WHEN there are symptoms of a ringworm, wash the sore member three or four times daily in a strong solution of borax, then dust over the fine powder.

CONTAGIOUS DISEASES.—Individual resistance to contagion is most remarkable. A physician or nurse will be brought into the most intimate contact with a case of contagious disease without contracting it, while the same patient may communicate it to a person passing him in the street, in the early stages of his trouble, before it has developed sufficiently to cause any alarm. We have known of a most malignant attack of diphtheria, communicated to a chemist by a person calling at his shop before the disease had fully declared itself; and a lady suffering from the mumps succeeded in communicating them to a sympathising neighbour who stopped for a moment at the door to inquire after her health, while other members of the family residing in the same house remained unaffected.

SHAPES OF EGGS.—Various attempts have been made to account for the diversity in shape seen in eggs. A recent study convinces Dr. Nicolsky that the differences may be all traced to gravity, and he finds his idea confirmed by all the eggs in the zoological collection of the St. Petersburg University. He supposes that pressure by the sides of the ovary tends to elongate the egg before the shell has hardened. In birds which keep a vertical position while at rest, as do the falcon and the owl, the soft egg is made short by the action of the weight of the body against the ovarian pressure; while in birds that, like the grebe, are nearly always swimming, the egg is lengthened because the bird's weight acts with the compression by the ovary. The egg is made more pointed at one end than at the other in birds that—like the guillemot—are frequently changing their position, sometimes swimming and diving, sometimes perching on the rocks, &c.

WASHING FRUIT BEFORE EATING IT.—The following curious instance is reported by M. Schnirer of the ease with which consumption germs may be disseminated. While at work one day in the laboratory of Weichselbaum he sent for some grapes to eat. The fruit had been kept for some time in a basket outside the lavatory, and was covered with dust, so that the water in which it was washed was black. On examining it he reflected that, inasmuch as the neighbouring street was traversed by consumptive patients going to the clinic, the dust probably was charged with tubercle bacilli. To settle this M. Schnirer injected into three guinea pigs ten cub. centim. of the water in which the grapes had been washed. One animal died in two days from peritonitis, the two others died on the forty-eighth and fifty-eighth days respectively, presenting marked tuberculous lesions, especially at the place of injection. The water in which the grapes had been washed was taken from the faucet, and the glass containing it had been sterilised; neither the boy who had bought the grapes nor the merchant who had sold them were consumptive. The cause of infection was, beyond doubt, the dust on the grapes. This experiment illustrates the danger arising from the dissemination of desiccated tuberculous sputa in the air.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

TO CHECK A SNEEZE.—It is not usually supposed that any exercise of the will-power can be made efficient in checking a cough or a sneeze; but Dr. Brown-Sequard, in one of his lectures, says of the subject: "Coughing can be stopped by pressing on the nerves of the lips in the neighbourhood of the nose. Sneezing may be stopped by the same mechanism. Pressing in the neighbourhood of the ear, right in front of the ear, may stop coughing. It is so also of hiccoughing, but much less so than for sneezing or coughing. Pressing very hard on the top of the mouth is also a means of stopping coughing, and many say the will has immense power. There are many other affections associated with breathing which can be stopped by the same mechanism that stops the heart's action. In spasm of the glottis, which is a terrible thing in children, and also in whooping-cough, it is possible to afford relief by throwing cold water on the feet, or by tickling the soles of the feet, which produces laughter, and at the same time goes to the matter that is producing the spasm and arrests it almost at once. I would not say that we can always prevent cough by our will; but in many instances these things are possible, and if you remember that in bronchitis and pneumonia, or any acute affection of the lungs, hacking or coughing greatly increases the trouble at times, you can easily see how important it is for the patient to try to avoid coughing as best he can."

## PROFESSION OF MOTHERHOOD.

AT a time when pressure on professions is severe, and when women are squeezing into them at such a rate that the earning of a livelihood is a matter of no small difficulty to the poor male, it is impossible to disguise our interest in the news that the ladies have discovered a profession which they can have all to themselves. Few amusements are more innocent than that of rediscovering old truths, and Miss Marion Harland, in writing her recent article in the *North American Review*, must not only have experienced the delight of knowing that she had produced and could claim maternal rights over a most charming headline, but may also have felt some satisfaction in the knowledge that the dogma she was about to unfold for the delectation of an astonished world had already in bygone ages received the sanction of most respectable people, for although it may be news to some, it still remains a fact, well emphasised in old world history, that the profession of motherhood has always been the sole profession of the best of women. It is, however, with a chastened sense of satisfaction that we find a notion so antique receiving even such support as a magazine article from the land of progress. To administer, says Miss Harland, the affairs of a household, upon the integrity of which depends the health, comfort, and happiness of those who are to make history when their progenitors are with the forgotten dead, is a profession in itself, and an important one. Motherhood and home-making are women's untransferable missions. Men may write her books, or paint her pictures, or conduct her financial and benevolent enterprises so well as to leave her generation nothing to regret in her withdrawal from one or all of these scenes of action. If she shirks the duty of maternity, the whole creation cannot supply a substitute. Those of us who remember the meeting of the British Medical Association at Brighton, not so many years ago, at which the president, Dr. Withers Moore, ventured to suggest to womanhood at large that to become mothers of men was not, after all, a too ignoble mission, and who recall the howl of disgust and scorn with which the hateful proposition was received, may perhaps now gently laugh at the swing of the pendulum while congratulating the race on the happy news that its perpetuation is now to be recognised as the proper sphere of woman-kind, a little fact which, it may be hinted, the best of them, the sly creatures, have known and acted on all along."—*British Medical Journal*.

TO TOBACCONISTS (commencing).—*Illust. Guide*, 250 pages, "Post Free." How to Commence, £20 to £1000, Tobaccoist's Outfitting Co., 186, Euston Rd., London. Manager, H. V. Myers. Est. 1888. Smoke "Pick-Me-Up Cigarettes."

"The FAMILY DOCTOR conveys to its readers much Useful Information."—*The Graphic*.

[SPECIAL ARTICLE.]

**DOMESTIC SURGERY.****USEFUL FOR THE HOUSEWIFE.**

Written and Illustrated by a SURGEON.

(See Frontispiece.)

**ESMARCH'S TRIANGULAR BANDAGE.**

It is not always convenient to use a roller bandage, even if they are ready to hand, for the simple reason that in many cases of accident the wounds or injuries can only be temporarily dressed, and then it would be irksome and inconvenient to the surgeon and patient to have a lengthy unwinding to undergo before exposing the injured surface. For this reason we give here a few drawings of the most ready and useful applications as yet invented, and perhaps the very simplest either for fixing, dressing, or protecting any part by support.

It is merely a triangular piece of calico—unbleached, and well washed—cut in the shape of half a handkerchief—indeed, a large cotton handkerchief folded cornerwise will do almost as well, excepting that it is hardly large enough for some purposes.

Esmarch's bandage is four feet along the bottom from end to end, and about three feet, or a trifle under, from the point or top of the pyramid to the ends, or base.

In describing its use we shall speak of the point and ends and base.

When not in use the bandage should be folded down the centre, placing the two ends together. Then the ends and the point should be doubled over to the centre of the base—where the first fold is—and thus a square will be formed. This may be folded again and again till it is about the size of a folded pocket handkerchief.

For use it may be folded broad or narrow, according to circumstances. Having spread out the bandage, commence by carrying the point over to the centre of the base; and still working from the direction of the point, when it is required broad, fold it twice, and when narrow, three times.

The bandage is fastened either by pinning the ends together or by knotting them. The sailor's or reef knot should always be used in preference to what is termed the "granny," as it is less likely to slip.

Fig. 16.—A. THE "GRANNY'S" KNOT.  
B. THE REEF KNOT.

Before applying bandages all blood and dirt should be carefully washed from the wound, and the hair cut away when necessary. Then a piece of doubled lint dipped in water and placed over the wound, and the triangular bandage applied as follows:—

**Wound of the Scalp.**—Place the middle of the bandage on the head—so that the base lies crosswise before the forehead—the point hanging downwards over the nape of the neck. Carry the two ends backwards above the ears, cross them at the back of the head, bring forward again, and tie over the forehead.

Now stretch the point downwards—it being under the bandage—and turn it up over the back of the head, and fasten it on top with a safety pin. See Fig. 18.

**Wound on the forehead, side, or back of the Head.**—Fold the bandage narrow, and then lay its centre over the wound, carrying the ends backwards; tie at the opposite side of the head. If the bandage be long enough the ends may be crossed at the side opposite to the wound, and carried forward again to be tied.

Fig. 22.—FOUR-CORNERED HANDKERCHIEF BANDAGE FOR TOP OF SCALP.

**Wound of the Jaw or side of the Face.**—Fold the bandage narrow, place the centre under the chin, carry the ends upwards one at each side, and tie on the top of the head.

**Wound of the Eye or front of the Face.**—Apply the bandage in a similar manner as for the last.

And for the neck, as in Fig. 21.

Fig. 23.—FOUR-CORNERED HANDKERCHIEF BANDAGE FOR BACK OF HEAD.

The Figs. 22 and 23 explain themselves—the method of applying the four-cornered handkerchief bandage.

In our next number we shall describe the methods of applying the triangular bandage to wounds of the limbs and extremities and other parts of the body.

As some of our readers state that they cannot exactly understand the manipulation of Fig. 11 in our number of September 16th, we have appended this supplementary drawing in the hope that they may come to a better knowledge of the application of one of the most useful bandages employed in surgery.

Fig. 11A.—THE CAPITELLA BANDAGE.

**AFTER THE HOLIDAYS.**

THE holiday fever is passing off. Deference is setting in rather quickly and the temperature threatens to fall considerably below normal. This post-holiday stage of life, says the *Lancet*, seems to us to be entitled to a little more attention than it has received. It is often acute and disagreeable, so much so that the victim of it is apt to think that there is no other cure for it but "a hair of the dog that bit him"—another holiday, to be followed by the same depression, this in its turn necessitating further change, till a habit of restlessness in life is generated and people begin to feel never at home save when they are from home. This is a veritable evil that should be boldly met by resolute domestication and the cultivation of home employments and pleasures. A very little reflection will make this easy. There are innumerable advantages to be found at home and nowhere else. Moreover, the everlasting sense of movement and noise which is associated with railway travelling, pleasure resorts, and hotels is a very disturbing influence even to the most philosophical traveller, and the very mountains and rivers are apt to be used wrongly and injuriously by holiday-makers. We have no wish to encourage any morbid reflections. Those who have enjoyed their holidays must bear patiently with the mood which is apt to assert itself for a week or two subsequently. The reaction is in proportion to the pleasure—

"So high as we have mounted in delight,  
In our dejection do we sink as low."

Nature, however, will restore the equilibrium, and the outcome of well-spent and well-enjoyed holidays should be to furnish us with fresh resolves to meet quietly the duties of life as they arise.

"ANY DOCTOR WILL TELL YOU" there is no better Cough Medicine than KEATING'S LOZENGES. One gives relief; if you suffer from cough try them but once; they will cure, and they will not injure your health; they contain only the purest and simplest drugs, skillfully combined. Sold everywhere in 134d. tins.—[ADVT.]

## SIGNS OF PROMISE.

By MRS. M. D. STRONG.

ONE is not necessarily a pessimist because he takes rather low views of some situations in life. I belong to that growing class which believes that the best things are ahead of us, and not in that halo region called the past, in which most things lying back of us become, in time, glorified. And yet I confess to many misgivings in view of some conditions that confront me, one of which is the bondage of woman to the rule of fashion, the zeal, the painstaking effort which I observe on the part of a large class of women in adopting every new departure in dress, manner of living, and entertaining that in some inexplicable manner is decreed to be the "latest style."

And yet there are signs of promise not to be mistaken, indications, I am sure, of progress toward a better day. One of these lies in the present divided state of public opinion as to the revival of the always ridiculous fashion of hoops. While hoops may be eagerly adopted by the majority—though of this I have serious doubts—the fact that a minority among our best women declares its position against them, shows progress toward that larger freedom in matters of dress which we believe will ultimately prevail, gives a hint of that Golden Age—let us call it—in which every woman, in all the manifold expression of her life, shall be herself, and not a poor copy of someone else.

I sat in church one day behind a young girl whose waist was most painfully girded in. Her constant movements betrayed the discomfort which she suffered, and the creaking of her corset revealed the source of her torture. Her bell skirt was of the tightest, her under garments apparently of the scantiest, and all the accessories of her toilet were in keeping with the most rigorous demand of the fashion of the day. I watched her contortions with pity, in view of the years of suffering which such barbarism in dress must surely entail, should years happen to be granted to one who so despised her birthright of health and strength and privilege. And yet when that girl turned at the close of the service, lo and behold! in these days of multiplied abominations in hair-dressing, her brown hair was smoothly parted above her pretty forehead, and a pair of soft eyes looked up honestly into mine. I have hope for that unknown girl. She may yet discover the charm, the beauty, of simple, easy-fitting garments. And let us hope also that the outrage upon moral as well as physical law, of which she and ten thousand such as she are guilty, may be in some way revealed to her.

At my table sits a genial, attractive, much-travelled woman, this side of the forties. Imagine my surprise on hearing this devotee of fashion and fad declare one day, "I will not wear a train."

And, sure enough, her elegant dresses were all made walking length, and this in a day when nine out of ten women felt compelled to drag their skirts through the dust and filth of our streets. I have great hope for this woman also. This streak of sense indicates that she may yet come to herself along other lines, that she may discover the elegance of simplicity, and the fitness of times and seasons in matters of dress.

A few days since I was invited to dine at the house of a gentleman of large wealth, a comparative stranger to me personally, but one well known for his generous gifts to educational and philanthropic causes. I rather dreaded the ordeal of that dinner, for I am not rich myself, and have frequently broken bread with my friends who are rich, and have not always enjoyed their hospitality; for oftener than otherwise that which has gone by that name has been a rather tiresome exhibition of elaborate table service and furnishings. But the day came, and the carriage, with coachman, was sent to convey me to the beautiful home of

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, LINCOLN.

my host, and as we rolled along my mind was busy making itself up to be a well-behaved martyr for the next two or three hours. But the martyrdom was all of my own making.

In response to my ring the servant opened the door with a smile of welcome, and a step or two within the hall she sweet-faced hostess met me with quiet cordiality. A little further on the host took my hand as though he found genuine pleasure in greeting a new friend.

For a half hour we sat talking, and came into something like real fellowship before the dinner was announced.

The dining-room was a pleasant, home-like apartment; the table was perfect in its appointments of fine linen, costly china, solid silver, cut glass, and exquisite roses. The dinner was elegantly served, but the conversation flowed on in the most hearty, natural, and spontaneous fashion, and the rich belongings and helpful, unobtrusive service took second place. Not once during the meal was I reminded that this was an exhibition, but every moment my host and hostess were superior to their cut glass and silver. It was a charming home, and my visit was a genuine help to me from coming into touch with a high-minded man and woman. When I took my seat in the carriage for the return home, it was with a little song in my heart over what had come to me, and something akin to a prayer on my lips that all wealthy people—and those not wealthy as well—might know what hospitality—sweet, genuine, and helpful—is.

A large place of influence and usefulness is waiting for every woman who shall judge for herself in matters of dress, whose entertainments shall be illustrations of that which is best in herself, of her own thinking and living, and not a vulgar display of the "things" which she possesses; whose hospitality shall not exhaust itself on "lunches" and "teas," leaving out that fine giving of one's self which is ever and always the highest and best gift. All honour to the woman, queen in her own right, be she rich or poor, who has come into this high estate.

We who are burdened by the constant pressure of life as it relates to non-essentials, need to encourage ourselves with the indications seen on every hand that not women only, but the world in general, is throwing off the bondage to "elaborate trivialities," and bear in mind that the day of simplicity and honest living is beginning to dawn.

## LIFE.

DESCRIBE me life. A blossom'd thorn,  
A poppy waving in the corn,  
Waiting the silent reaper's thrust,  
A bubble's shadow, dreams, and dust.

Give me some other similes.  
The thistle-down before the breeze,  
A leaf, a flower, a bead of dew,  
A gossamer—what more would you?

Your fancy's fertile—try again.  
'Tis a steed bounding on the plain,  
'Tis a sail scudding from the strand,  
A bird, a wave, a drift of sand.

Can you no other symbols find?  
A cadence wafted on the wind,  
The fitful breathing of a shell,  
The echo of a plaintive bell.

—HENRY SEWELL STOKES.

## RECENT PATENTS.

This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.

- 17,647. Obstetrical and examination stirrup. J. M. MAURER, London. September 18th.
- 17,665. Howard's universal herb medicine. J. HOWARD, Cork. September 20th.
- 17,771. An improved instrument for removing foreign matter from the teeth. F. J. BENNETT, London. September 21st.
- 17,782. Portable apparatus for treating a patient with a medicated or tempered atmosphere. A. CAZAUZ, London. September 21st.
- SPECIFICATIONS PUBLISHED.
- 4,175. ABBOTT. Vaccination shield (10d.), 1893.
- 7,133. JONES. Suspensory bandage (10d.), 1893.
- 14,770. NAPIER. Curing gout, &c. (10d.), 1893.

## A VERY RARE CENTENARIAN.

DR. WIELOBYCKI

IT is not very long since we were lamenting over the pathetic disappearance of Old Parr from the number of those who hold out to the men and women of this generation such bright promises of continued health and a long and happy life. It is new names that are to-day familiar in our mouths as household words. But when those of us were young that are now getting into the sere and yellow leaf, Old Parr was still an inspiring memory, and his pills were a force in the world of patent medicine. For had he not lived to an almost fabulous age, and in quite modern times, too? Was it not a hundred and fifty years that he had reached? Or did the score run even higher than that? And if he attained to that more than patriarchal age chiefly by means of his pills, what might not we have done if we only had his advantages? But we fear that the secret of his longevity has disappeared from the face of the earth; and to compensate for it we have only, at long intervals, the experience of a very rare centenarian like Severin Wielobycki, who died at his residence in St. John's Wood on September 7th, having reached the great age of one hundred years and eight months.

Would it be possible to get the secret and to practise it in our own experience? A lively illustrated contemporary professes to have interviewed the veteran Polish doctor, and to have obtained from him a recipe for a long life and a hale old age. The details of the prescription as they lie before us are delightfully simple; but to some minds a preliminary question will very likely occur, that question being whether it is certain that the result obtained by Dr. Wielobycki is to be desired, even although both the elements in it could be guaranteed—the hale old age as well as the long life. On this point we should imagine most men will have grave doubts. After four-score years, according to a very ancient authority, there is little to be looked for but labour and sorrow. In the Seven Ages of Man, the last scene of all is not one that is painted in specially attractive colours:—

"Second childishness and mere oblivion,

Sans teeth, sans eyes, sans taste, sans everything."

That is not a picture that is likely to make anyone fall deeply in love with extreme old age. There are always, of course, brilliant exceptions; and many would, no doubt, be inclined to cherish the pleasing hope that they too would come in among the exceptional cases. And, at all events, whatever we may argue about the undesirableness of unduly prolonged life, there are few of us who at any given age are prepared to say, "Now, this is enough;" and it may be worth while, therefore, to spend a few minutes in the examination of Dr. Wielobycki's recipe.

According to the interviewer, the chief articles in Dr. Wielobycki's hygienic creed were of a negative character. If you want to attain to the age of one hundred years, don't smoke, and don't drink, and don't eat flesh, and don't lie too long in bed—these negatively, and, positively, take as much out-of-door exercise as you can. There are some people who are accused of taking all the negatives out of the commandments, and putting them into the creeds; and we suspect that a great many will be found who will have nothing to do at any price with these negatives in the creed of Wielobycki. Even as it is, with all that can tend to enrich life and make it beautiful and attractive, we have had Mr. Mallock for a good many years with us now, insisting on an answer to his dreadful question: "Is life worth living?" And if you are going to take away their little luxuries, and even deny them access to the butcher's shop, you will find plenty of people who won't listen to you when you tell them that their reward will be that they will live to a hundred. Extreme old age at any price, even if fairly good health be thrown in into the bargain, is not a prize that many will be eager to compete for. Beating the record is often a very costly business; and in this matter of longevity, too, most will be of the opinion that *le jeu ne vaut pas la chandelle*.

And when we come to look more closely into the directions said to have been given by the Polish centenarian, we find that, after all, there is not a great deal that can be considered as of exceptional value. In fact, if the truth must be told, a good many truisms and commonplaces have been put into Dr. Wielobycki's mouth, and we are asked to regard the sum of these as a prescription for attaining to longevity. That smoking is hurtful to the young, and that smoking to excess is injurious at any age, we need no centenarian to tell us. But that smoking in moderation spoils the digestive powers is a statement which we take the liberty of calling in question. The physiologists tell us that all the parts of the mucous membrane stand in so close a relation to one another that they are mutually sympathetic, and that consequently whatever stimulates, for instance, the salivary glands tends to excite also the action of the gastric juice. Now, men who smoke know very well that when the digestive processes seem to be going on only after a sluggish fashion, a cigar or a pipe will hurry up the laggard powers; and no doubt the explanation of this physiological fact is that the same cause which promotes the flow of saliva in the mouth promotes also the flow of gastric juice farther on in the alimentary canal. Dr. Wielobycki is also credited with the sentiment that the smoking habit and the drinking habit are intimately associated together. The steps in the logical argument are these:—To smoke makes one feel dry, makes one wish to drink, and that leads to drinking. This is a fine example of the logical fallacy of Confusion of Terms. The word "drink" in this chain of reasoning is used in two different senses. The writer of these lines is a teetotaler; and, although he has been a smoker for many years, he has never felt the least inclination, as a result of that habit, to resort to alcoholic liquors. Of course drinking is an evil. "It's a bad thing, whusky; especially bad whusky." We are all at one with Dr. Wielobycki when he says that "No man who drinks—at all events, who drinks much—can expect to enjoy perfect health." But we seem to have heard something extremely like this before. It can hardly be regarded as one of the novel ingredients in the centenarian's recipe for walking in his footsteps and reaching his goal. Neither can much be said of the novelty of the advice not to lie too long in bed. "Early to rise" has long been associated with the preservation of health; and if you can preserve your health you have a fair chance of a good old age.

The case for vegetarianism is summed up by the doctor in the statement that flesh is undesirable as a constituent of food, because it contains parasites which may breed disease in the body; but we fear that it will require arguments a good deal stronger to make those give up eating meat who have never suffered any inconvenience from the habit. When we have mentioned out-of-door exercise we have exhausted the ingredients of the prescription attributed to the recently-departed veteran; and this also is so thoroughly recognised an element of hygiene that it must be considered as emphatically belonging to the category of commonplace. No doubt it is needful that these commonplaces be from time to time emphasised. But the sum of the whole seems to be that if you would preserve health and attain to long life, you must be temperate in all things—in eating, in drinking, in smoking—keep a good deal in the open air, and take a reasonable amount of out-of-door exercise. There is nothing very novel in all this; but if you really desire to rival the Polish centenarian in the matter of length of days, you must try to begin with the splendid constitution of a Wielobycki.—*Sanitary Record*.

TEN THOUSAND POUNDS PER ANNUM MAY BE EARNED at too great a sacrifice, if we ruin our health and happiness during its accumulation. Although money is a necessary article to possess in order to obtain the means of existence, it cannot purchase love, friendship, or immunity from the dangers and pangs of disease. The millionaire has often envied the toiling labourer his hearty appetite and sturdy health, and would gladly have sacrificed a large amount of his wealth in exchange for these blessings. Holloway's Pills, however, can give health to the most delicate. They are the precious key which can open the door leading to the smiling valley of health. They purify the system and give the essentials of strength for the blood.

## OFFENSIVE NASAL DISCHARGE.

**OZÆNA**, or offensive discharge from the nose, is one of the most disgusting infirmities. He who has once experienced the odour can never be mistaken in it. Should he ever find himself in the presence of a person affected with this complaint. Nothing is more unpleasant than to be compelled to converse with an individual suffering from ozæna, to be obliged to respire the poisoned currents of air which escape when he breathe; people afflicted are avoided by all their friends, who feel nausea in the bare anticipation of approach; no one, whether in the school, the workshop, or even at home, desires their company.

The causes of ozæna are obscure, but it is most frequent in young women at the period of puberty. It is found in all classes of people and in all temperaments, however strong otherwise. At its commencement the patient hawks a great deal, the nasal secretion, being sticky and adherent, falls down the throat, where it becomes semi-solid, like wax. Gradually it dries up, and the hawking becomes continuous, though little is expelled, except now and then a large mass of secretion of penetrating infectious odour. People who complain continually of bad-smelling breath attribute it to a bad stomach or bad tongue, and too often doctors confirm them in this opinion; but, too often, alas! the cause is commencing ozæna. They are told the odour will depart when the stomach is better, but it is just the contrary. When decomposed matter no longer falls into the throat, it will no longer be swallowed, the food will not be sown with microbes of all sorts, and the stomach will then, but not till then, properly fulfil its functions.

The treatment consists in irrigating the nostrils in the manner above mentioned until the membrane is as clean as possible. Salt water must be used in order not to deprive the mucous membrane of the salts which it contains. If plain water is thrown into the nose, mouth, rectum, or other passage, a part of the chemical constitution of the mucous membrane will pass into it. Moreover, if it is necessary to wash the mucous membrane, it is already unhealthy enough for us not to render it more so by depriving it of its salts. Antiseptics—such as sublimate, carbolic, or boracic acids—may always be added to the salt solution. The saline irrigation must be kept up until there is not a suspicion of secretion in the water that comes away, even if it be necessary to irrigate for one hour. To assist the detachment of adherent crusts, vaseline, medicated with boracic acid, or salol, may be smeared over the inside of the nostrils, or powders of these drugs may be used as insufflations. Every discharging nose, like every discharging ear, thoroughly irrigated, ought never to be offensive. As a curative treatment, if we have the opportunity, we give preference to electrolysis; but this, of course, is only to be used by an expert hand.

## SPECIALITIES.

### KINGZETT'S SULPHUR FUMIGATING CANDLE.

**THE** Sanitas Company, Limited, have submitted to us for investigation and experiment some samples of Kingzett's Sulphur Fumigating Candles. Sulphur, as is well known, is the fumigator *par excellence*, always employed for the disinfection of wards and rooms, as well as of railway carriages, bedding, clothing, and drapery, after infection by cases of cholera, small-pox, diphtheria, and other contagious diseases. It is unnecessary, therefore, to emphasise the importance of a method by which these results may be so readily and adequately secured. The candles are supported in conveniently arranged tin vessels, the larger of which are so made as to admit of the evaporation of water coincidently with the production of sulphurous anti-hydride. In this manner the disinfectant is brought into actual contact with every part of the surface area to be disinfected, and in such a form as to be most efficient for the destruction of germ life. Instructions for use accompany each tin, so that no difficulty need be experienced in their application.

## CHILDREN'S EYESIGHT.

"**BURN** your books over ten years old," said an eminent surgeon to the students in one of our London hospitals a few years ago, and the remark had become a professional axiom. New forms of disease need other methods of treatment, and science, like the leech's daughter, is ever demanding more, more! This is especially true of optics.

The letters of Mr. Aitchison, the oculist optician of Fleet-street, published recently by the *Times*, certainly did much good by drawing public attention to the fact that proper care is not being taken by parents as to the eyesight of their children. It is not our purpose to say whether Mr. Aitchison's theories are absolutely correct, but there are many points in connection with them which must go straight to the understanding of those who have considered the subject, and awake the attention of all who have previously passed it over thoughtlessly.

The tendency to short sight, for instance, among our young people, Mr. Aitchison remarks, is becoming so alarming that it is one of the most difficult problems which our oculist scientists have to deal with, whilst the difference in the focus in the eyes of the same person is perceptibly on the increase. This being so it becomes a matter of national as well as individual concern, whether our eyesight be good or bad. The examination of the eyes is not now an indefinite science since the invention of the ophthalmoscope, so wonderful in its simplicity, by Helmholtz, enables the practitioner to illuminate the interior parts of the eye so clearly that he is not obliged, for want of more accurate knowledge, to include a large number of the affections of the deep-seated parts under the designation "Amaurosis," to which the well-known definition given by Walther applied but too well, "a condition where the patient sees nothing and the doctor also—nothing." Short sight and other kindred defects, however, which make themselves known in the fact that the person afflicted cannot see as well as his fellows, are not the most dangerous troubles, because, as a rule, the defect is noticed and a remedy looked for. Mr. Aitchison in his letters to the *Times* draws attention more particularly to the defect called Hypermetropia, which is, to quote his own words, "A state of the eye in which the optical axis is too short, and rays of light do not focus perfectly on the retina, but would focus properly (if they were not stopped in progress) at a point beyond the retina." The peculiarity of this defect is that it may not be apparent *i.e.* a child may suffer from this defect and yet be able to see well to all appearances, because a child has very great muscular power over the eye, and is able to force the ciliary muscles to such an extent that, whilst looking at a definite object, the eye practically assumes its normal shape. As a rule this defect is only remarked when the age for regular study is reached, then complaints of headaches and nervous pains are made, and the average medical man who may be consulted frequently does not detect the "refraction headache."

The question now arises, what is the remedy for this? It certainly does not exist in the old-fashioned system of haphazard purchase of spectacles. Nine out of ten of these defects can be corrected and many eventually cured by the proper use of spectacles, but it stands to reason that to allow purchasers of spectacles to choose for themselves is bad; and, paralleled by the attempt to foist upon the public an automatic machine with which it is pretended to test the sight, it is absolutely impossible for sufferers to know without skilled aid the glasses that will correct their defective vision, and in this matter we believe Mr. Aitchison is the pioneer of a system which must eventually become universal. He has studied the subject in all and every detail, and his system is probably the most perfect in existence. He makes a careful examination of the eyes in every instance, and prescribes glasses or not as may be necessary, but the most important and valuable part of the system is that the patient treated is required to present himself again at stated intervals for examination, so that the progress of the defect may be noticed and the proper remedial measures carried out.

"The FAMILY DOCTOR may be recommended as safe and useful in all Households."—*The People*.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**PORK PIE.**—Make raised crust of one pound of butter, one-half cupful of hot milk, scattering one-fourth pound of bits of butter or lard over paste in rolling out. Line small dish, or small dishes, pinching a fold around the bottom. Fill with little pieces of seasoned pork, and cover with gashed paste, rubbing crust with egg, and bake.

**PRESSED BEEF.**—Buy three or four pounds of beef from the neck; boil or steam until the bones will fall out, using but little water; salt and pepper it just before taking up; pick out the bones and pack the meat in a dish in which you can press it nicely; leave a little of the liquor in the meat, and apply a heavy weight for several hours. This is a savoury and economical dish.

**AN APPLE SALAD.**—For the basis use solid tart apples, pared and cut into small bits. With this mix an equal quantity of celery, cut in bits of the same size. After thoroughly mixing, dress them in the salad bowl with a simple mayonnaise made as follows:—Into the yolk of one egg, previously beaten, drop a sufficient quantity of salad oil, slowly making a thick cream, which should then be thinned to the proper consistency by vinegar, added as carefully. Add pepper and salt to taste, and the mayonnaise is ready to dress the salad.

**CURRENT PIE.**—Take one and a quarter pounds of cleaned currants, the juice and grated rind of one lemon, half a pound of sugar, two large tablespoonfuls of cornstarch dissolved in water, a small piece of butter, two eggs, well beaten. Cook currants about an hour in sufficient water to cover well, and then add eggs and cornstarch.

**BEEF TEA.**—Nearly everyone has their own recipe for beef tea, but this fashion of making it will be found easier than most recipes. Cut a pound of lean beef into thin slices, put it into a pan with two pints and a half of cold water, set it over a slow fire to become gradually warm, removing the scum as it rises. Let it continue gently simmering for an hour, then strain through a fine sieve. A little celery seed and a whole carrot boiled in it will improve the flavour. Let it stand ten minutes to settle, then pour off the clear tea. Salt and pepper according to taste, taking care not to put in too much of the latter condiment.

**CHICKEN BROTH.**—A very strengthening chicken broth may be used as a substitute or alternative for beef tea, and may be made in the following fashion:—Bruise a fresh young chicken, put it in a saucepan with a quart of water, let it simmer till the juice is entirely drawn from it. Strain and return the soup to the saucepan, adding salt, pepper, and a little rice; a few young vegetables may be added with advantage, and may be put in at the same time as the chicken, so that they may be boiled very tender.

The best way to fry apples is to halve them, remove core, put some butter in frying-pan, and put in the halves, the cut side down; then add a little water, and let boil dry; then fry.

**LOBSTER CHOPS.**—Remove the meat from shell, break the shell into small pieces and boil for two hours; chop the lobster meat fine, and add to it a pinch of cream of tartar, a little mustard, salt, pepper, allspice, chopped parsley, yolk of one egg; make into shape like French chops, roll them in the beaten white of an egg and bread crumbs; fry brown; when done stick a claw in the end of each, place mashed potato in the centre of a platter, and the chops around the edge, and serve with this sauce: Strain the water from the boiling shells, put in a tablespoonful of butter, one teaspoonful of flour previously browned in the oven, a little allspice and mace, let it boil up once, and send to the table in sauce tureen.

**MASHED POTATOES.**—The potatoes for mashing must be perfectly soft, but not so soft as to fall into pieces. The least bit of a "bone" in them makes the mash lumpy. When they are quite dry and steamed through, transfer to the mashing dish, which has been warmed, and add

cream, butter, and salt in quantities to make the mixture rich and toothsome, then mash thoroughly, and above all things keep it hot. Pile up in a hot dish, and smooth gently with a knife if you cannot endure the rough appearance of the pile, otherwise do not. Serve instantly. Pepper may be added in flecks if desired. In preparing potatoes for cooking select those of a size that one may not be underdone when the rest are ready to be taken from the saucepan.

**BAKED POTATOES.**—Wash very clean potatoes of uniform size, and cut off a little piece from each end. Bake slowly till done, turning once. Never cut a baked potato, but break with fingers. The potatoes may be carefully pared, and then baked. Many persons are fond of the crisp crust. Those left over from dinner may be sliced for supper in thin slices in a baking-dish, and lumps of butter and salt and pepper laid over them. If salt pork is liked, some slices of this may be put on top. Bake for half an hour. Raw potatoes cooked in this way make a delicious dish.

**POTATOES HASHED AND BROWNED.**—Hash coarsely a quart of cold boiled potatoes; sprinkle them with salt and pepper. Put a tablespoonful of butter in a saucepan; when it melts, stir in a tablespoonful of flour. Stir till brown, then add a cupful of stock. Stir till smooth, then add the potatoes. Cook them five or six minutes, and set them back on the range. Put a large tablespoonful of butter in an iron spider, and when the butter is very hot pour in the potatoes, and set the spider where they will brown on the bottom. In fifteen or twenty minutes fold like an omelet, and serve immediately. A cupful of any brown gravy can be used in the place of stock.

**ESCALLOPED POTATOES.**—Butter a tin dish. Slice cold boiled potatoes, and place in layers in the dish with lumps of butter, a little salt and pepper between each, and a slight sprinkling of flour. Fill the dish. On the top put a layer of bread crumbs one-half inch deep. Over this pour one cupful of cream. Bake in a moderate oven for half an hour.

**POTATOES "A LA NEIGE."**—These are made by pressing the mashed potatoes through a colander or vegetable strainer. It makes a dainty appearance.

**POTATOE CROQUETTES.**—Take warm mashed potatoes, and add the beaten yolk of an egg, and a little cayenne pepper and nutmeg. Beat thoroughly, and mould up into balls or oblongs. Roll these in egg, and then in fine bread crumbs, and fry in boiling lard.

## HINTS FOR THE HOUSEHOLD.

**TO CLEAN SILK.**—The garment must be first ripped and brushed. Spread on a flat board an old blanket covered with an old sheet; then sponge the silk on both sides, rubbing any dirty spots particularly with this mixture: One-half cup of gall, one-half cup of ammonia, and one-half pint of tepid soft water. Roll the silk on a stick—an old broom-handle will do—being careful that no wrinkles are left on it. Let it dry without ironing. Woollen goods may be treated in the same manner.

TRY cleaning undressed kid-gloves with naphtha.

TRY a ring of platinum around the lamp in a room where much smoking is going on.

TRY removing ink stains from marble with lemon juice.

TRY cleaning marble with a mixture of two parts of soda, one part of pumice stone, and one part of fine chalk mixed with water and washed off with suds.

**SMELLS GOOD AND KEEPS AWAY MOTHS.**—A pleasant perfume and moth preventative is made of cloves, caraway seeds, nutmeg, mace, cinnamon, and Tonquin beans, of each an ounce. Add as much Florentine orris root as will equal the other ingredients. Put together, grind all to a powder, and put in little bags among your clothes.

A MEANS of preventing the tarnishing of silverware by exposure to the air or from sulphur fumes liberated by heat, is by painting it with a little soft brush dipped in alcohol in which some collodion has been dissolved. The liquid dries immediately, and forms a thin, transparent, absolutely invisible protection. It can be removed any time by dipping the article in hot water.

To get a good polish on mahogany easily. Mix one part of boiled linseed oil with two parts of alcoholic shellac varnish. Shake well before using. Apply in small quantities, with a cloth, and rub the work vigorously until the desired polish is secured.

**LOTION FOR PAINFUL SWELLINGS.**—No matter in what disease they may occur, or what their cause, the heat and pain of inflammations and swellings can almost be miraculously subdued by the following lotion. Mothers and housekeepers should note that this is included in their list of handy household remedies: One-half ounce of sugar of lead, one-half gallon of water, and one-half pint of alcohol should be thoroughly mixed together, and kept in a stone jug ready for use. When it is to be used shake well, then saturate cloths with it, and lay over the affected parts. When they become dry and warm, simply moisten them with a small quantity of the lotion. This truly "acts like a charm."

**HAPPINESS IN THE HOME.**—In the family relation everyone should be at his best. The home ought to be a heaven. It ought to be as nearly heaven as is possible on earth. There should be no purposely withered flowers about the hearthstone, and no purposely clouded sunbeams. Selfishness alone ought to be sufficient to make home conduct exemplary. Certainly all want a pleasant home. Certainly all want smiles instead of frowns. Home should be just one continual blaze of sunshine. But it cannot be while some member of the family circle is snapping and fault-finding and selfish. Do people ever go more deliberately and insanely at work to make themselves miserable than they do when they deliberately cloud the lights of the only place on earth where they have any reason to expect anything like perfect quiet and happiness.

**TOOTH-POWDER** is an excellent cleanser of fine filigree jewellery.

**CORKS** warmed in oil make excellent substitutes for glass stoppers.

**THE fumes** of a brimstone match will remove berry stains from the fingers.

**MILK**, applied once a week with a soft cloth, freshens and preserves boots and shoes.

A **LUMP** of camphor in your clothes boxes will keep steel ornaments from tarnishing.

**GREASE** may be taken out of carpets by covering the spot with powdered French chalk, laying a soft brown paper over the chalk, and covering with a warm iron.

You can drive nails into hard wood without bending them if you dip them first in lard.

**LIGHT** scorch marks may be removed by simply moistening them with water, and laying in the sun.

If one wishes to cool a hot dish in a hurry, it will be found that if the dish be placed in a vessel full of cold, salty, water it will cool more rapidly than if it stood in water free from salt.

**BEST NUMBER AT A DINNER PARTY.**—A well-known and popular diner out, as popular with one sex as the other, was asked what he considered to be the best number for a dinner party. His characteristic reply was:—"Two, or if not, four, three of them being ladies." He then conceded that eight was the outside limit diners should reach. It offered advantages all round, socially and domestically speaking. Socially, because the eight guests could be chosen to form a perfect octave as regards knowledge of each other, reciprocity of tastes, personal regard, and the rest; domestically, because the household staff would be equal to the demands made upon it, and no outside element need be introduced to disturb the precision and order of the whole.

# THE MOTHER'S PAGE.

## FOUNDATION OF MUSICAL TASTE.

By L. H. N.

THE cultivation of a love for music should begin in earliest childhood. While the number of mothers who can sing artistically and perform on some musical instrument masterfully is small, there are few who cannot sing or play a little, and many who can both sing and play well. The commencement of the musical education of a child may be the first step toward a higher cultivation of the musical taste of the mother. Suppose she has been limited to the humming of a few pretty tunes, caught by reason of marked rhythm and jingle. This humble *répertoire* should not be despised, but used as a foundation for better things.

Many a tired child has been soothed by songs no better than "Poor Nellie Gray," and transported with delight by the old-fashioned ditty with the refrain:—

"I'll chase the antelope over the plain,  
The tiger's cub I'll bind with a chain."

If a mother is deficient in the knowledge of music, there will always be some friend or person near at hand who has made it a special study, perhaps for years, and who will gladly give suggestions as to a wise choice.

Carl Reinecke's children's songs are delightful for singing by the cradle, and as they become familiar by repetition, the beauty of the composition will be greatly enjoyed, while the ears of the infant child will become accustomed from the very first to the best music. When the child is six months old, Frœbel's "Mother Play and Nursery Songs" may be used. They appeal to the rhythmic sense, which is the first element of music to be developed in the child. The mother may gently move the limbs of the child as she sings. As the child grows older, he will try to make these motions unaided, and later on will be at perfect time, either by clapping the hands or moving the body.

The characteristics of the child's mind in its gradual unfolding are similar to the characteristics of primitive people whose music is like an elaborate system of time beating, with little variation of tone. By keeping this fact well in mind good results may be had in developing a child's sense of rhythm. The practice of singing to the child cannot be too highly commended, for it has much the same effect as speaking to the child. How could he learn to articulate if he did not hear speech? Classic music has the same effect upon him as correct speech. Although at first the child may not discriminate, little by little his taste is being formed.

Mr. Du Maurer says:—"Evidently our brain contains something akin to a photographic plate and a phonographic cylinder, and many other things of the same kind not yet discovered; not a sight nor a sound nor a smell is lost; not a taste nor a feeling nor an emotion. Unconscious memory records them all, without our even heeding what goes on around us beyond the things that attract our immediate attention." Thus year after year the child will reproduce in his life the impressions of the past. What he has been makes him what he is, and he must be educated for the future, while the present takes care of itself.

The value of musical training can scarcely be over-estimated. We remember how the Athenian child was sent at an early age to three schools in succession—the school for grammar, the school for gymnastics, and the school for music. The music master taught his pupils to sing by first chanting the music, while they listened. The instruction on the stringed instruments followed the singing. Great value was attributed to music in those times by the wisest of men, who held that music inspired the soul with a love of order and harmony. It had a prominent place among those wonderful people; even their history and laws were sung.

Almost every mother can testify to the direct

moral and spiritual influence of music in her own life, and that it should have a prominent place in the home life is often greatly desired. As soon as simple songs are learned by the child, they should form a part of the family music. During times of social family gathering let one or more of baby's hymns or songs be sung.

As the child grows older, he may have as an incentive to practice the promise of playing the piano accompaniments while papa and mamma sing. In a beautiful home where unity in the family is specially marked, the mother sits with her children through the music lesson, and they stay with her while she takes a lesson. They study and practice together, and the result has been unusual proficiency on the part of the children, and an eagerness for the usual irksome practice, while a new charm has been added to a home life inexpressibly precious to all.

## EDUCATE THE BODY.

A NEWSPAPER article upon the Prussian athlete, Eugene Sandow, can be read by mothers, with instruction as to the athletic education of children. It is the patriotic duty of every woman to rear a family that, physically, shall be an improvement upon the generation to which she belongs.

Sandow owes his Sampson-like strength to the fact that his father took him to Rome when a mere boy, and showed him the wonderful Greek statues, among them those of Hercules. The boy asked his father why men were not physically like the Hercules. The father told him then of the effects of physical education. Sandow began at once, and is now famous. His feats of physical strength are past belief.

In the first place, a woman should prefer a man whose physical strength seems adequate to work as a husband. It has been said that love and common-sense never go hand in hand. Then I say that it is better to marry with common sense than love which walks into sure misery. Given a husband and wife in good health, and children should be healthy, if cared for in the proper way. But to improve the physical being in a generation requires direct education in that line. To a certain age, hardly beyond babyhood, boys look beautiful, inasmuch as they resemble fair women, but after that time the boy should be clothed and directed in such a manner that all effort, the very life of him, should be towards making him a power in life—a man.

It is the duty of parents to rear a son who shall be an honour to a country, as a citizen, a husband, and a father, improving his family as a part of the plan the Creator has for the progress of mankind. Why not direct the physical education with solicitude and intelligence? The boys are to be as young lions, while the girls' early years, happy and care free, are to develop their sacred bodies, so that the sufferings which generations of physically ignorant ancestors have entailed upon them, may be a little counteracted.

We recently met with a young girl who "ran wild" until she was ten years old. In the tired and hot city she was the freshest and most real thing we saw. An untamable spirit, a free strength of will and readiness of action, plead with me for the little ones, who, at six, spend wearisome hours in a schoolroom. Who cared whether this girl of whom we speak read at seven or twelve? Who cared whether she had studied logics and isms?—Not one of the world that fell at her feet and loved her for her splendid physical strength, which gave her all that nerve and soul energy. Either a man or a woman, to be a thing of sure delight, must be physically presentable.

Then we say to parents, educate physically. Consider it more necessary than French or German, or music and drawing. Consider its pursuit more than the sewing on of embroidery and the following of styles. Consider the body of your child as a mother temple of God, and rear it in a fashion that will be to your credit. There should be symmetry to its parts, that it be grand and pleasing. You will be with the

tide of public opinion. In all our cities are gymnasiums and societies for the promotion of physical culture. You will be in the fashion, for it, at present, is a fad, called by the names of physical culture, *delsarteism*, gymnastics, or what you will. You will not only be doing right, but in the future the delight of your eyes will be in the splendid figure of your daughter and the brawny strength of your son. In the sunset of lives it is a good thing to see such rewards rise up before you.

\* \* \* \*

## THE CHILDREN'S ROOM.

How peaceful at night  
The sleeping children lie.  
Each gentle breath so light  
Escaping like a sigh!  
How tranquil seems the room, how fair  
To one who softly enters there!

Whose hands are those, unseen,  
That smooth each little bed?  
Whose locks are those that lean  
Over each pillowed head?  
Whose lips caress the boys and girls?  
Whose fingers stroke the golden curls!

Whose are the yearning eyes,  
And whose the trembling tear?  
Whose heart is this that cries,  
Beseeching God to hear?  
Whose but the mother's, in whose face  
Love shows its sweetest dwelling place.

Her hopes in beauty bloom,  
And Heaven sends down its light,  
Which lingers in the room  
Where mother says: "Good night."  
Soft treading by the sleepers there,  
Her very presence seems a prayer!

## TRUE HAPPINESS.

CAN we associate true happiness with an unhealthy state of the body? No, the two cannot be associated, for in true happiness we must have a perfect tranquil state of the mind and a sound condition of the body. A morbid state of the mind has a reflex action of a weakening character upon the body, and *vice versa*. It was Sydney Smith who believed it possible to feed or starve people into virtues or vices. Now all physical exertion, no matter whether it be of the mind or body, means expenditure of force, and needs replenishment. Thus the business man of to-day who exercises his brain excessively will naturally require more brain and nerve food than the labourer who has bodily exercise only; and the food which the labourer eats and thrives upon may prove perfectly unsuitable for the brain-worker. Phosphorous, that great nerve tonic, is what the latter requires, but it must be presented in an assimilable form. He will also require concentrated nourishment when in that low, feverish, irritable state which we see so on the increase around us. There is nothing better in these cases of over-fatigue and nervous prostration than Nature's remedy—perfect rest for a few days, and a tablespoonful of Oppenheimer's Cream of Malt with Cod-liver Oil and Hypophosphites taken regularly with meals; this will soon dispel the trouble and bring happiness not only to the man himself, but to those who are about him. What more convincing proof can we have, for instance, of the close association and action one upon the other of the mind and body, than in the liver sufferer. The most amiable of men suddenly become morose and ill-tempered directly they become "liverish," and the moment the affection is dispelled, as with a *Eunonym* *Palatinoid* twice a day, they as soon regain their usual joviality and geniality of disposition. Yes, there is a great deal of truth underlying the sentiment of feeding or starving a man into virtues or vices. If we cut off those substances which tend to replenish the exhausted system, we weaken the mind as well as the body, and both suffer in consequence.

STEELEMAN'S Soothing Powders for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve healthy state of the constitution during the period of teething. Manufactured only at Walworth, Surrey. Sold everywhere. Please observe the *SE* in Steedman.

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch*.

[SPECIAL ARTICLE.]

## HOW TO REMAIN YOUNG

By W. B., M.D.

MODERN times are characterised by the quest of means for preserving dignity and beauty in old age, instead of maintaining it in a pitiable and often irresponsible state. In general the works of the ancient classic writers are replete with lamentations on the flight of youth, a state of things which is, after all, quite natural, since to the idea of age was connected that of illness, lack of beauty, loss of memory, imbecility, peevish humour, and all sorts of evils. Now we begin to perceive that the miseries of age are due to causes which we have the power to remedy.

If we learn to prolong age, we shall at the same time prolong youth. We see the young man launched into the world on leaving school, where he has acquired a certain number of useful things which, after all, he has but touched upon. He smokes because he considers himself a man, he drinks, frequents theatres where the atmosphere is over-heated. He acquires a sort of common sagacity, he learns that he cannot glean in the vineyards of others, and that all humanity is governed by that magic word "interest." He becomes then a respectable citizen, whose boots are always glossy, whose brow is sufficiently contracted by the cares of life, and still further compressed by a hat of stiff silk. He gives himself up to his affairs in the omnibus, and he returns home in the same vehicle. Result: a portly stomach and a steady income.

Suppose now, that instead of curbing his youth to the yoke of conventional habits, he took oath to himself to follow certain very simple rules. For example:—

1. To walk always straight in the path of truth.
2. To bathe in cold water every morning, and every day to breathe fresh and pure air, unless prevented by exceptional circumstances.
3. To eat moderately of the most simple meats, and to take neither stimulants nor narcotics.
4. To pass at least two hours of the day in active exercise in the fresh air, including as a minimum ten minutes of smart running.
5. To sleep eight hours, and to go to bed early.
6. Always to have the mind or the body occupied.

The result will be that youth, launched into life with a good capital of health and vigour, will be in no great haste to depart.

What is of the most importance is always to make one's diet quite simple and wholesome, chiefly consisting of fruit. In the case of ordinary food, we ought to masticate slowly, giving each piece forty impressions of the teeth. To those who eat chiefly of fruits we need only say, "Enjoy your food, and don't eat too quickly." Another general rule: Do not eat meats which cannot be taken without condiments, nor except in great quantities.

Schopenhauer, who, despite his pessimism, found life sweet and derived many a pleasure from it, wrote in his old age: "I run like a hare, I play the flute every day, and, except for my deafness, I cannot complain of my health." Those who have read his biography know that he lived with great regularity, never missing his morning bath, taking two hours' exercise, &c. His mind was active to the end, and he died suddenly without illness. Never overworking, he kept his mind and his body healthy; still I am convinced that he was ignorant of what perfect health is, just as we are wholly ignorant of those truths which are accumulated by many generations.

One thing is absolutely stupifying, that is the beneficent power of Nature. It is truly astonishing that we still keep ourselves on our feet, who squander the materials of life, thanks to war, to customs, habits, and drugs, who consume adulterated food and drink, and who deliver ourselves over to luxury and debauch. Whenever I ask why a child cries the whole day, I am certain to learn (not from the mother) that it is treated in a manner far from rational. Who shall enumerate the evils which ignorance

produces? To bring up a child exclusively in a town is a veritable crime.

I do not doubt that towns may some day become enchanting spots, but we are still far from the cities of the future. Ours are sinks, where people are huddled together in tainted atmospheres, wrapped in a fog of smoke and unhealthy vapours, in the midst of a chaos of cries, of vociferations, of a harsh jumble of discordant sounds, of the noise of vehicles, and of wild songs in a labyrinth of dirty streets, stinking of all the smells of houses and kitchens, when one is over-depressed by the sight of poverty, of filth, and of ugliness, hideousness, both physical and moral.

*Nobis placeant ante omnia silva.* I rejoice that man cannot reach to the blue sky, he can hide it with smoke, but it remains blue over the greater part of the globe. As it is blue, confess that it is hard that we cannot see it. Oh, let us freely rejoice in fine weather and revel in the rosy tints of dawn!

## SORE THROAT.

SORE THROAT is so common a malady that it is worth while to study the indications for treatment under the different phases on which it manifests itself. The term includes inflammation of the back part of the mouth (that is, the pharynx), of the veil of the palate and parts surrounding, especially the tonsils. It generally begins by a sense of extreme dryness of the throat; then the pharynx becomes red, the tonsils swell, swallowing becomes difficult, and there is a peculiar feeling of discomfort. We should watch these early symptoms, for unless we are careful a very prolonged illness may supervene.

At the first onset, the patient should use gargles of water, containing either carbolic acid or boracic acid: a grain to the ounce of the former, or ten to fifteen grains of the latter. At the same time, two or three grains of salol a day is one of the best drugs against complications. The gargle should always be tepid. It should be held at the back of the mouth in such a way that it comes into contact with the whole of the pharynx, the tonsils, and the soft palate. The greatest care should also be taken of the teeth. In ordinary health the hygiene of the teeth is very important, but it becomes trebly so when the pharynx is the seat of inflammation, thus rendering it much more liable to the attack of micro-organisms and infectious germs, of which the teeth are very often the receptacle, through alimentary debris and other matters which are retained in their interstices. Generally speaking, simple, ordinary sore throat will be relieved by this method: Prolonged and properly applied antiseptic gargles, with perfect cleanliness of the teeth.

But sore throat is not always so simple; frequently it is the local expression of a general infection of the system. It is no longer a mere sore throat, it becomes an angina; and to the local troubles of dryness and difficulty in swallowing are added general constitutional symptoms, especially headache, fever, lassitude, and want of aptitude for any occupation. In these cases general as well as local treatment is indicated. For the headache and fever, give antipyrin, salol, or quinine, which also combat the lassitude and general weakness. Sometimes, if the throat be much swelled and there is suppuration of the tonsils, an emetic may give ease by mechanically rupturing the abscess. Warm antiseptic gargles of carbolic or boracic acid are to be constantly in use.

Very often sore throat is only a consequence of affections of the nose, such as hypertrophy of the mucous membrane, or chronic coryza. The nasal passages become obstructed, respiration no longer takes place through them, but through the mouth. Thus the inspired air impinging directly upon the pharynx, without being warmed, moistened, and filtered by the nasal mucous membrane, irritates the throat, and causes dryness and inflammation, often misleading the doctor who neglects to examine the nose. On the other hand, if the passage of air through the nose is too free, owing to atrophy of some of its parts, the same thing results, the nose not properly fulfilling its

respiratory functions. Thus throat diseases frequently necessitate the treatment of a primary nasal affection, and it is incumbent upon every practitioner to examine the nose at the same time that he inspects the pharynx.

[SPECIAL ARTICLE.]

## ADULTERATION OF FOODS.

ABSTINENCE FROM MANY "PREPARED" FOODS A SAFE RULE TO FOLLOW.

By AN ANALYTICAL CHEMIST.

PRESERVES, MARMALADE, &amp;c.

A LARGE share of the preserves manufactured for the retail trade are adulterated more or less in one way or another. It is customary to make into preserves inferior fruit, or that which has spoiled by too long keeping, or is otherwise unfit for sale. In many cases preserves are coloured with fuchsin and aniline, as are some canned fruits. Marmalade often consists chiefly of apples flavoured with orange essence. Copper is also sometimes found, as in canned fruits, usually being accidental, however. Its presence is due to the fact that preserves are generally made in copper kettles, and some of the copper is dissolved by the juice of the fruits, the solution of the copper being facilitated by the heat and the stirring. A compound of sugar with copper is also formed when the two are long in contact. On this account preserves should never be made in copper kettles. The presence of copper and colouring matter may be determined in the manner described for detecting these adulterants in canned foods.

JELLIES.

It is rare to find in the market such a thing as pure fruit jelly. If found, it will be held at a high price. The ordinary jellies sold are largely made up of gelatine, coloured with aniline and other dye stuffs, and flavoured with various essences. Many of them contain not a particle of the fruit after which they are named. A less harmful, but no less fraudulent, form of adulteration is the use of apple jelly flavoured to suit the different varieties for which it is sold. So few colouring matters are pure, it is best to avoid them altogether.

FRUIT EXTRACTS.

The science of chemistry has lent its aid to the art of adulteration so effectually that almost, if not quite, every one of the fruit flavours is so closely imitated by chemical compounds that the difference cannot be detected by the taste, though undoubtedly the difference is readily noticed by the stomach. The following description of the composition of some of the principal flavouring extracts we condense from a report which appeared in 1873:—

Pineapple essence is a solution in alcohol of butyric ether, which is made by distilling butyric acid with alcohol and oil of vitriol. The butyric acid is made from decayed cheese.

Quince essence is a solution in alcohol of an ether obtained by treating oil of rue with aqua fortis, and digesting with alcohol the acid thus obtained.

Pear essence is made by distilling a mixture composed of fusel oil, acetate of potash, and a strong sulphuric acid, or oil of vitriol, and mixing the product with alcohol.

Apple essence is made from sulphuric acid, fusel oil, and valerianic acid.

The flavour of currents, bananas, raspberries, strawberries, &c., is imitated by mixing the various ethers known to chemistry, and combining with them camphor, acetic acid, vanilla, and the various essential oils.

Not only are these essences sold at retail for domestic use, but they are largely, in fact almost exclusively, used by bakers and confectioners. Pastry, jellies, and ices are made still more atrocious by the addition of these abominable mixtures. Serious illness and even death have frequently been caused by the use of articles containing the poisonous substances above mentioned.

Syrups flavoured with these essences are usually employed in the preparation of soda-water, a fact which certainly makes the use of this popular summer beverage exceedingly questionable on the ground of health. Candies also are flavoured with the same vile compounds, together with jellies, as before mentioned.

#### COMPRESSED AND POTTED MEATS.

Potted fish and other meats are often in a condition unfit for food when put up, and are further deteriorated by a peculiar kind of decomposition which is scarcely possible to discover by examination, but which often produces most serious consequences when the meat is eaten. This condition of the contents of a tin may be best determined before the tin is opened, by observing whether the end bulges outward or is drawn in. If there is bulging, the meat is bad. Tinned meats are often coloured for the purpose of hiding dirt, or to give the cooked meat a more lively appearance. All such meats are particularly unwholesome.

It has been discovered that large quantities of horses' tongues and flanks are worked up into potted meats as beef.

#### VINEGAR AND PICKLES.

Vinegar is very often adulterated with mineral acids—sulphuric acid being the one most commonly used. Many specimens of vinegar offered for sale as cider vinegar have not a drop of apple juice in them. Vinegar is itself an unwholesome article, but it becomes tenfold more injurious when adulterated with strong acids, injuring not only the stomach, but the teeth. The presence of sulphuric acid, or oil of vitriol, may be detected by the test given for this acid in syrups. It is said that it may also be detected in the following manner: Add to the vinegar a small quantity of sugar. Then put a drop or two on a clean plate, and evaporate at a low heat. If the acid is present, the spot will become black, through its action on the sugar.

The following is probably the best test for mineral acids in vinegar:—Pour into a test-tube, or small vial, two to four teaspoonfuls of the vinegar to be tested. Add twenty to thirty drops of a strong solution of salicylate of soda. If mineral acids are present, the salicylic acid will be separated from the soda and will appear in the form of curds. The salicylate of soda may be obtained at any chemist's shop. One drachm will be sufficient to test several samples of vinegar.

Pickles are, of course, liable to contamination with the same acid to be found in vinegar, and in addition are subject to a very dangerous form of adulteration—the addition of a salt of copper to deepen the colour. Very green pickles are sure to have more or less copper in their composition. The copper is sometimes added, but is more often derived from the copper kettle in which the pickles are made, through the action of the acid of the vinegar upon the copper. It is customary to make pickles in copper kettles for the purpose of giving them a green colour. Some cookery books even recommend that a few pennies be boiled in the kettle with the pickles for the purpose of "greening" them. The practice is not only a most absurd one, since it in no way adds to the flavour of the pickles, but it is very dangerous. Pickles are unwholesome and indigestible at the best; and when poisoned in this manner they become about the worst articles which can be put into the stomach. Copper and brass kettles should never be used in any way in connection with cookery.

The presence of copper in pickles may be easily detected by putting a clean, bright iron wire for a few hours into the jar containing them. If copper is present, it will appear as a thin film upon the wire.

#### LEMON AND LIME JUICE.

These valuable acids, sometimes preserved in the form of the juices of the fruits from which they are obtained, are not infrequently adulterated with sulphuric acid, which is intensely sour, and is also an active chemical poison. Sulphuric acid is not infrequently used by those who sell cheap lemonade at stands in our large cities, as it is a much cheaper acid than lemon. I have known of instances in which serious poisoning has occurred from drinking this kind

of lemonade which had been made in a zinc vessel, the poisoning being occasioned by the zinc.

#### CAYENNE PEPPER.

Though an unwholesome condiment, and not an article of food, cayenne is the subject of a dangerous form of adulteration. In order to add weight, ground rice and other substances are employed; and then, to produce the required intensity of colour, red lead and vermilion, or bisulphuret of mercury—both very poisonous substances—are used. I mention this fact as an additional inducement for abstaining from the use of cayenne as well as other condiments.

#### NASAL CATARRH.

UNDER the name of nasal catarrh, or chronic coryza, we refer to an affection ill-understood, ill-defined, characterised by a hypertrophy of the nasal mucous membrane, with or without secretion. The patient passes through alternating periods of easy and difficult respiration. The passages of the nose insensibly become closed, especially towards three or four o'clock in the morning. Thus are explained those obstructions of breathing which suddenly wake patients, chiefly children. Breathing through the nose was natural while they were asleep. Gradually the nose becomes obstructed by swelling of the mucous membrane; the secretions from this effectually completes the blocking of the passage. It is the same as when you apply a tracheotomy tube to an anaesthetised dog. Close the canula gradually, and the animal will make the greatest efforts at respiration; at any given moment he would wake, absolutely suffocated, struggling for air with might and main. Open the canula, and all becomes natural and peaceful. We know a traveller who suddenly wakes up at night, a prey to the greatest anguish, unable to breathe. He rushes to the window, and the paroxysm is over!

If the nasal passages close insensibly and gradually, they generally become clear quite suddenly; most frequently without any appreciable cause, or under the influence of emotion, cold, heat, certain powders (boracic acid, cocaine, menthol, tobacco). Most snuff-takers have chronic coryza, and take it to clear the nostrils. The patient is conscious of the sensation when they become clear. He hears a slight liquid noise, and the passage is open. If he lies on one side, this side becomes stuffed up, while the other clears.

Chronic coryza is present wherever there exist nasal polypi, decorations of the septum, vegetations on the septum, adenoid growths, enlarged tonsils. It is thus very important to examine the nose thoroughly in all cases of nasal catarrh, so as to arrive at a definite conclusion as to its cause. A mother whose child breathes with the mouth open is guilty of negligence if she does not consult a physician, but allays her conscience with the popular prejudice, so dangerous, that the child "will grow out of it."

In the treatment of nasal catarrh, the first thing is to keep the nose thoroughly clean. To remove the secretions, dust, &c., we utilise a nasal siphon, and wash out the nostrils night and morning with a powder composed of bicarbonate of soda, chloride of sodium, and borax, of each seven grains. This is to be dissolved in a half-tumbler of warm water, and passed into the nostrils by means of a tube. This nasal douche is not so much a medicament as a measure for keeping the nostrils absolutely clean. They can then be made accessible to any curative or alleviative medication which may be suitable in the eyes of the surgeon. If there are growths, &c., these may be removed by electrolysis, cauterisation, scarification of the mucous membrane, section of the septum, &c. All these operations may be performed without pain, without interfering with the occupation, or treatment in other directions. The important thing is, that they should be done by a skilled hand. To cauterise, to cut a membrane is not difficult, especially when the patient has no control over the affair, but to do it well is another matter; and the patient knows it as he waits, perhaps for hours, ill-affording, though not begrudging, the time that he may attend the man of skill and repute.

## A CHAT WITH DR. WALDO.

### HAMBURG AND THE CHOLERA.

DR. WALDO, the Medical Officer of St. George's, Southwark, and who is also Medical Officer to the Temple, is, as everybody knows, a specialist on sanitary matters, and even when on his holiday he cannot refrain from devoting the major part of his time to the prevention of zymotic diseases. The Doctor has just taken a holiday on the Continent, and he presented to the St. George's Vestry the other night an interesting report on the water supply of Hamburg, a subject which, he said, was interesting to Londoners, as Hamburg and its cholera-infected area is distant only a few hours from the Port of London. The matter which Dr. Waldo brought before the vestry was so interesting and suggestive, that I was induced to call upon him at his chambers in the Temple, and have a chat with him over a subject which just now has a special interest for Londoners.

Dr. Waldo told me that he had spent his annual holiday in Hamburg, Copenhagen, Gothenburg, Stockholm, Christiania, Bergen, and Newcastle. Although he had been able to make but a hurried examination of the water supplies and sanitary arrangements of these towns, he had learned many lessons of interest and value to Londoners. He had previously studied the insanitary conditions favouring cholera, and other water-borne diseases, during a six months stay in Hamburg immediate prior to the appearance of cholera in 1892.

"Things were very bad then," I said.

"Yes," said Dr. Waldo, "the raw, unfiltered and filthy water then in use for drinking and domestic purposes was drawn direct from the River Elbe, mixed with the untreated sewage from upwards of 80,000 inhabitants of the contiguous cities of Hamburg and Altona, to say nothing of towns further up the Elbe, as well as through the numerous canals filled with the filthy green partially-stagnating water connecting the Alita Lakes with the Elbe. These lakes still continue to contribute their quota of filth to the waters of the tidal and lockless Elbe."

"With, I suppose, the usual consequences?"

"Yes, the natural consequences. Typhoid fever and bowel complaints were markedly prevalent, especially among the more susceptible visitors."

"Was every opportunity given you to make investigations during your recent visit?"

"Certainly; through the courtesy of Herr Andreas Meyer, the energetic chief municipal engineer, I was given every facility to examine the new sand filtration waterworks of Hamburg. These were excellently constructed in a remarkably short time, and have all the recent improvements, consisting of four settling reservoirs and eighteen filter basins, each of the latter of which contains three metres depth of carefully cleansed Elbe sand overlying washed gravel and pebbles."

"Did this appear to be effective?"

"Yes; I remarked that the surface sand removed from the filters every few days was, as one would expect, very dirty, and had a distinctly fishy odour. The filtered water, without smell or taste, and to the eye as clear as a crystal, is conveyed from the filters to the old pumping-station by means of a channel coursing underneath the Elbe. A laboratory will shortly be utilised at the filter stations to examine bacteriologically, from time to time, the water as it issues from the filters."

"How about the service pipes?"

"Well, the old service pipes conveying the water to the dwelling-houses, and coated with Elbe mud, still remain in use, and continue to form an excellent bed for the cholera germ. I found drinking-water drawn from various parts of the city inferior in clearness to that given at the filtration station. Perhaps, in course of time, the pipes will be washed clear, but I would prefer to see the water examined bacteriologically as it issues from the house taps before I would venture to drink it in unboiled state. Judging from the houses I entered, I should say a large proportion of the drinking cisterns are still situated in dark unventilated water-closets, and, what is worse, the same cistern frequently supplies flush t

water-closet and drinking water; and this in the "flats" of poor and rich alike, in restaurant, café, and hotel."

"Are the people of Hamburg waking up to a sense of their responsibility in these matters?"

"They are. Taught a bitter and expensive lesson through former apathy and neglect, and the practice of a false economy, they have issued new sanitary police regulations regarding the periodical cleansing of cisterns, &c., and they are now very stringently carried out. Prior to the epidemic of cholera many of the cisterns in Hamburg were in the same uncleansed, filthy, and disease-breeding condition as those in some of our London parishes. Some of the Hamburg police regulations London might adopt with benefit. Hamburg has undoubtedly much work before her in the re-arrangement of the internal sanitary disposition of her "flats." Until she determines to cease from striving to convert sewage and polluted water into water fit to drink, and supplies in its place a pure and plentiful supply derived from some uncontaminated source, as from Holstein, so long will she be liable, in my opinion, to the scourge of cholera and other water-borne poisons."

Dr. Waldo told me a good deal more about his visit to Hamburg, and thoroughly convinced me that he had gained some experiences which he would utilise in his important sanitary work in London.

## QUACK DOCTORS.

By M. WILLIAMS.

THE recent prosecution of the Hindoo oculists at Richmond affords another illustration of the defective state of the law regulating the practice of surgery by foreigners in this country.

Quackery has existed in all ages, and at no time has it been more rampant than now. Carlyle has said that the population of the world is composed "mostly of fools."

Notwithstanding the frequent prosecution of these unregistered persons, the public, it seems, is quite as ready to place themselves in their unskilled hands, and to part with their money.

Despite the Medical Acts and the stringent regulations with regard to the compulsory registration of duly qualified practitioners, any breach of which renders a surgeon liable to have his name removed from the register, we have flourishing in our midst quackery of the most virulent kind. The reason of this is not far to see. In England the State does not grant a license to practise either medicine or surgery. These duties are delegated to various public bodies to whom charters have been granted empowering them to issue licenses to duly qualified persons. In France, however, they manage these things much better. The code Napoleon makes it a penal offence, out of which there is no chance of wriggling, for a person who is not licensed by the State to practise either medicine or surgery. The laws designed in this country for the suppression of quack practitioners can virtually do nothing in their present form to further this end.

According to the present state of the law, a man who elects to gain his living by practising surgery or medicine is permitted to dub himself by almost any title he pleases. He may call himself a "bone-setter," an "accoucheur," a "medical herbalist," a "surgeon-electrician," a "homœopathist," a "hernia specialist," and last, but not the least important, an "oculist." Indeed, he may practise in nearly every branch of the profession, provided that he does not lead the public to suppose by direct announcement, that he is "a duly registered qualified man." The law further permits him, as Dr. Critchett in his evidence clearly stated, to style himself an "oculist," and, in short, to perform operations on the eye so long as he does not call himself an "ophthalmic surgeon."

In other words, the law recognises his right to perform the hundred and one operations requiring the most careful diagnosis and skilful treatment by sheltering himself under the title of "oculist." The probability is that in most cases, therefore, the person thus describing

himself has not received the proper training which would enable him to diagnose the most common form of disease to which the eye is subject. While we have no intention whatever of prejudging the case of the Hindoos, who are committed to take their trial on the charge only of obtaining money by false pretences, the magistrates having acquitted them on the more serious charges—namely, of maiming and wounding—we think it right to direct the attention of the public to the wide field open under existing circumstances to unqualified persons to treat diseases with the nature and extent of which they are not in the least familiar.

So long as the Government gives its adhesion to this form of practising, and puts, as it were, its stamp of approval upon it, so long will scores of poor and credulous persons be found ready to be duped. That the law must be amended is certain if quackery is to be stamped out, and no person should be allowed to tamper with the eyes save those only who have made ophthalmic surgery a life-long study.

## UNDER GAS AT A DENTAL HOSPITAL.

By T. B.

I COULD stand it no longer. With a mouthful of purgatory, a cheek like a pumpkin, and an unholy unrest pervading my entire system, I felt that things must come to a climax, and that the battle royal which was being waged between my molars and my personal comfort must now or never result in a "draw." My financial resources being at a low ebb, I determined to encourage budding ability, and to that laudable end resolved to "patronise" one of our excellent dental hospitals. With Spartan fortitude, I sallied forth with the firm intention of "having it out" with that tooth, and—hear it, my septic friends—without gas.

Upon arrival at the hospital (not a hundred miles from Regent-street), I followed several other patients into a small room on the ground-floor, and by the direction of a consequential little man, who was seated at a table, sat down on one of the several benches ranged round the apartment. It was the function of this individual to take the name, age, address, and occupation of each patient as he passed before him, and upon entering the same in a large book you were permitted to again sit down and await your turn for transmission to the "stopping room" or the "drawing room," as the exigencies of your case required. After having my name, age, &c., duly entered in the hospital book, I had leisure to take stock of my surroundings and fellow-sufferers. There were at least thirty persons—men, women, and children—seated on the benches, the majority of whom were there for the first time; but a few were the happy possessors of appointment cards, which entitled them to first consideration at the hands of the dental assistants. Strange to relate, I could not perceive a face in the whole company which might lead me to suppose the person was suffering with the fell complaint of toothache. All were looking either utterly indifferent or were smiling and chatting with their neighbours, as if engaged in ordinary every-day business. Glancing round the apartment, I observed several notices to patients affixed to the walls, one to the effect that "We were not to expectorate on the pavement in front of the hospital," and others to the effect that "the institution was supported by voluntary contributions," and that "those who desired to have gas administered would have to pay 2s. 6d., or, "if gold was used in stopping, the patient would have to pay for same."

Just when I was beginning to discover, by a premonitory sneeze, that I was sitting in a very bad draft, the little man at the table, in a rather authoritative manner, notified that I could proceed upstairs to the "stopping-rooms" to ascertain whether I needed gas or not. Buoyed up with the courage of a fortnight's ruination and the desire to save half-a-crown, I almost laughed at the suggestion. I was a man, and free from silly fear. Had I not read that some philosopher or other had remarked (in an assinine mood) that "pain was not an

evil"; so, on the strength of that comforting assurance, I was about to assert my manhood and bluntly refuse to budge for such a purpose, when a prolonged howl of concentrated agony and pathos proceeded from the back premises of the hospital—a howl which penetrated my tympanum and shivered down my spinal column like an icy blast from the polar regions; my hand instinctively clutched a half-crown. I was not frightened—perish the thought!—but it suddenly struck me that if I had gas it would save the assistants a great deal of worry, and as it is ever my wish to spare others unnecessary trouble, I inwardly resolved to pay the money and make things easier for the students. I am not selfish. I have heard since that nearly all the men patients display the same tender solicitude for the operators, and spare them worry by submitting to gas.

On the other hand, it appears that most of the women refuse the anæsthetic—perhaps on account of the oft-remarked extra strength of "jaw" common to a great number of the fair sex—any way, they have a great objection to laughing-gas. After proceeding upstairs, and receiving an intimation from the house-surgeon that I had better have nitrous oxide, I descended to the waiting-room, paid my half-crown, and procured my ticket. I was then allowed to proceed to the chamber of horrors, which I found to be a dingy-looking room, curtained in two, in the back part of which was a bench to sit on until you were required behind the curtain. Taking my seat, I anxiously—I mean calmly—awaited the moment when "Next, please," would end the trouble.

Another piercing shriek, ending in guttural mumblings of woe, served to beguile the time pleasantly, and I felt quite "eager for the fray"; but, when the curtains were rent asunder, and a pale, dejected-looking girl staggered forth and, moaning hysterically, sat beside me, and murmured in an incoherent way in my ear that "they were cruel, cruel, and had torn her gum away," I felt I could almost smile. "Next, please." I looked round the room to see if anyone else had come in, for I felt I could wait longer just to study the *modus operandi*; but as I was the only person present "unoperated" upon, I unfroze from the bench, and advanced to my doom. An assistant came forward, took my ticket, and said, "Please, loosen your collar." Mechanically I did so. "Sit down here, please, and keep quiet." I sat down. The anæsthetist then approached, and felt the pulse in my left wrist, the while he timed it by his watch. Another assistant then placed a curious hollow instrument—shaped like a tea-cosy, and connected by an indiarubber pipe with the gasometer—over my face, and told me to take deep breaths. A hissing noise informed me the gas was being administered, and I began to take deep inspirations, whilst the anæsthetist still retained his grasp on my wrist. I heard him count to thirty, and then my surroundings suddenly vanished. I was in Oxford-street, engaged in a heated controversy with Mr. Gladstone. We both became excited, and in a torrent of abuse I wound up by asking him where he had buried the Home Rule Bill. This was too much for the G. O. M., and, lifting his celebrated axe on high, with a fiendish Irish "Hurroo!" he brought it down with a crash on my devoted head. "Lean on me," said the dental student, as he lead me, bewildered and minus my molar, to the bench in the back room; then, handing me a can of warm water to rinse my mouth with, he left me to my astonished reflections. I had felt no pain; in fact, the sensation was rather pleasant, and now it is all over I laugh heartily at the idea of the G. O. M. knocking my tooth out with the Hawarden axe.

I have had several teeth out since, and always under gas (I am ever considerate for others), and each operation has been quite painless; but upon each occasion some similar illusive dream has possessed me, and invariably the climax of the dream—a blow, a fall, or an explosion—has been the signal of return to consciousness and effective termination of my visit to the courteous surgeon and students of the Dental Hospital.—*Echo*.

LOVE him who tells thee thy faults in private.

BIRI of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

## FLUIDS WITH MEALS.

THE arguments presented by many writers seem to prove that the moderate taking of fluids with the food at meals is not without benefit. But the importance of the thorough mastication of food before it is presented to the stomach must never be overlooked. If this is interfered with in any way by the use of liquids, we must promptly prohibit their indulgence.

Fluids may be taken *ad libitum* during meals by those whose digestive powers will allow it, but such persons should keep in mind that the strongest stomach may be abused too far, while those whose stomachs are already unequal to a severe strain should be especially careful as to the quantity of fluid imbibed with the food.

The saliva is the best lubricator for the food while it is in the mouth, both because of its starch-digesting powers and because its alkalinity serves to stimulate a copious flow of the acid secretion of the stomach.

Any habit, therefore, which permits the entrance of food into the stomach before it is thoroughly incorporated with saliva must be pronounced pernicious in the extreme.

If we cannot afford the time necessary for masticating our food properly and incorporating it thoroughly with saliva it would be better to take nothing but broths and similar foods. The use of water and other liquids as lubricators is not to be tolerated.

On the other hand, if we bear in mind the whole mechanism of digestion, it will readily be seen that in cases of weakness or want of tone on the part of the muscles of the stomach, when every part of the food cannot be properly presented to the action of the digestive juices, the introduction into the stomach of a moderate amount of water may be of no slight benefit. The mass of food will become more pliable, and so more easily operated upon by the weakened muscles.

## THE CAMEL.

MISS AMELIA B. EDWARDS wrote the most appropriate description of that almost indescribable method of locomotion known as camel-riding. It may appeal to some of those more daring spirits we have seen with looks of ill-suppressed agony on their faces while a camel plays cup and ball with their unresisting forms. This is it:—

"The camel has his virtues, so much at least must be admitted, but they do not lie on the surface. My Buffon tells me, for instance, that he carries a water cistern in his stomach, which is meritorious. But the cistern ameliorates neither his gate nor his temper, which are abominable. Irreproachable as a beast of burden, he is open to many objections as a steed. It is not pleasant to ride a beast which not only objects to being ridden, but which cherishes a strong personal antipathy to the rider. You know he hates you from the moment you walk around him, hesitating where and how to begin the ascent of his hump. He does not hesitate to tell you so in the roundest terms. He swears freely while you are taking your seat, snarls if you but move in the saddle, and stares angrily around at you if you attempt to move him in any direction save that in which he himself intended to go. If you persist he tries to bite your feet. If biting you doesn't answer, he lies down. Now, the lying down and getting up of a camel are performances designed expressly to inflict grievous bodily harm upon the rider. Thrown twice forward and twice backward, punched in his "wind" and damaged in his spine, the luckless novice receives four distinct shocks, each more sudden and unexpected than the last. For this execrable hunchback is fearfully and wonderfully made. He has a superfluous joint somewhere in his legs and uses it to revenge himself upon mankind.

"His paces, however, are more complicated than his joints and more trying than his temper. He has four—a shot walk, like the rolling of a small boat in a chopping sea; a

long walk, which dislocates every bone in your body; a trot that reduces you to imbecility; and a gallop that is sudden death."

## WONDERFUL STRENGTH.

### THE ACCOMPLISHMENTS OF POLYDAMAS AND BARSABAS.

POLYDAMAS of Thessalia was a man of extraordinary strength and stature. As Hercules had done, he alone, without arms, killed an enormous lion that was devastating the valleys of Mount Olympus. With one hand Polydamas could hold back a chariot drawn by two horses. He could break the trunk of a tree as anyone would break a small stick. The King of Persia, Darius I., wishing to witness the feats of this marvellous man, called him to his Court; he opposed to him three of the stateliest men of his army. Polydamas killed the three by simply giving them a slap on the ears; he was about to slap the faces of a few more, when the king, satisfied, stopped him. One day he seized a bull by one of its hind feet, and the animal did not escape until it had left its hoof in Polydamas' hand. Like Milo, he died through over-confidence in his strength. He attempted to support a mass of rock that had given way, but he got buried under it and died.

Also, in the sixteenth century, there lived another remarkable strong man, a major, named Barsabas. One day he took up an anvil weighing five hundred pounds, and hid it under his cloaks. Often, to amuse his comrades, he went through the rifle drill with a cannon. He could crush between his fingers the limbs of big animals. One day, seeing a crowd looking at an enormous dancing bear, he offered to wrestle with the animal. The major threw the bear down several times, and, judging it unworthy of further struggle, slew the animal with his fist, and carried it away on his shoulders, amid the cheers of the crowd. Another day, seeing several officers of his regiment surrounded by an angry crowd, he ran to them, knocking people down right and left, as a child does with a pack of cards. The crowd, exasperated, turned round on him, but, seizing two of his assailants, one with each hand, he used them as clubs on the crowd, who, astonished at this extraordinary display of strength, quickly drew back. Once he squeezed to pulp the hand of a man who wanted to fight him.

## THE MANLY GIRL.

THE manly girl is one of the types of modern maids who help to bring discredit on the girls of to-day, and lead Mrs. Lynn Linton and other facile writers to dip their pens in gall when setting forth their attributes. She is, says the *Princess*, an exaggeration of our nineteenth century damsels, and as such is hopelessly unpleasing; the athletic maiden, fond of every sport, is as lovable as she is vigorous, but let her beware lest she overdoes her part, and stamps herself as disagreeably masculine, in which case she may count surely on losing the respect, the reverence, and the chivalrous treatment which every right-minded man gives to a true woman. When she makes her *début* in society, the childish roughness, instead of disappearing, develops into an uglier form. The slangy talk and pert replies to which she has treated her brothers are fairly piquant to her partners, and as they smile and jest in return, she becomes more and more manly, with the mistaken idea that she is conveying a good impression. She begins to speak of men as her "chums," and votes them very "good fellows." A cigarette, first indulged in purely out of bravado, is followed by a second and third, till nausea being overcome she commences to indulge fairly regularly in the "weed"; so the innocent, refined bloom of maidenhood is roughly brushed, and the manly girl finds herself addressed more cavalierly and treated with greater indifference than the girl

who has been true to her sex. The pity of it is that the manly girl, in her short-sightedness, thinks she is attracting where, in truth, she is repelling. Let no girl believe it that a man likes a woman who seeks to be his counterpart, who copies him with a stiff shirt, a tie, a jacket, and a waistcoat, retaining only the skirt as a means of identification, who crops her hair close, perches a sailor hat at an angle on it, screws up her eye, and inserts a single glass (not without a contortion of the rest of her face), and with a stick under her arm, swaggers (it is the only word possible here) down the road. The caricature may amuse, but the laugh in truth is against the girl, not with her. In each bright young girl, full of life, vivacity, and freshness, a thinking man looks for the qualities that will make a true wife, a thoughtful mother, and a beloved companion; in the horsey young lady, with her cigarette and her slang, her loud voice and strident laugh, and her general unwomanliness, he sees none of the attributes with which his ideal woman is clothed, and he turns away from her to seek the one whose "price is far above rubies," for "she will do him good, not evil, all the days of her life."

## SEVEN SCOLDING WIVES.

HAZLITT's wife cared nothing for his abilities and kept him in hot water by her temper.

Boswell's "Uxoriana" is a collection of his wife's sayings to him, which does no little credit to her abilities as a scold.

Ben Jonson's wife went to the inn after him if he staid too long and brought him home, tongue-lashing him all the way.

Farquhar, the dramatist, thought he was marrying a rich, talented, and amiable girl, and when asked about her declared that he had got "a scold, who carried her wealth on her back, and her intellect on her tongue."

Jean Paul Richter's wife was jealous and was constantly on the watch to catch him in some flirtation. She generally succeeded, and when she did, always threatened to leave him. He told her to go and she never did.

Addison's wife, the Dowager Countess of Warwick, would not allow him to go to the inn at all unless he sat by the window where he was in plain view of her from her front room. Every absence from his post had to be accounted for.

Dante was married to Gemma Donati, a woman of stern, imperious temper. He was hectorated and bullied day and night until his exile, which was, in this respect, for him a fortunate occurrence. He does not mention Gemma in any of his writings.

## THE "ELIXIR OF BEAUTY."

THE plainest features have a priceless beauty when they are covered with a pure, velvety, transparent skin. It is the recognition of this fact which leads so many of our women to attempt the enhancement of such charms as they have in this direction by the employment of means and methods which too often lead to irreparable ruin instead of greater loveliness. Powders, cosmetics, lotions, and balms are applied by the barrel in the attempt to preserve or restore the waning attractiveness, or to simulate that which has never been in the possession of the unhappy one. All this is effort in the wrong direction.

The best cosmetics are of a very prosaic composition, and cannot be bought at a chemist shop. For the benefit of our readers the secret may be whispered here—and the formula will be found efficacious. The first and indispensable ingredient is good digestion, insuring pure blood. Plain, nutritious food, regular hours, and physical exercise will generally secure this element, without the assistance of the medical fraternity. The exercise, especially, should never be overlooked. It need not be taken in such a manner or at such times as to expose the features to sunburn or freckles, but plenty of physical exercise should be had in some manner, and so varied as to stimulate and develop all the muscles of

the system. A healthy, well-balanced organisation will be the result, with a vigorous, happy frame. This topic might be carried much further, and include the dispelling in this manner of a multitude of the ills with which womankind are afflicted, but that is not the present purpose.

Another ingredient of this "Elixir of Beauty" is thorough cleanliness. It is related that one of the most famous beauties of ancient times that the charm of her complexion dazzled all beholders, but it was not till after her death, at the age of 90, still beautiful, that it was disclosed that her only chemical application was soft water, thoroughly applied every day. This efficient cosmetic is still available, and its power is no wise lessened. If soft water cannot be had, any water can be made soft by the addition of a few drops of ammonia or a little borax. It is to be feared that there are many who use plenty of water, but neglect the important item of soap. Some, indeed, have an almost superstitious fear of applying soap to the face.

## GLEANINGS FROM FAMOUS AUTHORS.

**THE TEACHING OF CIRCUMSTANCES.**—God puts us in the midst of a whole apparatus of tests, that those tests may bring to light that which is in us; for it is absolutely true that feelings may now be lurking in us, just as there is fire lurking in the flint-stone, which may remain there from the days of creation undetected and undeveloped till the genial steel strikes upon it; and then, when the blow of the steel brings to light the long-concealed fire, we are amazed to find that in that cold mass there could have lurked a thing that was so vivid and so sparkling. All this is that great teaching, that marvellous discipline of circumstances! For, after all, it is not by direct teaching, it is not by explanation, that men ever learn to know themselves; it is by the wretched and by the painful instruction of circumstances.—*A. K. H. Boyd.*

**NATURAL HISTORY.**—The study of natural history indeed seems destined to replace the loss of what is, not very happily I think, termed "sport;" engraven in us as it is by the operation of thousands of years, during which man lived greatly on the produce of the chase. Game is gradually becoming "smaller by degrees and beautifully less." Our prehistoric ancestors hunted the mammoth, the woolly-haired rhinoceros, and the Irish elk; the ancient Britons had the wild ox, the deer and the wolf. We have still the pheasant, the partridge, the fox and the hare; but even these are becoming scarcer, and must be preserved first, in order that they may be killed afterwards. Some of us even now—and more, no doubt, will hereafter—satisfy instincts, essentially of the same origin, by the study of birds, or insect, or even infusoria—of creatures which more than make up by their variety what they want in size.—*Sir John Lubbock.*

SINCE every man who lives is born to die,  
And none can boast sincere felicity,  
With equal mind what happens let us bear,  
Nor joy nor grief too much for things beyond our care;

Like Pilgrims to the appointed place we tend;  
The world's an inn, and death the journey's end.  
—*Dryden.*

## EASTON'S SYRUP.

WHENEVER this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Sold in 4-oz. bottles, 1s. 6d.; 8-oz. bottles, 2s. 6d. 16-oz. bottles, 4s. 6d.

## OUR OPEN COLUMN.

### CORRESPONDENTS' OPINIONS.

#### THE CHARM OF PRETTY EARRINGS. TO THE EDITOR OF THE FAMILY DOCTOR.

DEAR SIR,—The interesting discussion that formerly had place in your paper on the subject of the "Wearing of Earrings" seems to have ceased entirely. I am quite sure this is from no lack of interest on the part of very many of your subscribers on this subject. Will some one kindly answer the following questions:

1. Is the piercing of the ears only a fashion, or has it beneficial actions of any kind? 2. Is the habit dying out, as some say, or has it recently revived? 3. Why should English women have the ear-lobes pierced so near the bottom edge? 4. Why should jewellers make the ear-wires so thin that the lobe is deformed by the weight of the pendant? 5. Are parents justified in persuading their children to have their ears bored?

Personally, I would wish to see all women wearing this adornment, and I believe one reason why the custom is not more general is, that at one time vulgar patterns of earrings obtained and disgusted artistic tastes. The new French patent fastening is free from this objection. If men showed that they approved of the fashion our ladies would soon respond, although I believe that many women refrain from fear of the pain and inconvenience they imagine would have to be undergone. Now on this point I am in a position and say positively that the prick of a pin is infinitely more painful than the passing of a piercing instrument through the lobes. If the person be moderately healthy, the slight redness caused does not last more than four or five days. From observation in the streets, and at gatherings such as concerts, &c., I believe the fashion is again coming in. I sincerely trust this is so. Young girls are rendered more attractive by wearing the small gold hoops or rings usual for unmarried persons, and, granted that the custom is "barbaric," that to men constitutes a principal charm. We want some such fashion as a set off to the masculine girl.—*Yours, &c.,* CHALLOCK.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

**TAWES WANTED.**—Can any of your readers kindly inform me where I can procure the tawes recommended by "H Beauchamp" a few weeks ago? Also where I can procure a few neatly-made birch rods suitable to use on young children?—*"Ada."*

**WILL "Mrs. H. Sinclair" who put an advertisement in the FAMILY DOCTOR of May 11th, 1889, in reply to "Young Stepmother," send address to "Emulation," whose address is with the Editor?**

**A REMARKABLE STORY OF TIGHT-LACING.**—Will "Alice" of Kensington kindly inform me whether this boy's ears were pierced by his aunt to wear gold sleepers therein?—*"Patience Gregory."*

### ANSWERS.

**RENT.**—You owe the rent, admittedly, amounting to £5. Having paid off a fourth part, you still owe the balance, £3 15s., book or no book, and to advance this as a bar to the claim is of no practical utility; if you are summoned for it, you will have to pay it, and the costs attending the action. Make up £2, go to the landlord, plead your poverty, and ask him to accept this and give you quitance.

**BUSINESS.**—From your statement it would seem you ended the transfer or settlement, and any documents containing conditions of former occupants can in no wise affect you, if you have not entered into similar or endorsed those handed to you.

**WILL.**—All depends on the terms of the will, if the trustees are to sell an equal monetary division will no doubt be made; if not, and the others prefer the estate as it is, you cannot compel trustees to pay you out as you would like, but must take it as bequeathed.

## FAILING EYESIGHT.

Thirty years' practical experience has proved Mr. Bluett's system of sight testing by examination of each eye separately to be the only perfect method of accurately determining the lenses required to restore the vision, and make reading or working a pleasure.

Consultations Free. Spectacles at Store prices.

**F. J. BLUETT,**

Specialist in Spectacles, and author of "Defective Vision, its Cause and Cure."

8A, GT. PORTLAND STREET, LONDON, W.  
(FOUR DOORS FROM OXFORD STREET.)

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR OF THE FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

### ADVICE GRATIS.

By A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS their ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

### The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:

King's College Hospital.	Nazareth House, Ham-
University College Hos-	mersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

## Not That Way Now.

People used to take plain cod liver oil for coughs, colds, throat and lung troubles only after other remedies had been tried and found wanting.

## Scott's Emulsion

is the modern idea of cod liver oil, the first instead of a final resort, when such ailments appear. The fish-fat taste is removed and the oil itself is partly digested before taken into the stomach.

Prepared by Scott & Bowne, Ltd., London.

Sold by all Chemists and Vendors of Medicine at 2/6 and 4/6.

## "MALT-COFFEE"

(PATENTED.)

"The FAMILY DOCTOR contains useful Hints on Medical Subjects."—*Sunday Times.*

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Does not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much further than any ordinary coffee; therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin.

MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

# DISINFECTION.

## KINGZETT'S

(PATENT)

### SULPHUR FUMIGATING CANDLES ARE PERFECT

And afford the best means of Preventing and Arresting the Spread of Cholera, Fevers, and all Infections by Fumigation with Sulphur.

They can be lighted with the greatest ease, and burn steadily and thoroughly.

**THE SANITAS CO., LTD.,**  
BETHNAL GREEN, LONDON.

(Sole Manufacturers also of the famous "Sanitas" Disinfectants.)

**F. THORNTON.**—We think a good deal of your trouble is due to indigestion and constipation. We should advise you to keep the bowels freely open, and avoid beer and spirits, also much walking and standing about. Your diet must be light and nutritious. You ought to have some local treatment for the local trouble, but it must be of a peculiar nature, electrical being preferable. Your stomach will not allow of the ordinary specific medicines being used. Take the following: Acid tartrate of potash two drachms, infusion of chiretta to six ounces. One-sixth part three times a day.

**ONE IN TROUBLE.**—You are suffering from prostatic hyper-nesthesis the result of former bad habits. We do not think that medicine alone will be of much service to you. Local electrolytic treatment would be of most service, but you may meanwhile test the effect of the following mixture: Bromide of potassium twenty grains, bicarbonate of potash fifteen grains, tincture of hops half a drachm, camphor water to half an ounce. To be taken three times daily between meals. You should also learn to use a gum elastic bougie (No. 9 English) twice a week, retaining the instrument in position for two minutes on each occasion of using. The chemist will tell you how to pass the bougie.

**WILLIAM CAMERON.**—Yes, you have chronic indigestion with corresponding liver disturbance. The sexual troubles are in part dependent upon these causes—in part upon your time of life. Take a teaspoonful of sulphate of soda in hot water each morning before rising, continue the mixture and wait patiently, remembering that you must still give attention to your diet, avoiding coffee, sugar, beer, tobacco, and indigestible meats. Take as much fresh air exercise as possible, and persevere, for from four to six weeks longer.

**JAMES H.**—Scabies is easily cured by the application of ordinary sulphur ointment. The difficulty lies in removing all sources of contagion which are likely to re-infect the patient time after time. It is not sufficient to wash, or even to boil, clothing; baking occasionally suffices, but it must be very thoroughly done, and there is the risk of scorching the materials. Books, gloves, trousers pockets may all convey contagion. You had better purchase and carefully read a lecture on scabies (price sixpence), published by Messrs. Ralliere, Tindall, and Cox, Medical Booksellers, 20, King William Street, Charing-cross, written by one of the late physicians to St. John's Hospital for Diseases of the Skin.

**CARNARVON.**—We do not think your trouble is due to indigestion at all. It is suggestive of a condition known as "writer's cramp." In your case, of course it would be called telegraph operator's cramp, due to the too constant use of the same muscles, and the consequent nerve and muscle exhaustion. You had better consult one of the physicians at the Hospital for Paralysis and Epilepsy, (Queen's Square, Bloomsbury, in order that an accurate diagnosis of the condition may be made.

**ARLIT.**—This is not an easy malady to relieve; but you had better try the following for a week or two: Tincture of perchloride of iron twenty-five minims, tincture of belladonna twenty-five minims, glycerine forty minims, chloroform water to two ounces. A desiccating cause is the likely trouble you mention. Take the following medicine: Bicarbonate of soda two drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day between meals.

**KING.**—There is certainly hope for you, but we cannot enter into this subject in these columns. Send a stamped addressed envelope, and we will advise you if you re-enumerate your symptoms remind us.

**PELVAN.**—We cannot go into the matter very fully on account of the nature of your query. Neither can we explain the curvature you refer to without examination, though it is very probably not of a serious character. Be very careful to keep the bowels freely open and take plenty of active out-door exercise. When you go to bed, be careful to avoid sleeping on your back, as that is a very common cause of the difficulty you mention. Take the following medicine: Bicarbonate of soda two drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day between meals.

**GOOD HEALTH.**—We should like to know what colour your would like to have this or not pink? Would your eye be better pleased if it were blue or green? Do not listen to ignorant chatter.

**VERY ANXIOUS.**—If the fits are epileptic in nature, there is of course certain cause for anxiety. But there is no proof that they are so. It appears to us that you have fainted off from sheer want of blood in the brain. We think, however, it would be far better for you to see some good doctor in your vicinity, who can go into your condition and examine you personally. Without knowing the exact nature of the fit it is difficult to make any suggestions.

**W. H. NICHOLAS.**—Take a cold bath every morning, and get plenty of active out-door exercise during the day. Refrain from all beer, wine, or spirits, and also from much farinaceous food. Eat green vegetables and lean meat, boiled fish, or fowl. Keep the bowels freely open by means of a four grain colonic powder once a week, followed by a seidlitz in the morning. Take the following: Sulphate of magnesia two drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day.

**JAMES F.**—Your bad breath is probably due to either carious teeth, a foul tongue, or an ill-smelling discharge from the nostrils, called ozena. You have spoken too generally for us to be able to advise you satisfactorily as to the remedy for your condition. For instance, you do not mention what form of disease you suffered from years ago, nor if any other efforts have been left by it. Use a good tooth powder of precipitated chalk, with some carbolic acid in it, and rub your teeth with a soft brush dipped in this powder after every meal. Keep the bowels freely open by means of three or four grains of calomel twice a week at bed-time, followed by a seidlitz dose of salts in the morning. Take the following: Liquor potassae one drachm, infusion of chiretta to six ounces. One-sixth part three times a day between meals.

**DOOMED.**—Where do you get the pain you complain of? In any case, the apparatus you refer to is not likely to do you any good. Again, you must not suppose that because you have sugar in your urine that you are therefore suffering from diabetes. The best course for you is to see some good doctor, and have yourself watched and properly treated.

**SNEEZER.**—We should recommend you to take a teaspoonful of the ammoniated tincture of quinine three times a day in a wineglass half full of water. Use as a snuff into the nose: one drachm of carbonate of bismuth, with one grain of morphia, and one grain of cocaine. Mix well and snuff up occasionally. You need not necessarily, however, discontinue using the lotion already recommended to you. Eat well, dress warmly, keep the bowels freely open, and take plenty of active out-door exercise.

**A. BURGIS.**—There is no particular necessity to make any alteration in your diet. Endeavour to get plenty of rest at the periods, and take the following medicine: Bromide of potassium one drachm, liquid extract of salix nigra two drachms, compound spirit of sulphuric ether two drachms, camphor water to six ounces. One-sixth part three times a day. As a general tonic, you should always take a teaspoonful of Parrish's Food three times a day, immediately after meals.

**PERPLEX.**—With regard to what you call the "Bling substance" in your eye, we should advise you to get a little white vaseline from the chemist, and smear it over the edges of the eyelids when you go to bed at night. The pimples on the skin are a very common symptom in boys of your age, and are simply due to changes in the constitution as it develops into the adult. The bowels should be kept freely open, and a cold or tepid bath taken every morning, soap being generously applied over the entire body surface. Avoid smoking to any excess, and let your meals be taken regularly and consist of light and nourishing food, such as boiled fish or chicken, with rice or pearl barley. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

## DUNN'S FRUIT SALINE

This PURE preparation is a quick relief for Sick Headache and Derangement of the Stomach and Liver. Purifies the blood and is delightfully refreshing. Through Chemists and Stores. SPECIAL OFFER.—To prove its efficacy, 1s. 9d. bottle will be sent post free for 1s. 6d. stamps. Works: CROYDON, LONDON.

**FERRUM, V.**—You are thinking too much about yourself; throw all these advertised remedies away, they are of no use whatever. The best thing you can do is to place yourself under the care of a good doctor; if you do not know of any send a stamped addressed envelope and we will tell you to whom to go.

**NOTTINGHAM.**—We should like to know something of the local conditions; however, as that is not possible we should advise you to make an effort not to pass water when this feeling comes on; it is the only way in which you can cure the condition, otherwise you will become a perfect slave to the habit, and your life a misery. No harm can accrue from withstanding the inclination, but, on the contrary, considerable benefit. Take the following medicine: Citrate of potash two drachms, tincture of nux vomica half a drachm, chloroform water to six ounces. One-sixth part three times a day. Avoid all beer, wines, and spirits.

**T. C.**—Dentistry is out of our sphere; we are afraid we cannot tell you of any particular man in your part of the world. You had better go back to your own dentist if he has satisfied you before.

**TEBSON.**—If it is very small, unquestionably the most advisable thing for you to do is to prevent its getting any larger, by wearing a well-fitting truss, this will probably not cure it, but it will keep it up. Unless this is done, the opening will become larger, the hernia more bulky and painful, and a precarious operation will have to be performed. You had better see Atkinson, 7, Mill Street, Hanover Square, London.

**NORTHWALLIAN.**—Refrain from all local treatment for the present, and give the parts a rest. Avoid much walking and standing about, keep the bowels freely open, and take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, bromide of potassium one drachm, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day, immediately after meals. If this does not cure you, you had better come to town again, sending a stamped addressed envelope.

**ALFRED T.**—You have quite omitted to tell us what your ordinary diet is, but if you have a tendency to looseness you should avoid liquid in any shape, except in very small quantities. If you find that fruit and green vegetables have a tendency to aggravate this condition, then we hope your own common sense would suggest the advisability of discontinuing their use. Farinaceous food, if well cooked, you may eat freely of, as that may have a tendency to cause what you desire. You had better take the following medicine: Dilute nitric acid half a drachm, sulphate of quinine six grains, chloroform water to six ounces. One-sixth part three times a day immediately after meals.

**J. B. HOLMES.**—We are sorry that we cannot give the name of a physician in these columns, but shall be happy to comply with your request on receiving a stamped addressed envelope, reminding us of what you wish. As you say, it would be absurd to prescribe for such a condition without seeing it, more especially as you have been for many months under the care of medical men.

**J. C. T.**—Unfortunately you are not the only sufferer from the results of bad practices, who has wasted both time and money on quacks. See reply in these columns to "One in Trouble," and follow out the directions given to that correspondent. You must remember that the effects of years of unnatural excitement cannot be cured at once, and you will have to exercise patience and perseverance with treatment, if you wish to be permanently relieved.

**J. H.**—The only thing we can suggest is that, you should get more comfortable and better fitting boots. You do not say anything about your general health, so we cannot advise you, but it is as well to bear in mind that swelling of the feet is a complication of diseases of the heart, liver, lungs, and kidneys. Be careful to keep the bowels freely open.

**E. DEAR.**—You had better rest a little while after your meals, and take the following medicine immediately after the meal: Dilute hydrochloric acid one drachm, tincture of nux vomica half a drachm, spirit of chloroform one drachm, water to six ounces. One-sixth part three times a day immediately after meals.

**CEDRIC.**—It appears to us that you are suffering from dyspepsia or an analogous condition. We should advise you to have a cold or tepid bath every morning, and to get plenty of active outdoor exercise during the day. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. You should play football or whatever the seasonable game may happen to be, as much as you can, and take the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia three drachms, spirit of peppermint one drachm, chloroform water to six ounces. One-sixth part three times a day between meals.

**SINCERITY.**—You do not say whether there is any lump to be felt, you do not say whether the doctors have examined your heart; and you do not say whether the pain is worse after food. Try the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, chloroform water to six ounces. One-sixth part three times a day immediately after meals.

## THE CURE OF CONSUMPTION

**CHRONIC BRONCHITIS, ASTHMA, & CATARRH.**  
By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S., Late M.R.C.S. Eng., late Consulting Surgeon to the Lower Clapton Orphan Asylum, &c., Lynton House, Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—Daily Chronicle.

**NO. 15.**—You have omitted timentation your age. We should advise you to take the following medicine: Bromide of potassium two drachms, syrup of oranges two drachms, chloroform water to six ounces. One-sixth part three times a day.

**FURNACE.**—If you are affected as often as you say—that is, three times a week—there must be some strong reason for it, and the reason probably is that you do sleep on your back, although you say you do not. You had better get some hard substance, and tie it in contact with your back so that when you lie on your back you may be awakened. Use plenty of soap and cold water as a local tonic, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and followed the next morning by a mild dose of aperient fruit salts. Electrical treatment is the only beneficial local treatment that can be employed.

**WILLIAM EDWARDS.**—Take a cold bath every morning, and use plenty of soap all over the body. Get plenty of active outdoor exercise during the day, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and followed the next morning by a mild dose of aperient fruit salts. Have your meals regularly, and let them consist of plain, nourishing food. Take a teaspoonful of Parrieh's Food three times a day immediately after meals.

**HOPEFUL.**—This redness of the nose may be due to a great many varied conditions, and unless we know a great deal more about your general state, facts about which you can give us no information, we are unable to satisfy you on this matter of treatment. We cannot sympathise for you in having spent money in consulting herbalists and botanists: you might just as well have consulted a greengrocer. The very best thing you can do is to go and see one good doctor who will advise and treat you scientifically.

**CUMBER.**—The diagnosis of nervous disease is very difficult, even when one has had an opportunity of examining the patient. Your symptoms as described do not justify us in classifying your case at all, as they may be attributable to one of many conditions. At sixty-nine there are so many troubles possible that we hesitate to give at the pathological state, and consequently to write a prescription for a state which at present is to us, quite indefinite.

**CAREFUL.**—Bicycling is just the very thing to cause this feeling, combined with constipation. The probabilities are that if you entirely discontinue bicycling, and are careful to keep the bowels freely open, you will no longer be troubled with this affair. Take also the following medicine for a time: Must two drachms, infusion of buchu to six ounces. One-sixth part three times a day between meals. We do not think you have a varicocele.

**E. BRETT.**—Yes; your doctor is right in saying you are suffering from indigestion. This has been aggravated by the unsparring indulgence in the cigarette. Your remedy will be to eat less, to eat slowly, to drink only after meals, and to give up smoking entirely. The following mixture taken half an hour after each meal will be of service: Bicarbonate of soda twenty grains, sulphate of magnesia half a drachm, infusion of gentian to half an ounce.

**T. C. R. (L. Edmont.)**—Take after each meal the mixture ordered for "E. Brett." Eat your food slowly and drink only after each meal is finished. The following pill daily with dinner will help you: Blue pill one grain, pill of colocyth and henbane three grains, compound rhubarb pill one grain.

**CELLIARMAN.**—We certainly think that this pain in the head of which you speak has something to do with your not being a teetotaler. You must try also to get out into the open air more, and obtain some active form of exercise. Keep the bowels freely open by means of four grains of calomel taken once or twice a week at bedtime, followed the next morning by either a sedlitz powder or a small dose of Epsom salts. Your food must be light and nutritious in character, and taken regularly. Take also the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day.

**DESPERO.**—However uncommon your personal history may be, the history of your complaint is exceedingly common. There are methods by which you can regain your cheerfulness and vigour, but their employment will necessitate your staying in London, and being regularly treated. What will do you more good than anything is the judicious application of electricity; but it is of no use your having it applied anywhere. If you like to send a stamped addressed envelope we can recommend you what to do and to whom to go.

**JACK HINTON.**—You must avoid all beer, wines, and spirits and refrain from stimulating food, such as sauces, &c. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Take thirty grains of citrate of potassium three times a day.

**W. L.**—You are quite correct in your supposition that the trouble is due to indigestion. You must eat your food very slowly, drinking only after meals, avoid coffee, sugar, and preserved foods, and take the following mixture after each meal: Bicarbonate of soda twenty grains, bromide of ammonium fifteen grains, tincture of capsicum five minims, tincture of gentian twenty minims, water to half an ounce. Keep the bowels acting regularly with a daily dose of compound liquorice powder (one teaspoonful), and use only hot water for washing purposes.

**W. L. H.**—You had better bathe the eyes frequently in cold water during the day and apply some ordinary white ointment to the edges of the eyelids before going to bed at night. Keep up your general health by taking a teaspoonful of Parrieh's food three times a day immediately after meals.

**J. NEWMAN.**—This is a quite unnecessary query. If you are a medical student you will easily find out what books are in use by your colleagues. If you are not yet entered, it will be quite time enough to get the books gradually as you require them. It is useless to buy all the books at once, before you know whether you will ever want them.

**FORWARD.**—You should take a cold bath every morning and get plenty of active outdoor exercise during the day. Take the following pill every night, and follow up next morning with a sedlitz powder. Blue pill one grain, sulphate of quinine one grain, powdered rhubarb one grain. To make one pill, to be taken every night. Avoid all beer, wines, and spirits, and refrain from eating too much sugar or fat. Take the following medicine: Acid tartrate of potassium two drachms, infusion of chiretta to six ounces. One-sixth part three times a day between meals. Of course it is your liver which is out of order.

**NO. L. LEEDS.**—Leave the boy alone. He does not require medicine, and will probably grow out of all the troubles you name. 2. Your own condition is, as you suggest, dependent upon excessive indulgence. Cut it down as quickly as possible to once or twice a week. Take the following mixture twenty minutes after each meal: Brouide of potassium twenty grains, bicarbonate of potash twenty grains, tincture of gentian half a drachm; water to half an ounce.

**LUCK.**—1. The answer to your question depends upon the conditions of your heart. If your heart is sound, chloroform would undoubtedly be preferable. 2. A feeling of partial intoxication, added to a suggestion of suffocation, or, if you like, of choking.

**EBORACUM.**—The doctors apparently agree in the definition of your disorder, though they use different terms to apply to the same complaint. You are suffering from indigestion, which is probably the result of eating your food too quickly. Our advice is: Eat your food slowly, drinking only after the meal is finished, and take the following mixture: Dilute sulphuric acid twenty minims, hyposulphite of soda five grains, tincture of nux vomica five minims, tincture of gentian half a drachm, water to half an ounce. Three times daily between meals.

**J. SMITH.**—You should take a cold bath every morning, using plenty of soap well rubbed on all over the body with rough washing gloves, apply this treatment especially to the face. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and to the next morning by a mild dose of aperient fruit salts. You must avoid all beer, wines, and spirits, and stews, sauces, too many vegetables, too much smoking, &c. Take the following medicine: Acid tartrate of potash two drachms, infusion of chiretta to six ounces. One-sixth part three times a day between meals.

**M. WILTON.**—You should have persisted with the treatment, taking, under the circumstances, a smaller dose—say half—than that ordered for you. The result that followed was to be expected, and should have been in every way beneficial.

**S.W.**—We do not understand in what way a burn could have caused fleshy development of your chin, and we are inclined to think that without any burn at all the fat would have shown itself all the same. You give us nothing in the way of description of the growth to enable us to make a diagnosis, or we should have been glad to prescribe for you. You may try the effect of the following mixture, taken three times daily, an hour before meals: Solution of potash (liq. potasse pur.) ten minims, glycerine twenty minims, infusion of buchu to half an ounce.

**KITTY.**—Yes, the alum solution is useful. You may add a teaspoonful of powdered alum to half a pint of warm water, dissolve, and bathe the part immediately after washing. Allow the solution to dry on the skin.

**BURNLEY.**—This is due to the pressure on the veins in the abdomen. Nothing can be done except for her to lie prone as she can in bed with the feet up. The bowels must be kept freely open.

**CHAL.**—The drinking of chalky water predisposes to the development of gouty and rheumatic conditions with chalky formations; therefore, it is not good for people suffering with these complaints to drink this water habitually.

**LUCY.**—The best thing you can do is to take the following pill: Blue pill one grain, sulphate of quinine one grain, powdered rhubarb one grain, the pill to be taken every other night at bedtime, followed the next morning by a mild dose of aperient fruit salts, this is better for you than compound liquorice powder, as it acts more on the liver. You must avoid beer, wines, and spirits, and refrain from indulging too freely in tea. Take the following medicine: Acid tartrate of potash two drachms, infusion of chiretta to six ounces. One-sixth part three times a day between meals.

**E. W. S. W.**—The probabilities are that you sleep in a draught all night. Hence this noise in the ears, and if you have your mouth open while asleep, this condition will be greatly exaggerated. You must get out of the draught and sleep with your mouth shut.

**CAMP.**—Miss a fortnight with the pills: take instead a teaspoonful of Epsom salts each morning in water; continue the mixture and ointment. You appear to have made good progress, and we have no doubt you will presently feel quite well again. We regret, however, that no earthly power can guarantee lasting freedom from piles. The utmost we can do is to suggest care in diet and other matters.

**DOMBEY.**—It will be necessary for you to take aperients at regular intervals, instead of doing so spasmodically. Try each morning a teaspoonful of sulphate of magnesia, added to half a teaspoonful of sulphate of soda, and dissolved together in a tablespoonful of hot water. Take neither sugar, coffee, nor beer. Eat your food slowly, and do not smoke. R. — You must keep your bowels acting regularly; eat your food slowly, taking neither coffee, beer, nor sugar, and a dose of the following mixture night and morning: Bromide of potassium twenty grains, tincture of hops half a drachm, glycerine twenty minims, camphor water to half an ounce, and you must not marry until you are free from the troubles named.

**CLAUDE.**—The pimples are termed "acne." You must wash your face in hot water, using good soap, such as Cleaver's or Vinolia. Rub the part thoroughly after drying, and apply some Haumometes ointment afterwards. Take also the following medicine before each meal: Dilute hydrochloric acid ten minims, sulphate of soda twenty grains, tincture of cardamoms half a drachm, tincture of gentian half a drachm, water to half an ounce. Three times a day before meals.

**THELMA.**—You had better take one of the Bipalatinoids (No. 500) three times a day with your meals. You should take them during alternate months for a year at least. 2. There is no reason why you should not continue taking the oil as well as the iron, though for a considerably shorter period.

**W. B.**—We do not know the cause at work in your case, and are therefore unable to judge whether the drugs ordered would be of any service. We should think they would not help you much, but except that the dose of glycerine would be much too large as ordered, the mixture would not be likely to do you any harm.

**D. A. A.**—We are glad to hear so good a report of the inflammatory trouble. Continue that treatment until all traces have disappeared. 2. Syphilis properly and systematically treated is distinctly curable, especially when the case is taken early. The best proof of that consists in the fact that a man after proper treatment may acquire a subsequent infection. The writer has treated more than one such case, through two distinct attacks of syphilis (from primary start to termination of disease), proving thus beyond the possibility of doubt that syphilis can no longer be classed amongst the incurable diseases. Brodie as a syphilographer is somewhat antiquated, and there are new and better methods than the plan advocated by him. Meanwhile, until you have fully described your exact condition, take six grains of iodide of potassium with twenty minims of solution of perchloride of mercury in half an ounce of infusion of gentian three times each day.

**XXX.**—We have had much difficulty in deciphering your letter. We would advise you to persevere with the mixture already prescribed. Take one of the following pills each night at bedtime: Blue pill one grain, pill of colocyth and henbane three grains, compound rhubarb pill one grain; and each morning before rising a teaspoonful of Epsom salts dissolved in a small quantity of hot water.

**J. C. K.**—It certainly would be better to see someone, but we cannot mention names in these columns. Send a stamped addressed envelope, and we shall be happy to advise you.

**MRS. HEARD or HEALD.**—Your writing is illegible, we cannot guess even the purport of your letter.

**BROWN FACE.**—We are unable to give an opinion upon your son's condition without seeing him. You say he is brown under the eyes, but have omitted to mention whether the rest of his face is brown or not, or as to his general complexion. If he complains, take him to a doctor, but otherwise it would be better to leave him alone.

**W. D.**—Your letter, though rather long, was legibly written, and quite clear. No doubt that the chief cause of your heart beating so wildly occasionally is that you suffer from indigestion, probably brought on by your past habit of drinking. Therefore You must be very abstemious in that respect now, and be very particular about the hours and character of your diet. We should advise you to eat boiled fish or poultry, lean underdone meat, but not too much vegetable food. Take a fair amount of regular gentle exercise every day, but do not strain yourself in any way. Be careful to keep the bowels freely open and take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, chloroform water to six ounces. One sixth part three times a day immediately after meals.

**EARL.**—He must be got into an asylum for idiots. Let the relieving officer of the parish be communicated with, and a doctor certify idioy, and he can be removed.

## A WONDERFUL MEDICINE. Beecham's Pills

**ARE** universally admitted to be worth a Guinea a Box for Bilious and Nervous Disorders, such as Wind and Pain in the Stomach, Sick Headache, Giddiness, Fulness and Swelling after Meals, Dizziness and Drowsiness, Cold Chills, Flushings of Heat, Loss of Appetite, Shortness of Breath, Costiveness, Scurry and Bloches on the Skin, Disturbed Sleep, Frightful Dreams, and all Nervous and Trembling Sensations, &c. The first dose will give relief in twenty minutes. Every sufferer is earnestly invited to try one Box of these Pills and they will be acknowledged to be

### WORTH A GUINEA A BOX.

For females of all ages these Pills are invaluable, as a few doses of them carry off all humours, and bring about all that is required. No female should be without them.

For a Weak Stomach, Impaired Digestion, and all Disorders of the Liver, they act like magic, and a few doses will be found to work wonders on the most important organs in the human machine. They strengthen the whole muscular system, restore the long-lost complexion, bring back the keen edge of appetite, and arouse into action with the rosbud of health the whole physical energy of the human frame. These are FACTS testified continually by members of all classes of society, and one of the best guarantees to the Nervous and Debilitated is BEECHAM'S PILLS have the Largest Sale of any Patent Medicine in the World.

### BEECHAM'S MAGIC COUGH PILLS.

As a remedy for Coughs in general, Asthma, Bronchial Affections, Hoarseness, Shortness of Breath, Tightness and Oppression of the Chest, Wheezing, &c., these Pills stand unrivalled. They are the best ever offered to the public and will speedily remove that sense of oppression and difficulty of breathing, which nightly deprive the patient of rest. Let any person give BEECHAM'S COUGH PILLS a trial, and the most violent Cough will in a short time be removed.

Prepared only, and sold Wholesale and Retail, by the Proprietor, Thomas Beecham, St. Helens, Lancashire, in boxes 9d., 1s. 1d., and 2s. 6d. each.

Sold by all Druggists and Patent Medicine Dealers everywhere.

N.B.—Full directions are given with each box.

A MEAL to be carried in the WAISTCOAT POCKET.

**FRAME FOOD TABLETS**

Sustaining and Invigorating.

INVALUABLE for TRAVELLERS, CYCLISTS, ATHLETES, and for all who require a temporary substitute for a regular Meal.

DR. NANSEN has ordered a quantity for his NORTH POLE EXPEDITION.

The specially sustaining qualities of these Tablets are due to "Frame Food" Extract, containing ten per cent. of soluble Wheat Phosphates, which nourish Frame, Brain, and Blood.

Sold by Chemists, Grocers, &c., in 6d. and 1s. Boxes, or sent post free for 8 or 13 stamps by

**"FRAME FOOD" Co., Ltd., Lombard Road, Battersea, London, S.W.**

# "FOR THE BLOOD IS THE LIFE."

"CLARKE'S BLOOD MIXTURE is entirely free from any poison or metallic impregnation, does not contain any injurious ingredient, and is a good, safe, and useful medicine." ALFRED SWAINE TAYLOR, M.D., F.R.S., Lecturer on Medical Jurisprudence and Toxicology.

"The Hon. Surgeon to his EXCELLENCY THE VICEROY OF INDIA prescribes 'Clarke's Blood Mixture' largely, and speaks highly of its efficacy in skin affections, &c. On this account we wrote asking if you could supply the Mixture for dispensing purposes."

Letter from A. JOHN and Co., Chemists and Druggists, Agra, India, June 5th, 1888.

CLARKE'S WORLD-FAMED BLOOD MIXTURE is a guaranteed cure for all blood and skin diseases. It is the most searching blood-cleanser ever discovered, and it will free the system from all known blood poisons, be they animal, vegetable, or mineral. As it is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, from infancy to old age, the proprietors solicit sufferers to give it a trial to test its value.

Skin Diseases, Eruptions, Blotches, Spots, Pimples, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scuffs, Discolorations of the Skin, Humours and Diseases of the Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

How is it that CLARKE'S BLOOD MIXTURE has obtained such great popularity? is a question which has perplexed many. The answer is that it is unquestionably the finest Blood Purifier that science and medical skill has brought to light, and thousands of wonderful cures effected by it have stamped it as one of the most extraordinary discoveries of modern times.

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the world; or sent to any address on receipt of

33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN.

"7, Canonbury Park North, London, N., Jan. 13, 1892. "I had a very bad arm for eight or nine months, and had medical advice which did not benefit me much. I met a gentleman at the Crystal Palace, and he told me a friend of his had a carbuncle on his leg, and that your Blood Mixture cured him right out. He advised me to try it, which I did, and after taking four 2s. 9d. bottles I am glad to tell you the place healed quite up, and I have not felt anything of it since. "I have no objection to your publishing this cure.

"Yours faithfully, A. BONNER. "Lutton-road, Long Sutton, Lines, July 27, 1891.

"I received your letter of the 22nd. The testimonial you saw in the paper is quite true. My leg was bad about five years, and I thought I would try a bottle of Clarke's Blood Mixture, and did so, and, to my great surprise, my leg got on wonderfully well, and is just as well as the other one. The book which is wrapped around the bottle will show you how to go on. It is best to get a case of the mixture, 11s. Clarke's Blood Mixture is worth its praise. I can't recommend it too highly. I am sure it will do your leg good. I have much pleasure in writing this letter to you, because it is a medicine worth buying. It is a great boon to any sufferer. "Yours truly, PHILIP BALES."

Ask for **CLARKE'S** World-famed **BLOOD MIXTURE**, and do not be persuaded to take an Imitation.

## THE PATENT MASTICATOR

## EDITORIALS.

**TOO MANY DOCTORS.**—We have not too many doctors. If the number were less, the standard of professional attainments would be lowered rather than raised, and the grand workings of that fundamental law, sublime in its severity, "the survival of the fittest," would be seriously interfered with, to the final detriment of both the profession and the people. Only the lower steps of the ladder of professional eminence are crowded, and those who have sufficient courage to continue the ascent, however steep and difficult it may prove, will surely find recognition and success awaiting them at the summit.

**CEREBRAL CONGESTION.**—A person suffering with cerebral congestion should never sleep with the head low. There is already too much blood in the head, and if the power of gravity is added to the natural tendency of the blood to the head, the difficulty is increased. When the head is raised, the blood naturally recedes from it; the heart has to pump the blood against gravity, and the consequence is, the lower part of the body will have a little more blood than the upper part. So the best position for persons who have a flow of blood to the head, is to raise the upper part of the body. This does not mean to raise the head by a pillow or bolster, but to raise the whole upper part of the body; let the bed be raised to an incline. The effect of raising the head only is to compress the superficial veins of the neck, so that the blood cannot readily return. During sleep the head should not be raised above the level of the shoulders, but the whole upper part of the body should be raised. In the opposite condition, as for instance when a person faints and the blood recedes from the head, the opposite effect should be produced, and the head should be lowered; but let the effect always be produced by different inclinations of the whole bed, and not by the use of pillows under the head, as is usually done.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

**BURNS.**—A doctor has this to say about the the treatment of burns in general:—"Burns are always painful, but the most painful ones are not the most dangerous. A circumscribed deep burn is less dangerous than a superficial burn covering an extensive surface. The rule in burns and scalds is to exclude the air as soon as possible. This is generally more readily accomplished by wrapping the burned part with gauze or cotton soaked in oil. Cloths wrung out of a solution of 'baking soda' or boric acid are said to relieve the pain promptly. A dressing of flour can usually be obtained at once, and answers as a temporary dressing. The dressing should be allowed to remain on as long as possible. All blisters should be pricked, and their fluid contents allowed to escape. Burned fingers should not be allowed to touch each other. In the treatment of any burn the utmost cleanliness should be observed. Maturation from burns is no more necessary than from any other wound. They should be dressed antiseptically. This can be easily accomplished by having the oil used slightly carbolicised. Carbolicised, or iodoform, or bi-chloride gauze should be used."

**EAT BEFORE GOING TO BED.**—Most students and women who are troubled with insomnia are dyspeptic, and they should, therefore, eat before going to bed, having put aside work entirely at least an hour before. If they are not hungry they should simply be instructed to eat, and if they are hungry they should eat whatever they want. A glass of milk and a biscuit is sometimes all that can be taken at first, or mashed potato buttered. If possible, the night meal should be taken in another room than the sleeping apartment, and for men in the city it will be found advantageous to go out to a restaurant. Before eating, however, a bath should be taken, preferably cold or cool, which should be given with a sponge or stiff brush, and the body thoroughly rubbed off with a coarse towel afterward. The bath need not be more than five minutes in duration. Further than this, the patient should go to bed at the same hour every night, and arise the same hour every morning. There is a popular superstition, that grown people should not eat immediately before going to sleep; that it will give them indigestion or nightmare, or both. The writer cannot see why adults should be so very different in this respect from babies. The average person should be in bed seven or eight hours, which is time enough for the digestion of almost anything edible.

**THE WEDDING TRIP.**—The French medical journals have been lately calling attention to the evils of the wedding trip. There are few physicians who will not recall many cases in which a girl, perfectly healthy till her marriage and a long wedding trip, is never healthy again. The number of women who date a life of chronic invalidism to a wedding trip is small. So apparent have been these evils that it is reported a custom has arisen by which the demands of fashion for a wedding trip shall be complied with, and yet the newly-married couple enjoy a period of repose and quiet all by themselves. The plan is to make ostensible arrangements for a trip, and even drive to the station, but in reality turn back to a hotel, or some intimate friend's, in which, all alone by themselves, the newly-married couple shall begin their life journey. Marriage is one of the epochs of life. It is peculiarly related to the physical well-being of both parties and to the unborn. To the young wife, there has been long and exhaustive excitement in arranging for the event. To this is added an entrance upon physical relations utterly new to her. Surely this is quite enough to bear in the retirement of a quiet home, or away from inquiring acquaintances. Surely this is enough without the discomfort of railway travel, the exhaustion of hurrying from place to place, the excitement of new scenes and people, and the exposure to extremes of heat and cold, of storms and all sorts of annoyances inseparable from long journeys. We have often thought that physicians, by giving a word of friendly advice to such of their patients as chanced to be about to enter upon a married life, might be the means

of saving such persons from future misery. Family physicians are the ones to reach these cases. True, they would have to combat social customs, but after all we think that in the end they would win.

**PHYSICAL SINS.**—Perhaps nothing will so much hasten the time when body and mind will both be adequately cared for, says Herbert Spencer, as a diffusion of the belief that the preservation of health is a duty. Few seem conscious that there is such a thing as physical morality. Men's habitual words and acts imply the idea that they are at liberty to treat their bodies as they please. Disorders entailed by disobedience to Nature's dictates they regard simply as grievances, not as the effect of a conduct more or less flagitious. Though the evil consequences inflicted on their dependents and on future generations are often as great as those caused by crime, yet they do not think themselves in any degree criminal. It is true that in the case of drunkenness, the viciousness of a bodily transgression is recognised; but none appear to infer that if this bodily transgression is vicious, so, too, is every bodily transgression. The fact is, that all breaches of the laws of health are physical sins. When this is generally seen, then, and perhaps not till then, will the physical training of the young receive deserved attention.

**A MEDICAL CONGRESS AT SEA.**—The art of making holiday is well understood by many persons, and the methods of business probably by a still greater number. The faculty of combining both pursuits without injustice to either is, however, more difficult of exercise, and it is consequently less often witnessed in successful operation. An experiment, says the *Lancet*, which is to be carried out by the Norwegian Medical Congress at its next annual gathering possesses a special interest in this connection. At the meeting recently held in Christiania it was decided that next year members will assemble on board a yacht, which will cruise during their deliberations. A more reasonable, salutary, or, on the whole, economical arrangement could hardly have been arrived at. It remains to be seen if the work of the Congress will be carried out with the same regularity and application as it would be under existing conditions. This is the only point as to which we are at all doubtful. The project is certainly worth a trial. Several circumstances combine to render a holiday at sea—especially when passed, as in summer it usually is, amidst favourable weather—a highly enjoyable means of recreation. The holiday-maker can then freely partake of the purest and richest atmosphere that lungs can breathe, physical exercise within deck-limits may be taken in greater or less measure at the option of individuals, whilst the hours of sleep, walking, meals, and occupation may be observed with a minimum of irregularity. All this, coming as the healthy sequel of months, or perhaps years, passed in effort, weariness, and worry, confers upon the pleasure voyage to sea a charm and utility which only those can appreciate who have known this happy experience of navigation. Some discretion must of course be employed in the selection of season and weather, but these being favourable, we know of few more agreeable modes of release from the cares of medical practice than that proposed by the Norwegian Congress. With a service of well-appointed vessels continually visiting our shores, expenses are reduced to a minimum and facilities and comfort are increased in proportion.

WHERE thou hast touched, O wondrous death!  
Where thou hast come between,  
Lo, there forever perisheth  
The common and the mean.

No little flaw or trivial speck  
Doth any more appear,  
And cannot from this time, to fleck  
Love's perfect image clear.

Clear stands love's perfect image now,  
And shall do evermore;  
And we in awe and wonder bow  
The glorified before.

—Archbishop Trench.

The Family Doctor is Carefully Edited and meets a want that has been long felt."—*News of the World*.

## OUR UNBIDDEN GUESTS.

## THE PARASITES OF MAN.

By Dr. NAGALCAM.

## Article I.—TAPEWORMS.

(See *Frontispiece*.)

## PARASITES IN GENERAL.

MAN, in his many varieties and diverse habitats, is the unwilling, or unconscious, host of great numbers and many kinds of parasites. Some of these, like the flea and the louse, live on the surface of his body; others, like the *Trichina spiralis*, bury themselves in his muscles or connective tissue. There are species which float in the blood stream, giving rise to strange and obscure illnesses; other species, inhabiting the intestinal canal, which scarcely make their presence felt by any symptoms at all. Some have fixed positions and a limited life, while others may wander through the body, and eventually find a resting place for years, in almost any organ or structure. Of the latter kind, we have an example in the *Echinococcus*, which, commonest in the liver, may occasionally be found in its characteristic bladder-like home anywhere in the body—from the great toe to the eye or brain. Some parasites are peculiar to man, disdaining a meaner host; many, however, are not so exclusive, and are found also in dogs, cattle, or even fish. Some are born, live, and die in one individual; others must pass through the bodies of two individuals, sometimes of widely-different species, to complete the cycle of their existence. There are parasites which only affect the black races of man, and parasites which can only exist under a white skin. A few are confined to particular regions of the earth's surface, being under the influence of climatic conditions; but the majority are widely spread, geographically, and are chiefly affected by the dietetic habits of their hosts. The more common of them are, happily, under our control, and can be destroyed or ousted from their position by appropriate means; a few, and perhaps the most dangerous, still defy the resources of medical science.

Parasites vary greatly in size. The cyst, formed by the echinococcus in the liver, may reach the size of a football. Tapeworms may be many yards in length; but the great majority of parasites are scarcely visible to the naked eye, and are formidable rather on account of their number than of their size.

## TAPEWORMS.

Among English people the tapeworm, because of its size, the frequency of its occurrence, and the serious symptoms to which it is supposed to give rise, is looked upon as typical of the class of parasites. There are few families of which one or two members has not harboured a "worm"; and nearly everyone is acquainted with the appearance of the white, segmented creature hanging in ornamental festoons in a bottle of spirit, and exposed in a shop window to demonstrate the skill of some "herbal doctor." It is fitting therefore that we should commence a popular account of the parasites of man by describing the tapeworm.

The tapeworm is one of that class of parasites which requires to pass through the bodies of two hosts to complete its life, and leave behind eggs of a new generation. Generally these two hosts are of different species. For instance, the common tapeworm of England passes the first half of its existence in the muscles of the pig; the second, and as we may call it, the adult period of its life, is passed in the intestine of a human host. This, however, is not invariably the case. Man enjoys the unique distinction of serving as a suitable host for both phases in the life of this parasite.

We will commence our description with the adult worm as it exists in the intestine of man. Here it is a long, flattened creature, often of several yards in length, consisting of short quadrilateral segments, joined together as shown in D, in the illustration. If we trace

these segments upwards towards the head of the worm, we find them growing smaller, shorter, and broader in proportion to their length. This diminution in size continues until we reach the neck, which is nearly as slender as a sewing needle, and the segments so crowded together as to be indistinguishable. The head of the worm is about the size of a pin's head. A, B, and C in the figure shows the head of different species, enlarged; a, b, and c, the head, neck, and commencement of the body, of the actual size. The head is provided with suckers and teeth, or hooks, by means of which it fixes itself to the mucous membrane of the intestine. At the other end of the worm the segments are of the largest size. One is shown, enlarged, in E. It will be seen that it is occupied by a branched canal, which opens by a small orifice at the middle of one edge of the segment. This is the uterus, and in the large segments, at the end of the worm furthest from the head, is filled with the minute eggs. The segments are then said to be ripe; and when in this condition, detach themselves one by one, or several together, from the rest of the worm, and are passed out of the body with the feces.

We must now follow the fortunes of these eggs, and see how some of them develop into new tapeworms, in some other unfortunate sufferer. The majority of them no doubt perish, but a few become mixed with the soil and vegetable matter. Suppose that we are dealing with the commonest species of tapeworm in England, the *tænia solium*. The eggs of this tapeworm can only develop further when they are swallowed by a pig. When we remember the feeding habits of these animals, eating as they do all sorts of vegetable matter, semi-decayed and mixed with dirt, it is easy to understand how some of the eggs of a tapeworm may get into its stomach and intestines. Once there, they are soon hatched. The little embryo worm, armed with six sharp hooklets, enters upon a very active period of its life. It penetrates the walls of the intestine of the pig, and wanders away through its tissues. Its final resting-place is usually the muscles or lean part of the pig's flesh. Here it surrounds itself with a little bladder-like sheath, not much larger than a small pea, and remains at rest. The first half of the cycle of its life is completed, and it can develop no further until the flesh of that pig is eaten by man.

A pig, if it swallows any at all, usually swallows a considerable number of tapeworm eggs. Hence its body is invaded by hosts of the little embryos, and its flesh is studded by their little cysts. Although they select the muscles by preference, yet they may develop in almost any part of the body. If they are not very numerous, they may pass unnoticed, and the flesh may be used for the food of man. If it is first thoroughly cooked, of course the little cysts with their contained embryo worms (technically called *cysticercus cellulosæ* or *scolex*) are destroyed; but if the infected pork be eaten in some uncooked or only partially cooked form, such as ham, or sausages, the cysticercus may be received into the human stomach in a living condition. An opportunity is then afforded it of entering upon the second half of its cycle of existence.

Suppose, however, that the tapeworm's egg, instead of being swallowed by a pig, as usually happens, gains access in some extraordinary way to the stomach of a man. Here they behave just as they do in the pig. The egg is hatched, and the embryo worm, or scolex, wanders off into the tissues, finding at last a resting-place, and building around itself its little bladder or cyst. If it should settle down in some muscle, or other comparatively unimportant organ, no harm results. It lives from three to six years, and then dries up into a little chalky granule.

But this harmless ending is not by any means universal. Instead of a muscle, it may establish itself in some vital organ, such as the heart or brain, and thus lead to the death of its host. They have been many times observed in the eye, causing partial or complete blindness.

The cysticercus of the tapeworm which has invaded man finishes its life in his body. It cannot have any chance of developing further. In its commoner habitat, however, the flesh of the pig, it is more fortunate. The imperfectly-cooked pork is dissolved by the gastric juice of

the human stomach and the cyst is ruptured, setting free the scolex. This straightway attaches itself to the mucous membrane of the upper part of the intestine by means of its suckers and hooks, and begins to grow. It increases in length by the addition of new segments near the neck, pushing the old ones down, which increase in breadth and length—but faster in length than in breadth—until the adult tapeworm, yards in length, is formed. The cycle is now complete, and commences again by the formation of eggs in the branched canal of the segments, and the shedding of these when ripe.

## SYMPTOMS OF TAPEWORM.

It must be understood in the first place, that tapeworms may, and frequently do, exist without giving rise to any symptoms whatever. They undoubtedly cause a great variety of symptoms, which will be mentioned below, but not in every case; and not any of them are pathognomonic—that is, enable us to say certainly that the complainant has a tapeworm. There is, indeed, only one certain sign of tapeworm, and that is, to find segments or portions of the worm in the stools.

Persons who have a tapeworm, or who imagine they have one, are frequently nervous, and hypochondriacal; they suffer from pains in the abdomen, of a colicky nature, constipation, or diarrhoea, or each alternately. Loss of appetite is common, but sometimes the appetite is enormously increased, the patient always feeling faint in spite of the quantity of food ingested. There is often lowness of spirits, and unfitness for exertion, and great loss of flesh.

The irritation which tapeworms may set up in the intestinal canal is sometimes responsible for various reflex symptoms, such as dilated pupils, itching at the nose, constant flow of saliva, headache, sickness, &c. In rare cases they have even caused convulsions and chorea.

## TREATMENT OF TAPEWORM.

An immense number of remedies have been used against tapeworms. Those chiefly used at the present day are: Kousso, pomegranate, root bark, oil of male fern, Kamala, oil of turpentine. Whatever anthelmintic is used must be preceded by a purgative and period of abstinence from food, and followed by a purgative. Unless the head comes away the worm will grow again. The dose of the drug, the purgatives used, and the length of the fasting, all require to be varied with the individual nature of each case, and the directions of the medical man must be strictly followed. Self drugging is not to be advised.

## THE THREE SPECIES OF TAPEWORM.

## Description of Illustration.

- A. Head of *tænia solium*, enlarged.
- a. The same, actual size.
- D. Part of the middle of the *tænia solium*, actual size.
- E. One of the segments enlarged, showing the branched uterus containing minute eggs.
- L. Egg of *tænia solium*, magnified.
- The *scolex* of the *tænia solium* lives in the muscles of the pig. The adult worm reaches a length of from seven to twelve feet.
- B. Head of *tænia mediocanellata*, enlarged.
- b. The same, actual size.
- i. Egg of *tænia mediocanellata*, enlarged.
- The *scolex* of this worm lives in the flesh of the ox, and as uncooked beef is not so commonly eaten as pork, the corresponding tapeworm is rarer. It is longer than the *tænia solium*, namely from 10 to 13 feet.
- C. Head of the *bothriocephalus latus*, enlarged.
- c. The same, natural size.
- F. A few segments from the middle of the worm. They are much broader and shorter than in either of the other species.
- g. Egg of *bothriocephalus*, after having developed partly in sweetened water.

It is then swallowed by fish, and the *scolex* is formed in their muscles. This tapeworm therefore comes from the eating of infected fish. It is found in Holland and part of Switzerland, in East Prussia, in Hamburg, and parts of Russia. It is the longest of the tapeworms, reaching in length of from 20 to 25 feet.

MANY a man thinks he is looking at truth when he is only looking at the spectacles he has put on to see it with.—*Diamond*.

## SOME THERAPEUTIC PROBLEMS AWAITING SOLUTION.

COMPLAINTS are frequently made regarding the backwardness and slow progress of therapeutics. In view of the complexity of the phenomena which are involved, the wide range of individual idiosyncrasy and the impossibility in many cases of instituting anything in the nature of exact experiment, it is possible that these complaints may be a little unreasonable. No one doubts that rapid and brilliant progress is continually being made in our knowledge of the pathology and the clinical history of disease, and when the conditions of the question are fairly considered it will not seem surprising that therapeutic progress should follow rather than precede advances in pathology and clinical medicine. However this may be, it is desirable that we should from time to time review our position regarding some of the as yet unsolved or imperfectly solved problems of medicine. Time leaves little unchanged, and even in the absence of any notable experiments or discoveries, it will always be found that we are from year to year insensibly altering our attitude towards the great therapeutic controversies of our age. Experience always teaches something, even if it be only caution and scepticism, and every day facts arise which tend either to confirm or to undermine provisional theories and working hypotheses. Truth prevails very slowly and error is as slowly expelled; but the intellectual atmosphere is ever changing. Doctrines that seemed to be probable a decade ago appear to be hardly worth contending against to-day. Theories that gave a passing satisfaction to the thoughtful physician of the last generation seem to be strangely outworn to-day, although little may have been accomplished in the way of tangible disproof.

We may find illustrations of our remarks in such diseases as syphilis, phthisis, pneumonia, diphtheria, and typhoid fever. It is not so long since the revolt against the abuse of mercury was in full swing, and had gone so far that certain accomplished observers maintained that some of the worst features generally attributed to the disease were really due to the remedy. Now we feel that this question has passed out of the sphere of serious discussion. With a practical unanimity we acknowledge the value of mercury, and the only problems that await solution in this connection are the proper form of the drug to employ in a given case, the correct dosage, and the mode of administration. Phthisis affords a more difficult case. For the present, treatment by inoculation stands condemned, and it is not likely to be generally revived unless more extensive and authentic evidence of its utility than that which first gave it vogue is forthcoming. We have not, however, yet finally determined whether the antiseptic treatment of phthisis is as sound in practice as it seems to be plausible in theory. The use of antiseptic inhalations, though much less general than it was a few years ago, still holds its ground to some extent. We would commend to the profession the determination of the following question, which lies at the root of the problem. Supposing it be granted that bacilli are the cause of phthisis, and that their destruction is the legitimate object of the efforts of the physician, is there any evidence to show that an antiseptic solution or vapour can reach the seat of the disease in sufficient strength to effect this object? We fear that, for the present, at least, there is no such evidence; and without discouraging further experiment we very decidedly deprecate the use of inhalers and inhalations which are theoretically indefensible and manifestly ineffective. Then, again, with reference to the

THE OPINION OF EVERY ENGLISHMAN is that liberty of speech and action is the birthright of every free man. "Britons never shall be slaves" is one of the most popular of our national songs, and, as a matter of fact, it is impossible for slavery to exist under the protecting shadow of the British flag. In the same manner, men cannot remain bound by the tyrannic shackles of disease, if they will place themselves under the healing influence of Holloway's Pills and Ointment. Their success in all parts of the world is now a familiar story, and it is only necessary to say here, there is no known disorder that cannot be speedily cured or relieved by them.

same disease, much advantage would arise from the diffusion of more definite views regarding the different effects of the various sanatoria upon its progress and palliation or cure. The high altitudes, the ocean voyage, and the desert air are all known to possess considerable efficacy, but, although the literature of the subject is rapidly increasing, it cannot be said that the profession generally has assimilated the opinions of experts on these subjects.

Pneumonia is still more or less of an opprobrium to the therapist. Vigorous stimulation still commands the approval of the great majority of adherents, but thoughtful physicians can hardly repress a doubt as to whether it is universally applicable, and whether a place might not still be left for venesection and antimony. Sweeping generalisations in medicine are hardly ever true, and the time may come when greater therapeutic distinctions will be drawn between the different types of case, to the great advantage of the patients. Then we need further to make up our minds whether cardiac failure is really the chief source of danger in pneumonia, and, if it be so, whether we have made sufficient use of our great cardiac tonic, digitalis.

It is not so long since one of the great battle-grounds of practical medicine was the identity or non-identity of laryngeal diphtheria and membranous croup. This question has never been authoritatively settled, and although the doctrine of identity has tended to prevail, somehow or other the question has lost its interest, and we have come to see that its practical importance had been over-rated. What is certain is the clinical fact that a membranous affection of the larynx is excessively dangerous, and in young children is very frequently fatal. In view of these clinical facts, the question of the precise pathological character of the membrane in the different cases becomes of minor interest. More important are the questions whether the removal or destruction of the membrane is ever advisable, and when tracheotomy should be performed. The former question is now usually answered in the negative; and the latter raises one of the most difficult points in therapeutics, and one which is further rendered perplexing by the fact that foreign experience seems to be at variance with our own.

As regards the last disease on our list—viz., typhoid fever—we greatly need more authoritative teaching and more defined views on two questions: firstly, is intestinal antiseptics the legitimate aim of treatment, and if so which of the numerous antiseptics is the most suitable one? and, secondly, is antipyresis generally advisable, and if so are we to trust to medicinal antipyretics, or to the cold bath? To discuss these questions adequately would take us beyond our present limits, but we commend them to the thoughtful attention of our readers. We may merely suggest that intestinal antiseptics is still upon its trial, and that as regards antipyresis British practitioners have perhaps unduly neglected the external application of cold.—*Lancet*.

## RECENT PATENTS.

This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.

- 17,976. A new or improved liniment or embrocation. C. G. HAWKES, London. September 25th, 1893.
- 18,177. Skin specific. G. T. HALL, Plumstead. September 28th, 1893.
- 18,179. Improvements in invalid carriages. J. S. PRICE, Southwick.
- 18,313. Improvements in and relating to artificial teeth. R. WESENDANGER, London. September 29th, 1893.

## SPECIFICATIONS PUBLISHED.

- 18,780. ZIMMERMAN. Artificial teeth (10d.), 1893.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 6d. and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 3s or 13s stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

## DOCTORS' FEES IN RUSSIA.

MUCH diversity of opinion is likely to arise in connection with the astonishing ukase just issued by the Czar regulating, and restricting within certain narrow limits, the fees demanded by medical practitioners for their services. By many, says the *New York Tribune*, it will be considered as one of those paternal pieces of autocratic legislation—few and far between—which, in a certain measure, palliate and excuse despotism. But by the doctors themselves it is bound to be regarded in the light of an act of unwarrantable interference and outrageous tyranny, thoroughly in keeping with the persecution of the Hebrew race, and other phases of Muscovite barbarism. According to the decree in question, the population of the Empire is divided into three separate classes, the one composed of the nobles, the capitalists, the landowners, the manufacturers, the bankers, the principal merchants, and members of the first six classes of the civil, military, and naval service. The second class comprises lawyers, parsons, and professional men of one kind and another, as well as Government employés of the seventh and eight grades; while class number three consists of the balance of the population. For patients belonging to the first class the fee is limited by law, and under severe penalties, to five roubles, about 11s., for each consultation; those forming part of the second class are instructed under no circumstances to pay more than three roubles, while the cost of medical advice to the masses is limited to 30 kopeks, or 10d. Should this law be enforced, as the Czar has expressed his determination of doing, it will necessarily involve the ruin of many of the leading physicians at St. Petersburg and Moscow, who have been accustomed to charge and to receive, not five or three rouble or 30 kopeks, but hundreds and even thousands of dollars, for a single consultation. Of course, it will be optional for patients to give expression to their gratitude for medical care by paying much larger fees, but the doctors will be henceforth debarred from presenting any claim for compensation in excess of the sum prescribed by the ukase.

DR. BOTKINE.

It may be taken for granted that this ukase would never have been issued had old Dr. Botkine been still alive. He was the favourite and most trusted physician of the late Czarina, and as such stood high in the good graces of her son, Alexander III. The doctor's regular fee for a consultation was 100 roubles at his own house, while he demanded five times that sum for any professional visit at the residence of a patient, if it happened to be within calling distance of his own house. He made up for the heaviness of his charges to the rich by his benevolence to the poor, whom he treated for nothing. One day he was visited by the late Prince Demidoff, who was as mean and as avaricious as he was rich, his wealth surpassing that of any nobleman or commoner in Europe. After having prescribed the necessary remedies, Dr. Botkine noticed that Prince Demidoff had extracted two five-rouble notes from his pocket-book, and that he was about to tender them in payment of the consultation. "Thanks, no; nothing at all, my dear Prince!" he exclaimed, in the most kindly, and even affectionate manner. "You ought to know that I never exact any fee at all from the poor." And with that he bowed the Prince out. A curious story is told at St. Petersburg of the circumstances that led to his appointment at Court. The late Empress, beside being afflicted with consumption, suffered from disease of the heart. Like many other invalids, she was convinced that the physicians in attendance failed to understand her case, a state of things due rather to the extraordinary modesty on the part of Her Majesty than to any ignorance of the doctors, as she could not be prevailed upon to permit them to examine her chest in the ordinary manner.

DOCTOR AND THE CZARINA.

Ever on the look-out for a physician who could comprehend her case, she readily granted permission to one of her ladies-in-waiting to present to her a young, and at that time unknown doctor named Botkine. He came and created

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch*.

a most favourable impression upon Her Majesty, until the moment when he asked her to remove the bodice of her dress in order to enable him to examine her chest. She at once refused to comply, adding that all the physicians who had attended her until then had prescribed for her without requiring any such immodest display. "If your Majesty declines, I must refuse either to prescribe or to advise," replied Botkine, with great dignity. "It is impossible for anyone to diagnose a case without a thorough examination;" and before the astonished Empress could utter a word he began bowing himself out, and backed himself almost into the arms of Alexander II., who was just entering. Having heard from the ladies in the antechamber that a physician was with his wife, the Czar asked cheerily of Dr. Botkine how he found the Empress, and then perceiving the latter's disconcerted look, inquired what had happened. The young doctor replied that Her Majesty had refused him or any other physician to examine her chest in the customary manner, and that, under the circumstances, he could not conscientiously either diagnose the case or prescribe for it. Struck by the young man's independence of character and language, as well as by his honesty and common sense, the Czar dismissed him in the most kindly manner with instructions to call at the palace on the following day at noon. Dr. Botkine made his appearance at the appointed hour, was received by the Emperor and conducted by him to the Czarina, who had been in the meantime prevailed upon by her husband to submit to the examination. The remedies subsequently administered by the young physician afforded so much relief to the Imperial patient, that thenceforth Dr. Botkine's fame and fortune were made. The Empress would allow no one else to attend her. He acquired a most extraordinary influence over her, and remained with her until her death at Nice. Subsequently he set up in private practice at St. Petersburg, although retaining his Court appointment at St. Petersburg, and his high favour of the Imperial family during the remainder of his life.

## ENDURANCE.

HOW much the heart may bear, and yet not break!

How much the flesh may suffer and not die!

I question much if any pain or ache

Of soul or body brings our end more nigh.

Death chooses his own time; till that is worn,

All evils may be borne.

We shrink and shudder at the surgeon's knife.

Each nerve recoiling from the cruel steel,  
Whose edge seems searching for the quivering life;

Yet to our sense the bitter pangs reveal

That still, although the trembling flesh be torn,

This, also, can be borne.

We see a sorrow riding in our way,

And try to flee from the approaching ill;

We seek some small escape—we weep and pray.

But when the blow falls, then our hearts are still—

Not that the pain is of its sharpness shorn,

But think it can be borne.

We wind our life about another life,

We hold it closer, dearer than our own;

Anon it faints and falls in deadly strife,

Leaving us stunned, and stricken, and alone,

But ah! We do not die with those we mourn;

This, also, can be borne.

Behold, we live through all things, famine, thirst,

Bereavement, pain; all grief and misery,

All woe and sorrow; life inflicts its worst

On soul and body, but we cannot die,

Though we be sick and tired, and faint, and worn;

Lo! All things can be borne.

"THE LOVE OF HOME" is deeply rooted in the hearts of English women, and to make home cheerful and happy is their great desire. To attain this end, it is essential that pure and wholesome food and drink should be consumed. Above all, they should purchase the "BEST TEA." HORNIMAN'S TEA is "the Best" to buy.

## LONDON WATER.

THE recently-issued official report on the London water-supply should allay a good many apprehensions. It will, no doubt, prove also a damper for those of us who may have been dreaming of drawing unlimited supplies of the pure elements from Windermere Lake or from the Welsh hills. There is a fine and fascinating element of romance in the idea of finding water in a beautiful mountainous country, redolent of all things sweet and wholesome, and bringing it through immaculate channels, for many a mile, in a perfectly fresh and sparkling condition, straight into our homes. Why should Glasgow rejoice in its unparalleled supply from Loch Katrine, in the far Trossachs, while we are compelled to put up with such questionable sources as the Thames and the Lea? Why should not Londoners also enjoy the delight of drinking, almost at first hand, from mountain streams away yonder in South Wales or in the romantic district of the Lakes? These are, perhaps, natural enough, questions; and the matter-of-fact answer virtually given to them by the Commissioners is:—"You have no need to go so far afield when you have a practically unlimited and sufficiently pure supply at your own doors."

The first question that may occur to some on hearing this assurance is, "What guarantee have we that men who make it have any claim to speak with authority?" And we have but to look at the constitution of the Commission to satisfy ourselves on that point. With a strong chairman at its head, in the person of Lord Balfour of Burleigh, it numbered among its members men like Sir A. Geikie, Director-General of the Geological Survey; Sir George Bruce, the eminent civil engineer; Mr. G. H. Hill, who had a share in the introduction of the Loch Katrine water into Glasgow, and other experts whose judgment may be supposed to carry weight on the various theoretical and practical aspects of the inquiry. But these eminent men have not relied only on their own personal knowledge of what is needed in a satisfactory water-supply, and of the local conditions which affect the question as regards London: They have also called to their aid, and availed themselves of the acquaintance with the subject possessed by the municipal and other authorities within the area embraced in the inquiry, and they have consulted those who, from their special studies or experience, had a right to offer an opinion on the questions that occur in connection with the matter on which the Commissioners had to report. These gentlemen may, therefore, fairly claim to speak with authority.

What they have to say has a bearing, of course, on the two main questions that are of importance in relation to a water-supply—namely, quantity and quality. How much water ought to be furnished each day to each individual in a community? That is a question to which different authorities may give different answers. It is well-known to our readers that the Messrs. Pears issue as a pictorial advertisement what professes to be a testimonial from an extremely seedy-looking gentleman, who writes: "Two years ago I used your soap, and since then I have used no other!" And it must be admitted that the artist (Mr. Harry Furness, if we mistake not) has succeeded in representing the gentleman as if his testimonial were perfectly trustworthy. If we were all of the opinion of this worthy, the authorities need not trouble themselves about providing an extravagant supply of water; and he may be taken as representing a large class who have been unhandsonly but graphically described as the "Great Unwashed." But there are a good many of us who desire not only to quench our thirst, and to have our victuals cooked, but also to have, in Bible phrase, "our bodies washed with pure water." Clean linen, too, is generally considered a desirable adjunct of civilised habits; so that it is impossible to limit the quantity of water required to the dimensions that would satisfy the uncommonly modest desires of Messrs. Pears' picturesque friend and men like him.

Dr. Parkes has calculated the amount of water required daily per head in a household of fairly clean people at 12 gallons. This includes

the quantity needed for a daily sponge bath of 2½ gallons to 3 gallons; but it does not include a water-closet supply. When we take into account, however, the various uses for which water is in demand—for drinking—either alone or in combination with something else—for cooking, for washing of clothes and of the person, for horses and cattle, and for trades and manufactures, we find that a much larger quantity than this is required. In a lecture on this subject delivered towards the close of last year by Major Flower, of the Sanitary Institute, he stated that provision should be made for a daily supply of from 30 to 35 gallons as a minimum, especially as a considerable proportion of the quantity provided would not reach the consumer, owing to imperfect fittings and carelessness. In 1884 the average supply per head in the London districts was 28 gallons in the twenty-four hours; but in Glasgow, for more than forty years, the generous amount of 33 gallons a day has been secured for each inhabitant, and operations are now being carried on which, when completed, will make available a quantity of water more than double of what is at present capable of being supplied. And London ought not in this respect to be behind any city in the kingdom.

From the report which has just been issued by the London Water Commissioners we learn that the present supply to the metropolis, which is at the rate of 37·10 gallons daily per head of the population, could be very largely increased from the existing sources, without injuriously affecting any material interest. The present consumption amounts to over 200 million gallons a day; but this quantity can without difficulty be gradually increased until it reaches 450 millions or thereby, which would supply over 12 million persons at the rate of 35 gallons a day to each. That number of persons, we are told, is nearly a million in excess of what the total population of Greater London will have become in 1931, even if the ratio of increase of last decennial period to 1891, is fully maintained; and perhaps it is enough in the meantime to look some forty years ahead.

So much for the quantity. It is plain that, without touching on any new sources, the existing supply is amply sufficient to satisfy the most exacting, even having regard to prospective needs. But a still more important consideration is that of quality. Under this head also it is gratifying to observe that the report of the Commissioners is in the highest degree reassuring. They testify that the water is of a high standard of excellence and purity, and perfectly suitable for all household purposes; and they see no necessity, therefore, of going to Wales to find a fresh source of supply. And this conclusion is not arrived at in ignorance of the prejudice that exists against the use of drinking-water derived from the Thames and the Lea. These rivers, it is well-known, are liable to pollution—sometimes in a very extreme form, and the prejudice against using the water derived from them is not overcome by the knowledge that it has been subsequently purified either by natural or by artificial means. The Commissioners do not believe, however, with an experience of London for the last thirty years, and having regard to the evidence which they have collected on the subject, that any dangers exist of the spread of disease by the use of this water, provided that there is adequate storage, and that the water is efficiently filtered before delivery to the consumers. These are, no doubt, exceedingly important conditions; but, with the means at the disposal of the authorities, there is no reason why they should not be adequately fulfilled. From what has been said above, it will be seen that there is abundant opportunity for making, as is being done in Glasgow, ample provision for a storage supply; and, in the light of what has been taking place in Hamburg, there should be no difficulty in taking the necessary steps for effective filtration. On the whole, it is evident that the London water question is in a more satisfactory condition than it was popularly believed to be.—*Sanitary Record*.

SATISFACTION GUARANTEED. Health, comfort, economy. CORSETS made to order wear best. Distance no hindrance. Measurement—free. Every kind, lowest prices, best quality, made quickly by FORD & PARR, Corset Factory, 141, St. Mark's-road, London, S.W. Estd. 1856. Try one. Please call or write.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**BOILED EGGS.**—It is the common way to boil eggs only about five minutes, and call them hard. They are then very "hard" of digestion. Boil ten minutes and they are still hard and soggy. Boil them twenty minutes and they become light and mealy, and may be easily mashed and seasoned. To boil eggs so that they shall be "soft," drop the whole eggs carefully into boiling water, and boil steadily three and a half minutes by the watch. This is a common method; though the white is hardened, the yolk is scarcely cooked at all. Another method is to lay the eggs in a warm basin or saucepan, and cover with boiling water. Let them remain without boiling, but where the water will keep hot for ten minutes. Both yolk and white will be cooked soft.

**APPLES IN JELLY.**—Peel, quarter, and core some good apples. Cook with just water enough to cover them, some slices of lemon and clarified sugar, till tender. Take out the pieces of apple and arrange in a dish. Boil the syrup till it will jelly, and pour over the apple.

**A LESSON IN ROASTING.**—And now for the lesson in roasting. Suppose we take a calf's heart, and make a dish which for economy and delicacy is not half well enough known, although it will be after a few hundred more girls have learned how to prepare it. You must wash the heart thoroughly in cold water, to remove the blood, and cut out the veins and arteries. This may not be a pleasant task to everyone, still it is no more unpleasant than preparing fowls or game. Make a stuffing with one tablespoonful of bread crumbs, one tablespoonful of chopped onions, one tablespoonful of powdered sage, one half a saltspoonful of salt, and a tiny bit of pepper. This you may moisten with milk or water. After it is prepared put it into the cavity caused by the removal of the arteries, and sew the edges together. Slice an onion and brown it in a tablespoonful of clarified dripping; skim out the pieces of onion, reserving them for use, brown the heart in the seasoned fat, then put it with the onion in a deep dish, and half cover with boiling water. Bake in a hot oven one hour, basting every ten minutes, add more water if necessary. When the heart is done you may make a gravy by thickening the water that is left in the dish with a little flour wet in cold water, just as you do in mutton gravy. You will find this a very nice occasional dish for dinner, and a very inexpensive one.

**MACKEREL.**—A delicious and little-known way of cooking mackerel is as follows:—Choose large, fresh soft-roed mackerel. Make an incision an inch deep down the back, and lay in dish filled with half a pint of sweet oil, a pinch of salt and pepper, and an onion cut in rings. They should be allowed to stop in this mixture a couple of hours and turned over from time to time. Half an hour before serving, rub a clean gridiron with oil, wipe the fish, sprinkle with little salt, laying them an inch apart on gridiron over a slow fire. When browned on both sides take them off and lay them in the dish whence they are to be served. When there open the backs with a spoon, and introduce a small piece of fresh butter mixed with salt, pepper, and minced parsley.

**KEDGEREE.**—A favourite dish with Indian civilians, or those who have lived in hot countries, is Kedgerree; but great care should be taken in preparing it, for though the recipe is simple, a mistake is fatal. Boil a cupful of rice twenty minutes, and four eggs till they are quite hard, then take any kind of cooked white fish and pull it in pieces, taking care that there are no bones left. Chop the eggs very fine, add three or four ounces of fresh butter, season with salt and cayenne pepper, beat the whole together and serve as hot as possible.

**EAT IN COMFORT.**—Indigestion prevented by the use of DUNN'S FRUIT SALT BAKING POWDER. Makes delicious Bread, Cakes, Pastry, &c., which require but little digestive effort, and is, in fact, Ask your grocer. Large sample tin and stamps.—W. G. DUNN & CO., WORKS, CROYDON.

**POTATO A LA BARAGOUTE.**—Cut cold boiled potato the shape and size of olives, and fry, with a spoonful of mixed herbs adled, in olive oil, and you will have potato à la baragoutte.

**SALMON, YORKSHIRE FASHION.**—The following is a Yorkshire way of cooking dried salmon, or the remains of grilled salmon, and will be new to many people:—Pull some dried salmon into flakes; add to them the same quantity of hard boiled eggs chopped large. Put the mixture in a pint of cream with two ounces of butter rubbed up with a teaspoonful of flour; skim and stir till the whole boils; make a wall of mashed potatoes round dish, and put fish in the centre.

**PINEAPPLE SHERBERT.**—One pint of freshly-grated pineapple slightly sweetened, one pint of hot water, one pint of sugar, the juice of two lemons, one tablespoonful of gelatine. Soak the gelatine in just enough cold water to cover till soft, and dissolve with hot water. Stir in sugar and lemon-juice, and, when cold, freeze. When half-frozen, add the grated pineapple and continue the freezing. One must be careful to beat the mixture at once, or the gelatine will form in lumps, and sink to the bottom of the can, thus impairing the smoothness and lightness of the sherbet.

**LITTLE PIGS IN BLANKETS.**—Take as many large oysters as are wished, wash and dry them thoroughly with a clean towel. Have some fat bacon cut in very thin slices, cover each oyster with them, and pin on with wooden toothpicks. Broil or roast them until the bacon is crisp and brown. Do not remove toothpicks. Serve hot.

## HINTS FOR THE HOUSEHOLD.

**HOW TO CLEAN LACE.**—To clean lace, fill a bottle with cold water, draw a stocking tightly over it, securing both ends firmly. Place the lace smoothly over the stocking and tuck closely. Put the bottle in a kettle of cold water containing a few shavings of soap, and place over the fire to boil. Rinse in several waters and then drain and dry. When dry, remove and place smoothly in a large book and press with weights. Very nice lace can be made to look like new by this process.

WEAK spots in a black silk waist may be strengthened by "sticking" court plaster underneath.

A HALFPENNYWORTH of whiting and a bottle of ammonia will keep silver forks, spoons, and other tableware always bright and shining.

GUM ARABIC and gum tragacanth, in equal parts dissolved in hot water, make the best and most convenient mucilage you can keep in the house.

**HOW THE ARABS MAKE TEA.**—The mistress of the tent, placing a large kettle on the fire, wiped it carefully with a horse's tail, filled it with water, and then threw in some coarse tea and a little salt. When this was near the point of boiling, she tossed the tea about with a brass ladle until the liquor became very brown, and then it was poured off into another vessel. Cleansing the kettle as before, the woman set it on the fire in order to fry a paste of meal and fresh butter. Upon this the tea and some thick cream was then poured and the ladle put in requisition again, and after a time the whole taken off the fire and set aside to cool. Half-pint wooden mugs were handed around and the tea ladled into them, this tea forming meat and drink and satisfying both hunger and thirst. However made, tea is a blessed invention for the weary traveller.

EGG stains can be removed by rubbing them with common table salt.

To keep flies off gilt frames, boil three or four onions in a pint of water, then apply with a soft brush to the frames.

WHEN whalebones have become bent, they may be used again by first soaking them in tepid water for a few hours, and then drying them.

LAMP-WICKS must be changed often to insure good light, as they will soon become clogged, and the oil does not pass through them freely.

A clear flame will be certain if the wicks are soaked in vinegar twenty-four hours before using.

WHEN washing windows, looking-glasses, &c., be sure to put a little ammonia in the water. This will save labour, and clean them much more effectively, giving as well a much finer polish. For general cleaning, ammonia in the water will remove dirt, smoke, grease, &c., much better than anything else.

Do not wash combs unless absolutely necessary. Water will make the teeth split and the comb rough. Small brushes, which are made for the purpose of cleaning combs, are easily obtained at little expense, and with one of these the comb may be thoroughly cleansed, wiping well and following with a soft cloth afterwards.

**THE ORIGIN OF VISITING-CARDS.**—As is the case in many other instances, we owe the invention of visiting-cards to the Chinese. So long ago as the period of the Tong dynasty (618-907) visiting-cards were known to be in use in China, and that is also the date of the introduction of the "red silken cords" which figure so conspicuously on the engagement cards of that country. From ancient times to the present day the Chinese have observed the strictest ceremony with regard to the paying of visits. The cards which they use for this purpose are large and of a bright red colour. When a Chinaman desires to marry, his parents intimate that fact to a professional "match-maker," who thereupon runs through a list of her visiting acquaintances and selects one whom she considers a fitting bride for the young man; and then she calls upon the young woman's parents, armed with the bridegroom's card, on which are inscribed his ancestral name and the eight symbols which denote the day of his birth. If the answer is an acceptance of his suit the bride's card is sent in return; and should the oracles prophesy good concerning the union the particulars of the engagement are written on two large cards, tied together with the red cords.

## SOME REASONS FOR DAILY EXERCISE.

ANY man who does not take time for exercise will probably have to make time to be ill.

Body and mind are both gifts, and for the proper use of them our Maker will hold us responsible.

Exercise gradually increases the physical powers, and gives more strength to resist sickness.

Exercise will do for your body what intellectual training will do for your mind—educate and strengthen it.

Plato called a man lame because he exercised the mind while the body was allowed to suffer.

A sound body lies at the foundation of all that goes to make life a success. Exercise will help to give it.

Exercise will help a young man to lead a chaste life.

Varied, light, and brisk exercises, next to sleep, will rest the tired brain better than anything else.

Metal will rust if not used, and the body will become diseased if not exercised.

A man "too busy" to take care of his health is like a workman too busy to sharpen his tools.

If I am to pass through death unscathed, if I go over there the kind of man I have made myself by my words, my actions, my thoughts while here, then it does not make any great difference, even if some one of you does have twice as many thousands of dollars along the road as I have. These incidents of the way become of very slight importance the moment we make life mean the development and culture of character; and the man with poor opportunity and very little money, who makes of himself a grand and noble man, when the curtain opens and he passes through, is unspeakably richer than the richest man here who misuses his opportunity.—*Minot Savage.*

# THE MOTHER'S PAGE.

## MANNERS AT THE TABLE.

AMONG people of average means, with aspirations toward fashion, it is the custom to permit the children to share with their elders each family meal. Many who can afford a nursery where the children might be "kept in a barrel, and fed through the bung-hole," as some would-be wit has suggested, till old enough to have good manners expected of them, prefer the company of the little ones at the table. Such being the case, children should early learn that there are some table rules which they are bound to respect. That, if they share the companionship of their elders, they must contribute their necessary individual shares toward a pleasant and harmonious gathering.

This may seem like a trite observation; but who does not meet with frequent instances, suggesting the desirableness of special instruction in table etiquette, so utterly have the parents seemed to neglect their duty? And who but has a more or less defined idea that it is impossible for one's own children to be really vulgar or rude, no matter what they do? But, though their little ways are naturally "cute" and pretty in our eyes, is it not well to occasionally put ourselves in the place of an outside observer, and dispassionately criticise our children's table-manners, lest they be insensibly contracting habits which shall render them disagreeable to others?

An instance recently observed was that of a child of four years—and a little girl, at that—whose shockingly bad manner of appropriating her food might have disgusted a well-taught domestic animal, and prompted it to decline her company at meals. Her parents seemed scarcely to notice her conduct, though occasionally admonishing her; but surely familiarity could only breed contempt—not for the untaught child, but for the mother who could permit her to reach the age of four, in such a "state of nature."

A spoon or her fingers—whichever seemed handiest—performed, impartially, upon the contents of her plate, and conveyed them, indiscriminately, to her mouth, up her sleeve, to any exposed portions of her countenance, or adjacent parts of the surrounding country. And the contents of that plate! Beginning with a goodly supply of meat and vegetables, the load was slowly augmented, instead of diminished, during the repast, by every desired article on the proverbially liberal country dinner-table, till a mosaic mound of meat, vegetables, pastry, fruit, condiments, &c., large enough to satisfy the hunger of several children of her years, remained to tell of the ruin she had wrought. Everything she asked for was unhesitatingly and lavishly given her; and, when she could eat and scatter no more, she amused herself by blending into a pleasing compound the accumulation before her.

This was, indeed, an exaggerated case of lack of instruction; but a great many children are not properly trained in table-manners; and it must always be the fault of the mother—if there be one—that this is so. Let no one plead that she has not the time for such instruction; a mother must pay the price of maternity, and has no moral right to shirk her obligations, nor to let other matters crowd them aside. There is a right and a wrong way to do everything. The wrong way to go about this is to wait till the child has become fixed in awkward and slovenly habits, and then try to correct them by sharp reprimands or punishment. One cannot begin too soon after the child begins to eat to teach it to take its food daintily; to avoid spilling liquids, scattering solids, smearing the hands and face and pinafore; to hold the spoon and fork correctly, using the latter whenever possible; to eat slowly, avoiding all unnecessary noises, movements, or exhibitions of the act of mastication. Like unto these rules, and quite as important, are those points of deportment

which do not really include the partaking of food. To wait quietly, until helped; not to clamour for desired articles, or tease for them when refused; not to overstock the plate, or desire more than can be eaten; to talk little, unless spoken to, especially at a strange table; never to leave the table before the others, unless asking and obtaining permission from the lady at its head.

These well-known essentials are necessary among civilised beings, if one is to enjoy both the companionship and the food at meals; and it detracts from that enjoyment to have the meal serve as an object-lesson for the instruction of the child. A mother who has the right influence over the little one can so instruct and prepare him beforehand, or when there are no observers, that an occasional encouraging or reproving smile or frown from her will be all that is necessary at the table. Any mistakes, not wilful or flagrant, may be discussed between them afterward. It is apt to embarrass, if not "harden," a child to have the attention of the company directed toward it by a reproof. But mistakes or misconduct should be noticed, and pointed out in private. A few months of eternal vigilance is a small price to pay for correct habits of eating, and will save both mother and child a great deal of regret in after life—not to speak of sparing the feelings of chance guests or companions who consider decency in partaking as essential a seasoner of a meal as the condiments in the food.

## HOW TO TREAT A CHILD GUILTY OF A SLIGHT TRANSGRESSION.

WHEN a child does wrong we should try to probe to the spring of the action and apply the remedy there. If he disobeys we should ask ourselves whether the obedience we demanded was reasonable, and whether to render it did not require him to overcome a temptation beyond his power to resist. To dress a child in spotless attire, and send him out to play with the injunction not to soil his clothes, is as futile as to tell him to swim without going near the water. Contact with mother earth, which his imperative instincts compel him to seek, makes obedience impossible. Dress him sensibly, and let him get face and hands dirty; they will wash. If it seems necessary that he should be made more careful, instead of taking off the soiled clothing, scolding him, shaking him and re-dressing him, let him wear the offending garments for a time until he is ashamed of their condition, and make him understand that if he is careless he must abide by the consequences. If a child takes sweet things surreptitiously it may be because he does not have a sufficient quantity of saccharine matter with his daily food. Give him more sugar or jam at his meals. Many persons can recall the uncontrollable longing for sweetmeats which haunted their childhood. At the same time, make the offender understand that he has for a time forfeited your perfect confidence; that you would have given him what he wanted had he asked for it; so he has been foolish as well as greedy, and that no manly man seizes what he wants without stopping to ask whether he is getting it rightly or wrongfully. He will appreciate the force of your argument, and the next time the sweets tempt him he will be far more likely to resist than if he had been whipped for taking them. That inward monitor which we call conscience is with the boy when we cannot watch him. If we can arouse that and keep it on the alert, we have provided a better safeguard than the fear of punishment.

## "NAMING THE BABY."

THERE is one particular fault most parents have, and this is in giving children nicknames. It usually begins at home. They think it funny to nickname the baby, but they must remember that the kitten will be a cat some day, and the nickname will cling to it through life.

Again, some parents manufacture names. This might be done all right occasionally, but census takers and school teachers run across many

amusing illustrations of follies into which it sometimes runs. For instance, Dickens in one of his novels tells of a woman who made up a name for her child, calling it Morlena. Nothing could be more ridiculous than this name, yet the mother must have thought the name very beautiful. A girl was once named Charlena because her father's name is Charles. It is well to avoid such names as Truth, Faith, Patience, Virtue, Sunshine, &c., as the bearer of these names may grow up to maturity exhibiting qualities entirely the contrary of these names.

## ATTITUDES OF WOMEN IN SITTING AND WALKING.

THERE is no attitude at which a woman is more graceful than a devotional one. Indeed, one old cynic has said women ought to do all the praying in the world, since the kneeling position is so beautifully adapted to the lines of their slender figures. But see the awkward woman at her prayers. Slowly the muscles relax, and she sinks lower and lower down in a little huddled heap, bobbing her head about for a comfortable place on the edge of the pew in front of her, all so lazily that one wonders if her prayers are earnest enough to be answered.

To sit well may be quite as great an art as to write a poem, and to accomplish either require effort. The pretty pose of the head, the erectness of the trunk, and the graceful disposition of the lower limbs are clearly emphasised in a type of women with which *habitués* of the opera are familiar. Now this particular graceful, alert, bird-like pose, which even in repose suggests something of action and energy, is only attainable by strengthening the muscles about the waist and hips. There are various exercises for the muscular development which, of course, the average woman, who, even with no house to keep or children to rear, is always more hurried and busy than the Prime Minister of a nation, never has a moment to practice but the best and most effectual of them all she can attend to with a little thought on her way to the *matinée*, in the midst of a *musical*, and that is to hold her body perfectly erect for half an hour each day, touching neither chair, carriage, or seat back, and sitting well toward the edge of the seat, with the right foot slightly in advance of the left, ready to rise quickly without help from the hands at an emergency. After a time prolong the half hour to a whole hour, two, three hours, and finally, so elastic, sinewy, and independent will those lazy muscles become that she will cease to care for spinal supports and head rests like a pseudo-invalid.

Dignity and grace of carriage depend upon simple things, yet a graceful walk is one of the rare charms among women. Someone has given a pretty formula for walking correctly, as follows:—Fancy a slender cord about your chest, just beneath the arms, the ends of which an angel bears aloft, fluttering just above your head, and walk so gently and smoothly and erectly that the frail cord shall remain taut, yet not be permitted to break. Remember, too, to hold yourself firmly at the waist; step lightly on the ball rather than the heel of the foot; do not bend the knees except very, very slightly in taking a step, and keep the toes in a straight line, rather than turned outward.

By thine own soul's law, learn to live;  
And if men thwart thee, take no heed,  
And if men hate thee, have no care—  
Sing thou thy song, and do thy deed;  
Hope thou thy hope, and pray thy prayer,  
And claim no crown they will not give.

—John G. Whittier.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

STEEDMAN'S Soothing Powders for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, &c., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Waltham, Surrey. Sold everywhere. Please observe the SE in Steedman.

"The FAMILY DOCTOR. Truly an Astonishing Pennyworth."—Knowledge.

[SPECIAL ARTICLE.]

DIET FOR ALL.

By a PHYSICIAN.

THERE can be little doubt that in this nineteenth century there is a great tendency, even amongst celebrated physicians, to take to heart the Shakespearian maxim, to "throw physic to the dogs."

If you have occasion to consult a West-end physician of eminence, and you carefully note his advice, and his method of giving it, you will observe that he is first of all extremely careful to correct your *habits of life*, and then *regulate your dietary*, and adds, after scribbling a prescription, as a kind of after-thought, "Take this," before the parting injunction is given to see him again in a week's time, with the intimation that his fee is five guineas.

Undoubtedly the majority of us are born into the world with fairly healthy bodies, to be made or marred by our habits, domicile, occupations, and last, but by no means least, *the food we eat*.

There can equally be no doubt that from infancy upwards we are the victims to a large extent of the artificial foods of civilisation; many of which, whilst not inherently bad in themselves, are wrongfully administered in childhood, and taken by the individuals of maturer age to stimulate a jaded palate.

What is "one man's food is another man's poison" is a trite axiom, the proof of which is to be met with every day at our own fireside.

Whilst there is no doubt that such a table as the one published a week or two ago in the FAMILY DOCTOR on the "Digestibility of Foods" is of great service to anyone in good health, a large portion of mankind do not enjoy such a keen relish for food that anything put before them, simply on the score that experimental results had proven that it could be digested in a certain length of time, would be acceptable, and what is of far more consequence, would be serviceable to that particular human being. One cannot help sympathising with a correspondent in this week's number who asks, "What may he eat and drink?" Tea, coffee, water, milk, and beer have all been equally condemned by various writers; but let it at once be stated, mostly by those who have a "bee in their bonnet" on the particular theme on which they write; there is no doubt that each and all of the foods and liquids condemned, under certain circumstances, are apt to be hurtful to the human economy. Alcohol—*pace*, my teetotal friends—is a food—that is, if you grant me as a definition that any substance which contributes to the heat, or building of the tissues is a food. Up to a certain quantity—viz., two ounces per diem—it is burnt up in the tissues, and does not pass out unchanged, yet there is evidence all around us of the evil that excessive alcoholic inhibition leads to, but there can equally be no doubt that when a man engaged in laborious, anxious employment in the City returns home to his suburban residence, where his loving wife has prepared for him a dainty dinner, which he cannot eat because he is weary and tired, and perhaps cold, and his stomach, in sympathy with the rest of his body, refuses food; if such a person were to partake of a glass of generous wine, the artificial stimulus thus brought to bear would act as a fillip, and cause that necessary glow through the system, besides waking the stomach to a sense of its duties, and the food would be relished and digested. For proof I again refer you to your daily surroundings, where you will find this fact demonstrated beyond doubt, and furthermore I would point out that it has reason on its side.

Here then we have a substance, which common experience proves to be at once harmful and good, and, least I have alarmed anyone of pronounced anti-alcoholic sentiments, let me point out that I have said nothing about the taking of the substance for the simple pleasure of drinking.

Tea, properly made, is equally a gentle stimulant that is grateful and helpful at times, but the idiotic practice of persons, mostly women, who drink it on every available occasion, sometimes with all the tannin dissolved out from

long standing, cannot be too much condemned. Common salt is a necessary article of diet to preserve the body in health, yet we all know the effects of a tablespoonful dissolved in water swallowed at one gulp.

By this time I trust I have demonstrated that an article may at the same time be a good food and a poison.

Many persons say, "I cannot take milk or eggs," and almost every article of dietary is assailed by someone on the plea that "it does not agree with me," and although these good people are no doubt right up to a certain point, yet let such a one be deprived of other foods, and it is quickly evident that the major portion of the supposed inability to take this or that food existed to a large extent in the imagination. This is a common experience in our large hospitals, but although the stomach will, under altered circumstances, take a food it would otherwise have rejected, there is no doubt that this very common explanation goes far to prove the proverb which I put forward as an axiom a few sentences back.

The great question is with the bulk of mankind, "What must I eat?" and say they, "I want to know what to take and what to avoid, definitely and precisely, as I am not in good health—I am suffering from so-and-so."

It will be my endeavour to answer this question, a question to which many answers have been given; unfortunately mostly from faddists, or else contained within the limits of large tomes, which get dusty on the top shelves of libraries, and are only taken down by the specialist or the seeker after knowledge for its own sake.

		The Solid Components consist of				
		Sugar	Butter	Casien and Extractives	Salts	
100 parts contain	Solids	110.92	135.94	109.88	153.10	167.68
	Fluids	889.08	864.06	890.12	844.90	832.32
Sp. Gravity		1032.67	1033.38	1034.57	1033.53	1040.98
		Human ...	Cow .....	Ass .....	Goat .....	Ewe .....
		43.64	26.66	39.24	1.38	
		38.12	36.12	55.15	6.64	
		50.46	18.53	35.65	5.24	
		36.91	55.14	55.14	6.78	
		39.43	54.31	69.78	7.16	

I will endeavour to be precise, and avoid technical terms, stating at once that given an adult individual in good health, the question within proper limits of moderation will resolve itself largely into a question of *taste and the digestibility* of the various articles of food, for information on which subject I would refer the inquirer to the table published in the FAMILY

DOCTOR in the copy for the week ending September 30th.

With the infant the case is obviously different.

The infant should be suckled, if possible, for the first nine months of life; if not by the mother, then by a judiciously-chosen wet-nurse.

If a wet-nurse cannot be procured for any reason, then artificial milk must be made as nearly resembling human milk as possible. For this purpose the milk of the cow, ass, and goat are all recommended as a basis, but the table prepared by MM. Vernois and Bequerel shows at once that the value of asses' or goats milk over that of cows is more imaginary than real.

Goat's milk is objectionable on account of its unpleasant odour, but this is counterbalanced by the ease with which a goat is kept in cities compared with a cow.

Milk from a large number of cows is far more likely to be of a good average quality than milk from one cow, because during the process of lactation by a cow the milk from first to last varies greatly in quality.

Give milk and water (with a very little powdered sugar) in equal proportions to the new-born child, and it should beat the temperature of the human body. From the second to the fifth month the dilution should be one-third to one-fourth its quantity, and from the sixth to the end without dilution. Gradually, after nine months, feed on nursery biscuits and milk, or on one of the artificial foods in which the starch has been turned to sugar by a chemical process. Do not give green vegetables until the child is two years' old; after eighteen months give light farinaceous puddings. But the baby and child have been liberally catered for in times past in the "Mother's Page" in this journal, and we will now pass on to the diet of the adult. It will perhaps add to the interest if I take the ailments of ordinary mankind and submit a list of appropriate articles of dietary for each, and this plan I will now pursue, adding at the end three reminder tables for invalids.

BRIGHT'S DISEASE (Kidney Ailment).—Milk, cream, farinaceous foods made up with milk, vegetable soups, fresh green vegetables, cooked fruits, white fish, chicken, game, claret and burgundy, with Apollinaris or seltzer water.

Which, in short, means avoid strong meats, eggs, cheese, pastry, and spirits.

ANÆMIA (Poor Blood).—Meat (beef and mutton), poultry, fish, green vegetables, eggs, cream, fruit, cocoa, burgundy, and bitter ale.

PHTHISIS (Consumption).—Well-cooked meat, curds and whey, cream, butter, milk, farinaceous foods, in addition to those named under "Anæmia."

That is, take fatty foods and avoid pickles, salads, lobsters, crabs, nuts, cheese, and anything that takes a long time to digest.

SCROFULA and RICKETS.—Diet the same as "Phtthisis."

GOUT and RHEUMATIC AILMENTS.—Chicken and oysters, fresh green vegetables freely; potatoes, salads, tomatoes, and farinaceous foods sparingly, ripe stewed fruits *ad lib.*, tea and coffee without sugar, natural mineral waters—such as Apollinaris or Vichy water—and a little old sound Scotch whisky.

That is, avoid meats, fats, and saccharine articles of dietary, and perhaps it is as well to omit grapes and currants from the fruits on the score of the amount of sugar these two contain.

DIABETES.—Meats of all kinds, except liver. Fish of every kind, soups made without vermicelli or farinaceous thickening, eggs, cream, butter, cheese, green vegetables, nuts, distilled aerated water, soda water, tea and coffee sweetened with saccharine, with which all the foods may be sweetened if necessary.

Avoid all farinaceous and sugary foods, bread (except gluten bread), biscuits, turnips, carrots, parsnips, potatoes, beans, peas, sweet fruits, dried fruits, sweet wines, including champagne and milk.

CONSTIPATION.—Fruit, and this is seldom taken long enough to effect a cure; coarse brown bread, salads, are the most desirable items of food in addition to ordinary dieting. Avoid cold milk puddings.

DIARRHŒA.—Liquid food, cold. Cold farina-

"The FAMILY DOCTOR may be recommended as safe and useful in all Households."—The People.

aceous puddings, cold milk, Indian corn, arrow-root, tapioca, sago, cream, puddings with eggs.

But the food must be cold, and avoid hot beef-tea, &c.

**SICK HEADACHE.**—Good food, such as that under "Anæmia," but when the attacks are eminent avoid all food.

**DYSPEPSIA.**—Three meals a day—one a meat meal. White fish, mutton, poultry, game (not rabbit or hare), eggs in some cases, green vegetables, well-cooked and strained. No potatoes, all solid root vegetables—such as turnips—are best avoided as not easy to digest. Spinach and asparagus, rice, macaroni, toast, and biscuits. Light farinaceous puddings. Cocoa, milk and water. Claret, champagne, hock, and sherry in moderation. Weak whisky and water.

Avoid pork, veal, and salted meats. Potatoes, turnips, parsnips, peas, beans, cauliflower, new bread; malt liquors, with perhaps the exception of a well-hopped bitter ale. Lobsters, crabs, nuts, pickles, cheese, tea, and coffee.

**ECZEMA.**—In acute stage, light farinaceous food only. Cooling beverages freely. Avoid stimulants and meat. In **CHRONIC ECZEMA.**—Avoid salt meats, including ham, bloaters, haddocks, salted salmon, caviare, cheese, spices—such as pepper, salt, mustard, chutney, and curries.

**SCURVY.**—Fresh vegetables, fresh meat, milk fruits, especially lemon, oranges, and tomatoes. Lime-juice.

**HEART AFFECTIONS.**—As for "Phthisis."

**FEVERS (General).**—A selection from Diet Tables II. and III. In Typhoid the dietary must be regulated by the physician in attendance.

**CHOLERA.**—As for "Diarrhœa," but no food is permissible in severe cases.

TABLE I.

## MEATS, SOUPS, &amp;c.

Beef essence	Beef jelly
Beef juice	Calves'-foot jelly
Beef tea	

## BROTHS.

Chicken	Mock-turtle soup
Mutton	Oyster soup
Rabbit	Turtle soup
Gravy soup	Vegetable soups
Ox-tail soup	Raw meat pulp
Hare soup	Powdered meat

TABLE II.

## MILK AND FARINACEOUS FOODS.

Arrowroot and milk	Milk and suet
Caudle	Oatmeal gruel
Cornflower and milk	Peptonised milk
Curds and whey	Rice milk
Custards	Sago milk
Clotted cream	Semolina pudding
Ice cream	Tapioca pudding
Junket	Rice pudding
Koumiss	Rizine pudding
Macaroni	

TABLE III.

## DRINKS.

Whey	Seltzer water
Barley water	Rice water
Lemonade	Soda water
Lemon whey	Treacle posset
Lime water	Vichy water
Lime water and milk	Strated distilled water
Lithia water	
Potash water	

I have now finished my task. Many ailments have been omitted, but it may be stated generally that no particular dietary will be necessary in these, although physicians of doubtful reputation will at times give vent to restrictions which to say the least are fanciful, and not based on any reasonable hypothesis, and seldom can be justified on reason or experience.

Lastly, let me urge all my readers that, however well you choose your dietary, there is still something lacking, you must eat your food slowly, masticate it well, if possible in company, and never drink a large quantity of any liquid with your meals.

"But how can I adhere to your lists, I am compelled to take my meals at a restaurant," I hear someone exclaim. The answer is: Get as near the list as you can. No other answer is possible if you cannot alter your habits.

Added are two tables showing the average amount of food required for a child aged seven years and an adult to keep each in good health:

## AVERAGE PER DAY FOR A CHILD.

Roast beef	...	12·46 oz.
Bread	...	10·23 oz.
Potatoes	...	10·3 oz.
Butter	...	·99 oz.
Milk	...	38·5 fl. oz.

## AVERAGE PER DAY FOR AN ADULT.

Meat	...	16 oz.
Bread	...	19 oz.
Butter	...	3½ oz.
Water	...	52 oz.

It will be seen that a growing child needs more in proportion to an adult—age and weight being taken into consideration.

## TALES WORTH TELLING.

[COMPLETE STORY.]

## UNDER COMPLETE CONTROL.

BY ALFRED ENGLISH.

**MAJOR HAWK** was one of your large and heavy men. He was a born hero and a warrior. His spirit was martial and commanding. He stood six feet two inches in his stockings.

The Major was not quarrelsome, but he was opinionated and unyielding. He was too big a man to quarrel, and too conscious of his own powers to yield a point in anything.

Major Hawk had lived a bachelor to the age of forty. At length, however, the erotic dart had touched his heart, and he offered to take a wife and make her mistress of the wife's appropriate department of his house.

Sylvia Aspen was a small, delicate woman, pretty and accomplished.

For several years she had taught the primary department of a young ladies' seminary, and the reverend gentlemen of the managing committee were forced to acknowledge that by no other teacher had the scholars ever been so thoroughly governed.

She had seen thirty years of life, and for reasons best known to herself she had refused all offers of marriage.

And now Major Hawk offered her his hand and his heart.

"Miss Aspen," he said, in his blunt, dictatorial way, "you have known me long enough and well enough to know something of the home I can provide. If you take me you will take a rough blunt man who must be his own master through life. I have my own peculiar views of the true marriage relation. The man is the head of the household. I can love and provide and protect; but I must be master. As I am I offer myself. You will not be deceived."

Sylvia smiled one of her sweet smiles, and, with her small white hand resting confidently upon the Major's arm, she told him she had accepted the situation.

"You are sure?" he queried.

"I am sure of this," she said, looking up into his face with candid fervour, "I love you well enough to marry you, and as for domestic government, the result must be as the result is the world over—the weak must depend upon the strong."

Major Hawk kissed the little woman, and assured her that he would never be tyrannical or unjust, and the day for the wedding was fixed.

People wondered when it was announced that Sylvia Aspen was to become the wife of Major Hawk.

"She will be a slave and a drudge!" was the general opinion.

"You don't know what you are doing," said an old and privileged friend, who had known the Major long and well. "Hawk will wear and fret the life out of you. He has the officers of his regiment at his house as often as once a week, and when they come they make a night of it. It's dreadful the way they carry on; and the whiskey and wine that is drank, and the tobacco that is smoked is beyond account. You don't think he will give up these things, do you?"

In due time—early in autumn—Thomas

James Hawk and Sylvia Aspen became man and wife.

The Major had planned to have the wedding a grand affair—to have his military friends present in full panoply, but Sylvia persuaded him not to. She said but little, but just enough to make him understand that it would please her to have it different, and he concluded to please her.

They had been married two weeks when the Major proposed that he would invite the officers of his regiment to dinner, about fifty of them.

"I suppose such a dinner means wine and plenty of it!" said Sylvia.

"Certainly," responded her husband. "When I invite my friends to my house I expect to treat them according to the fashion of the times."

"Then, Tom, I would rather you did not invite them."

The Major laughed at the absurdity of his wife's whim. Sylvia was mild but firm.

"Of course," she said, with a smile, "you will do in this matter as you please."

"Of course, I will," declared the husband, emphatically. "You know what I told you in the beginning—I must be master in my own house."

"But," interposed Sylvia, with the sweetest smile imaginable, "suppose I could show you that the greatest possible amount of comfort and joy you can find will come from pleasing me?"

"Eh?"

She kissed him, and then ran away.

Already Major Hawk felt a nipping at his ear; as though something was biting it.

Days and weeks passed and the officers of the grand old regiment were not invited to the proposed reunion at the Major's.

It was whispered that his wife would not allow it, and yet when the officers individually had occasion to call at the Major's residence, Sylvia treated them so kindly and so considerately, and bestowed upon them so much careful attention as friends of her husband, that they went away loud in her praise.

It was on a pleasant evening of the following spring that a select circle of friends met at the Major's house. Late in the evening a knot of gentlemen were seated in the great oriel of the drawing-room, while at the centre table near by were a few of the ladies at work.

In the oriel the conversation turned upon the Home Rule controversy. Doctor Rich advanced an idea in opposition to the cherished Tory opinions of his host. The Major fired up in a moment.

"I tell you, sir!" he exclaimed, smiting his huge fist upon his knee, "the political sentiments of Gladstone—"

Hark!

It was the tapping of a knitting-needle upon the arm of Sylvia's chair. The Major looked up, and met the glance of his wife. He coughed and stammered, and then smiled as he said:

"We won't enter into a political discussion in the presence of ladies. At another time, Doctor, I will give you my opinion upon the matter."

On their way home Dr. Rich and Captain Lewis walked together.

"Well, Doctor, what do you think now about poor little Sylvia's daring to say her soul's her own in the presence of her husband?"

"I am amazed," confessed the worthy doctor. "Why, bless me, she rules him with a rod of iron."

"And yet," suggested Lewis, "he seems happy and contented."

"Aye—and there's the wonder. I can't comprehend it—can you?"

"I think I can. There is one way, and one way only, in which a small, weak woman can entirely subjugate and control a brusque, herculean husband. The Major is not governed against his will—in fact, his wife does not directly govern him at all. She leads him to govern himself."

Other people wondered as Dr. Rich wondered, for it was apparent to all that the doughty man of war and bluster had become a model husband.

The only man, perhaps, who did not wonder was the Major himself. He was content with the prize he had gained. Once a friend asked him if he was not governed by his wife.

"No, sir!" was his emphatic reply.

"But you do her bidding, nevertheless."  
 "I do what pleases me," said the Major, loftily; "and if it pleases me to please my wife, whose business is it?"

## THE WOES OF INFANTS.

THERE are few points on which the doctrine of the liberty of the subject is carried to such extremes as in regard to the treatment of infants. "Shall I not do as I will with mine own?" and what is more a woman's own than the baby she has borne? And so it happens that, under the cloak of mother's love and maternal responsibility, cruelty is done and crime committed which in no other relation of civilised life would be permitted for a moment. Every week we receive reports of inquests on infants who have been "done to death" by the indifference, the carelessness, the ignorance of mothers; and these do but represent the more flagrant cases—a mere percentage, it is to be feared, of the preventable infantile mortality of the country. The sour and fetid feeding bottle; the carelessly-cooked and improper food; the giving out to nurse to reckless people, whose only aim is to gain as much and spend as little as may be over the unfortunate hired-out infant; the dosing of the sickly, and therefore fretful, child with poisonous infants' preservatives; the final overlying during drunken slumber—all these are modes of torturing and killing infants, which are excused as due to ignorance and not to crime. These forms of child murder—done calmly, coldly, and with acquiescence, if not calculation—but rarely meet with punishment, while often earning the solid consolation of the insurance agent; and yet the poor woman who unexpectedly becomes a mother, and, aghast at the horror of her position, with brain blanched by hæmorrhage, and with mind incapable of intent, throws her child, in an access of wild terror, into a ditch or down a privy, she, poor wretch, is held guilty of murder. Surely the parents who bring into the world child after child only to lose them by diarrhoea, marasmus, convulsions, rickets, and other diseases due to ignorance and neglect are guilty in greater degree. It ought to be recognised that woman's work during the child-bearing period of her life is to look after her children, and that the proper way of doing so is to suckle them. To rear children artificially with safety requires more time and care than does mere suckling, but it is for the very sake of saving time and lessening care that nursing is neglected, and, in a large proportion of the cases, this is the root of children's ailments. We suppose it is idle to preach on this text, it has been done so often and with such small avail. Probably the cheapness of female labour is at the bottom of a great deal of the mischief. However slack the trades for men may be, there is almost always work for women if they will take the price, which they mostly do; and thus we see the absurd spectacle of women, in the intervals of bearing and burying a tribe of children, sewing, charring, washing, or going to the factory, besides keeping the house together, working for the purpose a daily 16 hours, while the lords of creation are doing, perhaps, three days a week, or perhaps are out on strike for an eight hours' day. And yet women marry! Evidently we are suffering from a want of correlation between the evolution of man and the progress of what we are pleased to call civilisation. New conditions require new men; whereas man still retains within him the instincts of the savage, which are sexual. The man of to-day ought not to marry until he has reached a time of life when he has been able to put by for a home; and those who know how far man yet is from perfection, will recognise how many woes the babies of the future are likely still to bear.—*British Medical Journal*.

THE DOCTOR'S ADVICE.—Mother—Now, Violet, can you give me any reason why I shouldn't punish you?

Violet—Es, I tan; ze doctor said 'oo mustn't take any v'ilent excise.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 11d. and 2s. 6d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 34 stamps by the Maker, E. T. TOWLE, Chemist Nottingham. Beware of imitations, injurious and worthless.

## THE TEETH.

TIME was when the child with a "sweet tooth" was incessantly warned that the indulgence of its appetite for candy and sweets would cause a destruction of all other teeth at a very early age. This gentle fiction was perpetuated, doubtless, quite as much to save the contents of the sugar bowl, or the jam pot, as the youthful molars and incisors; in fact, it must be conceded that pure sweets in moderate quantities are not hurtful to the teeth. Acid is much more to be feared, whether it comes from an acid condition of the saliva, or from the too free use of acidulated food. The latter can be corrected by reforming the taste of the individual, or forbearing to gratify it; an acid condition of the system is certainly indicated by tests known to science, though it is often announced by a gritty, sharp sensation of the teeth, due to the action of the acid upon them. Any of the familiar antacids may be used as a corrective; but in this matter, as in so many others, the trifling expense of medical consultation is, in fact, the truest economy.

The enamel of the teeth is not sensitive; it may be filed, cut, or broken, and so long as the operation does not extend beneath this flint-like crust, no pain will be experienced. Decay, therefore, which begins with the enamel, is in itself painless, till it has proceeded so far as to affect the pulp, either directly or through the sensitive little nerves which penetrate the dentine. It is to detect decay in unsuspected localities, therefore, that the services of the dentist should be employed for frequent inspections. Neither the sufferer nor the dentist can infallibly locate the source of toothache which proceeds from other causes than pulp-exposure. The pulp in an outwardly sound tooth may be affected, causing the most intense pain in some other part of the face, through the agency of sympathetic nerve action. Neuralgia may originate from a decaying tooth; yet as it is a disease which operates along the nerves, its apparent manifestation—the seat of pain—may be far from the actual cause. A dull pain about the roots of the teeth may be caused by the recession of the gums, exposing that portion of the tooth to the influence of heat and cold; while an enlargement of the roots, which sometimes occurs, gives rise to a particularly annoying pain and pressure. "Jumping toothache" originates in a peculiar state of the pulp caused by a very small orifice through the dentine, and the fact that this excruciating agony seldom re-appears in the same molar after having once subsided is explained, not as many persons suppose by the fact that "the tooth has jumped itself to death," but that the opening has been enlarged by the process of decay.

Inflammation is a frequent accompaniment to toothache, resulting in the formation of pus, or a "gum-boil," which may lead to serious disfigurement if it chances to open through the outer surface of the cheek, leaving a life-long scar. Where it opens inside the mouth the results are less serious, and in many cases an inducement to do this is about all that physician or dentist can effect till the pus has been discharged and the inflammation and swelling subside. In such cases the careful treatment of a dentist is indispensable. There is always danger that the pus may be discharged from the original sack in such manner as to be re-absorbed into the system, causing blood-poisoning.

The extraction of teeth is usually accompanied by a slight flow of blood, which ordinarily ceases before the patient quits the dentist's office. Where this is not the case, or where the hæmorrhage breaks out afresh when medical advice is not at hand, it should be borne in mind that the first and most natural check is the clotting of the blood in the cavity, and this should not be disturbed. If it is necessary to rinse the mouth, let it be done very carefully, so as not to dislodge the clot, if one is forming. Where this does not occur, the first recourse should be to an astringent, and tannin is the best of all. If that is not at hand, finely-powdered alum will answer very well, burnt cork may be sprinkled over the surface, or a little ball of spider's web,

lightly pressed into the wound, may answer the purpose when other means fail, as this pest of every housekeeper is an invaluable styptic. In addition to some of these, a compress may be necessary, and an article which will answer all purposes may be made for an emergency by cutting a V-shaped slit in a cork of the right dimensions to pass over the wounded gum. This may be lightly pressed into place by the teeth of the other jaw, and as it is applied, a pledget of lint or similar dressing may properly be fitted to the cavity, though often the compress alone will prove effectual. It is useful, also, in such cases to maintain an erect position of the patient, either sitting or standing. Warm foot-baths are also helpful, with friction of the lower limbs, to divert the blood from the head as much as practicable. These directions and suggestions apply, of course, to such occasions as require treatment in the absence, or awaiting the arrival, of the family physician or the dentist.

Powders and washes for the teeth should be used with great care. Regarding them, especially, the well-worn, but pertinent, caution to beware of strolling venders applies with deepest import. Everyone has a desire for white and beautiful teeth, and the itinerant who boasts loudly of the power of his preparations to "whiten the blackest teeth, to look like ivory in one minute!" catches the popular ear and sympathy on the spot. There is nothing remarkable in the fact that what he claims can be demonstrated. Any chemist or apothecary can concoct a preparation which will do all this—and more. If used but a short time it will destroy the enamel, and with it, of course, the entire set of teeth; since the phenomenal result is, and can be reached only by the destruction of a small portion of the outer surface of the enamel. The result is the same whether the agent be wash or powder, since the latter simply contains the chemicals of the former in an undissolved form. All strong acids or alkalis should be avoided in the mouth, and if there is doubt as to the composition of any preparation in this respect, let it be tested with a bit of litmus paper. This paper can be obtained of any chemist and is in two colours—blue and red. The blue, if dampened with an acid solution, will turn red, and the rapidity and intensity of the change will indicate the acidity of the solution. The red indicates alkali by changing to blue, in the same manner.

Tooth-powders, as a rule, should be soluble and slightly antacid. There is a class of insoluble powders which are of the most dangerous nature, of which powdered charcoal is a notable example. These consist of fine, sharp particles, which being pressed by the brush between the teeth and gums, or lodging between the teeth, may cause the most serious results, even to the destruction of the gums or the cement. The use of the brush in connection with powders, washes, or other treatment of the teeth, should be gentle. Bleeding of the gums is always a danger signal. It shows that the skin has been broken, inviting the absorption into the system of any poisonous or foreign matters which may be present in the mouth. If the gums are very tender, a soft brush should be used, and used very gently, till they have hardened sufficiently to withstand more vigorous treatment. Even then, the liability will be to err on the side of harshness.

Tooth-brushes should be used gently to remove adherent food and the discolourations of the teeth, system and not vigour being the guiding principle. The depressions of the molars should have attention, and a quill or wood tooth-pick should be employed to keep the interstices between the teeth clear and healthy. Lime-water—the taste being disguised by the addition of a small quantity of bruised liquorice root—makes a good wash; but a simpler preparation is made by adding a few drops of aqua ammonia to a tumbler of water; or a half teaspoonful of bicarbonate of soda may be used in place of the ammonia.

"A SIMPLE FACT ABOUT" KEATING'S COUGH LOZENGES. Ask throughout the world, in any country that can be named, you will find them largely sold. There is absolutely no remedy that is so speedy in giving relief, so certain to cure, and yet the most delicate can take them. One Lozenge gives ease, gold in 13d. tins.—[ADVT.]

"The FAMILY DOCTOR conveys to its readers much Useful Information."—*The Graphic*.

The systematic care for the teeth thus outlined costs very little in time, money, or skill; its value is inestimable. Broken-down neglected teeth are a source both of shame and of danger. We cannot address a friend, unless from behind his back, without revealing to him our imperfections of denture, if such imperfections exist; but this, while naturally mortifying, is the least of the company of evils. No sooner is the mastication interfered with, than disorganisation in the stomach, and related functions of the system begins. The growth may be slow, and the manifestations pass unnoticed, but the effect is none the less certain. That class of food best adapted to supply the wastes of the body, and to give, especially to bones, teeth, and brain, adequate nutriment, cannot be taken, because "something soft" must be provided to meet the imperfections of the denture. Thus the original trouble feeds itself. But there are other dangers. The food is often swallowed half masticated, and indigestion and dyspepsia raise their protest. Stomachic troubles of every kind are well known to result from imperfect teeth, which not only interfere with the digestion, but directly furnish poison to the lungs and stomach, affecting thus the blood and the brain, and disorganising the nervous system.

These considerations are independent of the fact of loss of beauty through loss or faultiness of the teeth; and it is also well understood that perfect vocalisation and enunciation depend upon the perfect equipment of the mouth. This may be well illustrated by observing the speech of a person with but a partial dental supply. A large part of the air from the lungs escapes unused, causing a disagreeable, hissing noise, a lack of volume and timbre to the enunciation, and the appearance of imperfect lung power. To "have teeth out," and supplant by an artificial set, should be the very last resort, though it often becomes a necessity. Even an imperfect set, as furnished by Nature, is inestimably better than the best that the dentist can supply. The latter may be mechanically faultless, their colour may be most immaculate, they may (though they do not often) fit the mouth perfectly; but their beauty is a tell-tale one. The constrained poise and contour of the mouth is sufficient and unmistakable indication of the secret it is intended to hide. The rippling laugh or the charming smile has been permanently laid aside, and the counterfeit which sometimes attempts to take its place deceives no one, for it never can carry the charm which has departed. The lesson, then, is simply—begin in childhood, and care assiduously for the priceless jewels with which Nature has furnished the mouth.

## SPECIALITIES.

### THE MASTICATOR.

WE have received from the manufacturers, Messrs. Fordham and Smith, of Wormwood-street, an instrument for the finer sub-division of meat, in cases where efficient mastication presents the difficulties due to imperfections, painful or otherwise, in the teeth or gums; or, where, from enfeebled digestion, it is necessary that the food should be reduced to as fine a condition as possible before being subjected to the action of the gastric juice. We have carefully examined the invention, and conclude from its ingenious construction that it is well-adapted for the accomplishment of the objects for which it is intended to be used. It is light, elegant, easily cleaned, and not liable to get out of order with ordinary care. We have pleasure in recommending "The Masticator" as a useful addition to our dietetic armamentarium.

SINCE every man who lives is born to die, And none can boast sincere felicity, With equal mind what happens let us bear, Nor joy nor grief too much for things beyond our care; Like pilgrims to the appointed place we tend; The world's an inn, and death the journey's end.—*Dryden.*

BIRDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

## THE NOSE.

THE nose must be considered the unfortunate member of the countenance. It is bound to grow in any shape which pleases a capricious fate, subject to no rule or possibility of restriction. Its prominence has often to be deplored, especially when the contour is something that one wishes to have hidden; for there it stands, in the centre of the face, more prominent than a lighthouse off a rocky coast, the first to catch the eye of a friend, the last to arrest the attention of a casual acquaintance. Unlike some of its fellow members, it has no expression of its own worth speaking of; and what it has is of the reverse order. The plain mouth may break into a smile to touch the coldest heart with a gleam of sympathetic joy; the dullest eye may light up with a gleam of radiance wholly unlooked for; but any such attempt on the part of this awkward attachment only ends in distortion. The "expression" of the nose is best in its natural state and its normal condition.

There is, of course, the model nose, well-proportioned, in keeping with the features it accompanies, beautiful, even; but even then it gets no credit, painters do not dwell upon it, poets do not sing it, lovers do not apostrophise. The novelist simply describes it as "shapely," and passes on to other and more charming objects. Fortunately the functions of this organ are simple, and but few words are necessary in regard to its treatment, since the diseases to which it is subject are few.

The most frequent, especially in childhood, is bleeding at the nose, and that is rarely dangerous. It often relieves an overcharged blood-vessel, and ceases without treatment when the pressure of blood has been modified. If the hemorrhage seems excessive, allow a clot to form by gently stopping the nostril. The application of cool water externally is helpful, as it repels the blood from the head, and an upright position should be maintained. Rinsing or blowing the nose, while the bleeding is in progress, tends to aggravate the trouble. The hands and feet should be kept warm, to equalise the circulation, and hot foot-baths may be found very useful. The famous Dr. Agnew, of the hospital of the University of Pennsylvania, is reported to have recently discovered a simple means of stopping obstinate cases of nosebleed, which is so practicable in every household as to merit a trial. This was simply to press two cylinders of bacon into the nostrils, when the bleeding stopped at once. It was doubtless owing to the speedy formation of a clot that this result was reached; but whatever the philosophy, the simplicity of the remedy renders the trial easy.

There is another disease, well-nigh universal, which involves the mucous lining of the nose, in connection with that of the neighbouring parts—an obstinate and offensive one. Catarrh is called the American disease, and it is a very burdensome and repulsive affliction. Inasmuch as it baffles the skill of most physicians, and has filled the chemist with a multitude of would-be remedies, competent medical advice should always be sought at its first manifestations. Its cure, after it has been neglected and become chronic, is a matter of doubt. Competent medical opinion is not wanting, however, to the effect that a simple change of habit will do much as a preventive measure, and also to assist in the cure. "Let our people learn to breathe as Nature intended they should breathe, through the nose," said a prominent physician in discussing the matter, "and the evil of catarrh will speedily disappear." This may be a sweeping assertion, but it is worthy of notice that nearly all cases of this disease appear among those who habitually breathe through the mouth.

It may not be amiss in this connection, to advise the reader to avoid travelling pretenders and extravagantly puffed nostrums. In any serious disorder affecting any portion of the head, especially, one cannot afford to employ other than competent medical talent, since unskilled experimenting may result in life-long misery or something worse.

HE that wills a thing succeeds to it; but the most difficult thing in the world is to will.—*Le Maistre.*

## A HINDOO LOVE LETTER.

IN the *Indian Mirror* appears the following letter, which throws a curious light upon "match-making" in India. It is the letter of a lover to his would-be father-in-law:—"We have received your card. The points have been carefully considered, and brought to an amicable settlement. It is through my persuasion that the parents are ready to cast their only son in lot with your daughter. But, sir, I must ask you to be a little more liberal. I am a go-between, and concessions and compromise must be made in order that the matter may be brought to a head. Your are to bear the following expenses:—1. Rs. 1500 cash; 2. Rs. 1000 ornaments; 3. The whole charge of my education up to the B. L. Examination. Taking into consideration the time we live in, and the society we deal with, you are not to lose by the bargain. Rather we shall be lowered, and our prestige gone. However, we know not what mysterious attraction draws me to you. If you meet the above demand, I shall make everything square for you. My power is paramount, though I am obedient and submissive. I must call your attention to the importance of the third demand, made above. The other demands you will meet at the time of the marriage, and there is no danger, but the other demand, which is submitted through my express desire, is liable to run the risk of breach of faith. I will live with you under the same roof. I will be your son and you my father, and my whole prospect depends upon your honesty. My father withholds from me every expense for my college career, and you are entrusted with his honourable position. None will respond to the proposed match but my humble self, and the whole odium or praise which is to ensue as the result of the match shall fall upon my head. Therefore, I urge you to think over the matter, for we are proceeding to a very solemn problem of life. The problem must be solved, and it is to be done through your unlimited benevolence. Tell me, sir, most candidly, how does your daughter look? Is she really a beautiful girl of eleven? For upon this fact depends the whole question. If your daughter be not a fair lady, it would be of no avail. Everything shall be undone, but I hope you are strong in that point, as you have often asserted it to be. Reply sharp, and write on a stamped envelope, otherwise the letter will fall into the hands of my father. Be up and doing, and write me quick. For, upon the receipt of your letter, we will start and see your daughter, and bring the matter to a close."

## GLEANINGS FROM FAMOUS AUTHORS.

THE soul without imagination is what an observatory would be without a telescope. As the imagination is set to look into the invisible and immaterial, it seems to attract something of their vitality; and though it can give nothing to the body to redeem it from years, it can give to the soul that freshness of youth in old age which is even more beautiful than youth in the young. It always seems to me that, before we leave this realm, deep affections take hold of the life to come by the hands of ideality, so that this quality in the old hovers upon the edge and bound of life, the morning star of immortality. Thus it is with men as with evening in villages. The lights in some dwellings are extinguished soon after twilight, in others they hold till nine o'clock; by one they go out, until midnight; but a few houses there are where the student's lamp, or lover's watching torch, holds bright till morning pours their light into the ocean of its own. So, such men bring through the flooded hours of darkness the light of yesterday into to-day, and are never dark, and never die.—*H. W. Beecher.*

LONDON'S STREET MUSIC.—Do you know that music of the obscure ways to which children dance? Not if you have only heard it ground to your ear's affliction beneath your windows in the square. To hear it aright you must stand in the darkness of such a by-street as this,

and for the moment be at one with those who dwell around, in the bleak-eyed houses, in the dim burrows of poverty, in the unmapped haunts of the semi-human. Then you will know the significance of that vulgar clanging of melody; a pathos of which you do not dream will touch you, and therein the secret of hidden London will be half revealed. The life of men who toil without hope, yet with the hunger of an unshaped desire; of women in whom the sweetness of their sex is perishing under labour and misery; the laugh, the song of the girl who strives to enjoy her year or two of youthful vigour, knowing the darkness of the years to come; the careless defiance of the youth who feels his blood and revolts against the lot which would tame it; all that is purely human in these darkened multitudes speaks to you as you listen. It is the half-conscious striving of a nature which knows not what it would attain, which deforms a true thought by gross expression, which clutches at the beautiful and soils it with foul hands.—George Gissing.

## NEURALGIA. HOW TO TREAT IT.

**F**ACIAL neuralgia, which is also known as "tic-doloureux," is much more prevalent among women than men, and is usually caused by some nervous strain, exposure to cold, or mental excitement. Neuralgic pains may be distinguished from most others by not being associated with inflammation, fever, or any structural change in the parts affected. We simply know they are in connection with a weak condition of the nerves, for we can trace the pain along the course of the nerve. Neuralgic pains are mostly felt in the head or in the abdomen. If they result from cold the local application of menthol or some stimulating liniment will usually be found to give relief, and oftentimes dispel the pain altogether. But when the pains are the result of a weakened condition of the nerves, internal remedies must be resorted to. At the same time we generally find a weak state of the nerves means imperfect bodily health, so that it is advisable to strengthen the system generally. For temporary relief I know of no remedy to equal the resinoid obtained from the root of the yellow jasmine, and known as Gelsenun in combination with quinine. Given in the form of one or two Quinine and Gelsenun "palatinoids" every three hours, their effect is sometimes almost magical. These palatinoids, which afford a tasteless method of administering the drug, may be obtained from any chemist. At the same time remember that the action of these is to afford temporary relief only, and systematic tonic treatment must on no account be neglected. For this purpose you cannot do better than take that most excellent tonic and restorative, Cream of Malt with Oil and Hypophosphites (Oppenheimer's). Take it regularly, not by fits and starts, it will form flesh, make bone, and thoroughly strengthen the nervous system. It is this preparation which is given to consumptives, to the debilitated, and to sick people during convalescence. Hot and cold water douches over the course of the nerve have been recommended, while the Turkish bath and massage have many advocates. Take a good morning walk in the fresh air, which, while refreshing, will greatly aid medicinal treatment in the cure of the complaint.

## OUR OPEN COLUMN.

### CORRESPONDENTS' OPINIONS.

EARTH-TO-EARTH BURIAL AND CREMATION  
TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I shall thank you heartily if you kindly allow me to write in your columns the substance of what I said during the debate on the disposal of the dead at the Church Congress. The Burial Service is the Church's authoritative document on the subject of the disposal of the dead. The first rubric permits the body to be carried direct to the grave, instead of into the Church, when there is danger of infection; while other rubrics manifestly enjoin a mode of burial which, if properly carried out, is in conformity with sanitary law. This being so, it may be inferred that all other supplementary, or exceptionally necessary, precautions are to be welcomed and acted upon. Mourners are not expected to do anything, or leave

anything undone, to the imperilling of their own welfare, or that of the public at large. The disposal of the dead is in the main a sanitary question. Consequently, if sanitary authorities are at one in deeming the burial of infective germs fraught with danger to the public health, there is no reason why such germs should not be destroyed before burial, by the use either of some chemical compound or of fire. In this connection the words of committal, "Earth to earth, ashes to ashes, dust to dust," are suggestive. While, however, cremation seems admissible under exceptional circumstances, it is quite certain that simple literal "earth-to-earth" burial is the mode contemplated in ordinary circumstances. The rubrics, "while the body is made ready to be laid into the earth," and "while the earth is being cast upon the body by some standing by" are conclusive upon this point. It only remains for sanitary authorities to set forth for general acceptance a scientific mode of burial which shall be innocuous. To this end the deputation of the Church of England Burial, Funeral, and Mourning Reform Association last January urged the Home Secretary to institute, not only an inquiry into the better certification of the cause and certainty of death, which that gentleman graciously promised to do, but also an inquiry into the effect of "earth-to-earth" burial upon the water courses below, the soil around, and the air above, burial places. There is every reason to be thankful for the Parliamentary Committee of Enquiry which has issued so admirable a report. An appeal will be made to the Government to continue its good work by instituting an inquiry into the whole question of interment. With many thanks for your courtesy.—Yours, &c.,  
F. LAWRENCE, Hon. Sec.,  
Church of England Burial, Funeral, and Mourning Reform Association. Westow Vicarage, York.  
Oct. 10th, 1893.

### EARLY TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.  
SIR,—I think if tight-lacing is begun early it becomes second nature to a girl to live in tight corsets. My husband is an enthusiastic admirer of a tight-laced figure, and corsetted my daughter in whalebone stays when barely eight years old. They were laced fairly tight, sufficient to clasp the figure very firmly. At the age of eleven, she wore beautiful long-waisted, heavily-boned corsets, which were laced tightly, and made her figure like an hour glass. They did not affect her health in the slightest, but merely prevented her playing and romping about. She is now a fine large girl of sixteen, and wears of her own accord exceeding tight-laced stays, which keeps her figure in perfect shape, and are so boned as to force her well-formed bust upwards, and outwards. A lady, who saw her photo, remarked that a girl laced so tightly must be in torture; however, when she met the girl, she changed this idea. My daughter has become so used to the life-long corset pressure and restraint that, out of a tight-laced corset she would be most uncomfortable. I may mention that within the last day or two, her father is getting her winter-dresses made, and to please him she is measured in extra and smaller wasp-waisted corsets. Her father allows her always to wear gloves and high-heels.—Yours &c.,  
MARY T.

## Notes & Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

### QUESTIONS.

GRAPES.—Is the bloom on the fruit injurious to health, and should it be wiped off before eating? Or, on the other hand, is it something which is beneficial to be eaten with the grape?—J. Doulton.

### ANSWERS.

TURKISH BATHS.—In answer to "Novice" I may say I am a great believer in Turkish baths, and take them regularly, and find them of great assistance to me. I do not go to a public bath, but have a cabinet one in my room, and in many ways I think this is best. One advantage and a great one is, that you get into bed as soon as it is over, and therefore neither risk cold nor feel done up by it. I gave fifty shillings for my bath second-hand, and have used it a great deal, both for myself and others. It is wonderfully useful in cases of almost any kind of pain. I shall be happy to write to "Novice" if he likes to ask me any questions.—Rev. H. S.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR OF THE FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London. W.C.

### ADVICE GRATIS.

By A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS their ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

### The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:

King's College Hospital.	Nazareth House, Ham-
University College Hos-	mersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

X. Y. Z., Belfast.—We have too much respect for water, and you swallow too much albuminous food to the exclusion of farinaceous diet. Take no porridge, give up the cocoatina, and eat less meat. Drop the Turkish bath, which evidently does not do you any good. Take the following pill daily with dinner: Blue pill one grain, compound rhubarb pill two grains, pill of colocynth and henbane one and a half grains, and the following mixture before each meal: Dilute hydrochloric acid ten minims, chloride of ammonium ten grains, sulphate of soda fifteen grains, tincture of gentian half a drachm, water to half an ounce. Try this method for a month, taking your weight row and at the end of the time. Eat plenty of stale bread, but avoid coffee and sugar. Weak tea with milk will suit you very well at breakfast and bedtime, and were you not an abstainer an occasional glass of good bitter ale with meals would have been of service to you. The varicose can only be cured by operation; the palliative measures suggested in your case are utterly useless where the condition is pronounced.

SUFFERER.—Your case is undoubtedly accessible to remedies but not those drugs generally in use. You had better send a stamped addressed envelope reminding us of your case, and we will write and advise you.

DEBILITY.—It is most unfortunate that you should have married while suffering as described. Doctors who recommend that step exhibit only ignorance or carelessness in doing so, as it is calculated to intensify the conditions from which you were already suffering. You must live apart for three months, meanwhile you had better consult a specialist, as medicines would be useless, and you probably require active electrolytic treatment.

G. M. No. 2.—It is utterly impossible to gather the present state of your health from the scanty information with which you have supplied us. In fact, we very much doubt whether you could supply as much information as would be necessary to enable us to treat your case properly. Nothing short of seeing a doctor will be any benefit to you. You had better send a stamped envelope and we will tell you where to go.

PERPLEXED.—There are so many of you who are "perplexed" that your perplexity will be increased when the replies to your queries arrive. After having tried everything else, you have a choice of two more remedies, one or both of which may be employed—viz., circumcise and galvanism. You appear to have exhausted all other treatment.

J. HAWKINS, London.—We do not see what connection the one can have with the other. She had better try a poultice or two over the painful part, or a belladonna plaster, and take the following medicine: Bromide of potassium one and a half drachms, syrup of oranges two drachms, chloroform water to six ounces. One sixth part three times a day. If this does her no good it would be better to see a doctor.

SATIS SUPERQUE.—The headache is of course due to indigestion. Of course you can sing and marry too. Probably both will benefit. With the mixture we should suggest your taking the following pill: Arsenious acid one-thirtieth of a grain, carbolic acid one grain, extract of gentian one grain, to make one pill, to be taken three times a day with a dose of the mixture.

A. STUART.—Take the following pill daily with your dinner: Colomel one-third grain, extract of gentian three grains, extract of nux vomica one-quarter grain. This should be taken daily for a month, when you ought to report again. As a gargle use a teaspoonful of common table salt to a quarter of a pint of water once or twice a day.

HUDSON'S EXTRACT OF SOAP  
AND  
HUDSON'S DRY SOAP.

WILL NOT JAG YOUR JOINTS

## RECOMMENDED

For the preservation of lawns, laces, beautiful washing fabrics, underwear, fine linen, shirts, sheets, &c., HUDSON'S EXTRACT OF SOAP AND HUDSON'S DRY SOAP are recommended. Instead of the offensive soapy smell common in many Soaps, HUDSON'S leaves the linen actually sweeter and fresher than when new.

"The FAMILY DOCTOR contains a vast amount of really Practical Information."—Reynolds.

# DISINFECTION.

## KINGZETT'S

(PATENT)

### SULPHUR FUMIGATING CANDLES ARE PERFECT

And afford the best means of Preventing and Arresting the Spread of Cholera, Fevers, and all Infections by Fumigation with Sulphur.

They can be lighted with the greatest ease, and burn steadily and thoroughly.

6d. Size.

1s. Size.

Full Particulars will be Sent on Application.

**THE SANITAS Co., LTD.,**  
BETHNAL GREEN, LONDON.

(Sole Manufacturers also of the famous "Sanitas" Disinfectants.)

C. H. G.—We are glad you have given up the objectionable habits, for they are physically and morally pernicious. But you must not give way to melancholy as you appear to be doing. Take the following mixture three times a day, and if not better in six weeks, write again: Carbonate of ammonia three grains, bromide of sodium twenty grains, sulphate of magnesia half a drachm, infusion of gentian to half an ounce. Keep up the cold bathing, and comply with the other suggestions alluded to.

N2 EAGLE X.—You have omitted to mention your age. You need not fear any dislocation of the thigh bones, as you would find that exceedingly painful and it would be impossible to walk. The chances are that you are growing very fast, and the strength of the ligaments surrounding the knee joints does not keep pace with the development of the legs themselves. Very little can be done in the matter, you may bathe the knees with salt water and rub vigorously with a rough towel. Take a teaspoonful of Pariss's Food three times a day immediately after meals.

ANOTHER SUPPHER.—If the powder we recommended has not produced beneficial results we should advise you to use zinc ointment, containing five drops of creasote to the ounce. This must be applied night and morning, having previously washed off the former application with warm water. If this does no good you had better see a skin specialist. Take at the same time the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia three drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day.

130th Thousand Post free of Author, 2s. 6d.

## THE CURE OF CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, & CATARRH.  
By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S., Late M.R.C.S. Eng., late Consulting Surgeon to the Lower Clapton Orphan Asylum, &c., Lynton House, Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

ROSIE.—You have not given us many details of your case, though we appreciate the difficulty of stating it as well as if replying fully in these columns. If you will send us a stamped addressed envelope with a letter containing full details, we will reply to you by post. Meanwhile take the following mixture night and morning: Bromide of potassium twenty grains, carbonate of ammonia three grains, glycerine twenty minims, tincture of bark half a drachm, water to half an ounce.

A. T.—We have no personal knowledge of this gentleman's skill, either as an aural surgeon or as an electrician. It is not usual for medical men, in consulting practice, at any rate, to sell surgical or medical appliances *verbum sap.*

MARY ELLEN.—You have our sincere sympathy in the terrible series of afflictions undergone by the unfortunate patient. The original trouble did not follow small-pox, nor are the more recent pains "the after-effects of influenza." The history is perfectly clear, and in reply to your question as to whether "it is of any use having further advice" we have no hesitation in replying in the affirmative. Much good may be done by a prolonged course of specific medicines, but the dose and character of these can necessarily only be determined after personal examination of the patient. We think that had a proper diagnosis been made in the first instance, and the requisite treatment administered, most, if not all, of the ravages of the disease might have been nullified. If you wish to communicate with us further please enclose a stamped envelope with your letter, and we shall be happy to reply privately.

PUZZLED.—There appears from your letter to be no obvious cause for the conditions, and in order that something may be done for it, a personal examination of the parts is necessary. If you send us a stamped addressed envelope restating your wish, we will give you the address of a physician making a special study of such cases, and who will exercise the greatest delicacy of treatment, and will respect your susceptibilities.

J. F. V.—As you discharged yourself from the hospital without the advice of the surgeon, your doubt is probably well-founded, and we should recommend you to see the same surgeon as soon as possible. Reference to his notes and the present state will soon place the trouble in a clearer light.

G. M. B.—Your symptoms appear to be all attributable to the same cause. 1. Yes. There can be prevented, partial by general treatment, entirely by local electrolytic measures. 2. Use hot water with good soap (Terebene or Juvenia); rub the face thoroughly with the towel after drying. Before each meal take the following mixture: Dilute phosphoric acid ten drops, tincture of nux vomica five drops, water to half an ounce. 3. Yes, unless treated by a properly qualified medical man. 4. Not generally, though it might have some influence on their nervous systems.

POTTERIES.—No doubt you will require a good deal of the proper kind of treatment for such cases, but that treatment does not consist in drugging yourself with all kinds of nauseous medicines. The treatment will have to be local and directed to one point, by means of an electric current. You may not be able to obtain this treatment where you are; if not, we shall be happy to tell where you can.

A. X. S.—You do not allege any reason for the frequent losses which are usually the result of former indulgence in bad habits. Learn to pass a bougie (No. 9 English) twice a week; do not sleep on your back, pass water when you first wake in the morning, take plenty of outdoor exercise, take no heavy suppers nor anything to drink after nine p.m. Take also twenty-five grains of bromide of potassium each night at bedtime in an ounce of camphor water. If you do not rapidly improve, you had better consult a London specialist physician.

DESponding ONE.—You probably require change of air and scene. Take a cold bath every morning having first washed down afterwards with a rough towel. Get plenty of regular active outdoor exercise every day, not walking, but gymnastics and athletic sports. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Your meals must be regular and consist of plain nourishing food. Your health will not improve in strength and quantity until your bodily health is restored. The more applications you make to it, the more likely is it to come off. Go on with the Fellow's Syrup.

PERPLEXED, Dublin.—You will be very foolish indeed if you do not accept the offer. Do not trouble about your mother. That may or may not have been so.

ANXIOUS.—Take a cold or tepid bath every morning and keep the bowels freely open. Avoid spirits if they have the effect upon you that you complain of. Give yourself a rest in the matter and do not indulge too frequently. Take the following medicine: Dilute phosphoric acid one drachm, sulphate of quinine six grains, tincture of cantharides fifteen minims, tincture of nux vomica half a drachm, chloroform water to six ounces. One-sixth part three times a day immediately after meals. It is this does no good, send stamped envelope.

A. CONSTANT READER.—You have evidently caught the infection by contact with some person or thing already infected. It is easily cured by washing thoroughly with hot water and soap (twice a day), and when dry applying some ointment of ammoniated mercury (not too freely) over the itching surface. Two or three days should suffice to get rid of the trouble. Of course you must change your underclothing frequently.

PALE ANNIE.—You will always be pale while you continue to eat raw rice. Give up the habit at once, for it is likely to lead to much more serious consequences than are at present perceptible. When you have done so you will be ready for the iron and quinine medicines which the doctors have already ordered for you.

## FAILING EYESIGHT

Persons suffering from Defective Vision (particularly those who have been unable to get suitable glasses elsewhere), should consult Mr. Bluett, who has had thirty years' practical experience in making and adapting Spectacles for every form of Defective Eyesight, and for which he has received numerous unsolicited testimonials.

The Eyes Carefully Examined and Sight Tested FREE. Spectacles from 1s. 6d. per pair.

ORGANETTES  
4/6  
MONTHLY

Plays Hymns, Popular Airs, Quadrilles, Waltzes, Hornpipes, &c. A mere child can play it. Cash or easy payment. List of tunes and full particulars free.

DRAPER, ORGANETTE WORKS, BLACKBURN.

J. S. McMILLAN.—You take too many eggs and not sufficient meat. A vegetarian diet? Certainly not, unless you wish to aggravate all the conditions. Vegetarianism, for anybody, is a grievous mistake, and those people who advocate it forget that our digestive organs are not those of herbivorous animals. Eat your food slowly, drink only after meals, and take the following mixture night and morning: Bicarbonate of potash fifteen grains, sulphate of magnesia seventy-five grains, tincture of gentian half a drachm, cinnamon water to half an ounce.

WEARY ONE.—Pass the bougie twice or three times a week, and take the following medicine: Sandalwood oil half a drachm, mucilage of acacia half a drachm, cinnamon water to half an ounce, three times a day after food. If you have a varicose, it will be necessary that you undergo an operation for its radical cure.

HOMER.—The cause is dryness of the scalp and skin of the neighbouring parts due to the proximity of the lamp to your head for so many hours. Try the effect of keeping the head constantly greased with the following: Blistering fluid half a drachm, lanolin four drachms, white vaseline an ounce.

JANE DUNN, Etc.—Take ten grains of sulphonal every night at bedtime. Try this for a fortnight, not longer.

J. CLARK.—In reply to your former letter, we wrote to the address given, and are astonished to find that you did not receive our communication, as it was not returned to us. The appliances named would be useless in your case. If you wish for the other information, it would be better that you should send us an envelope addressed so that it should reach you. Is it possible that our former letter to you was opened by someone else?

DONNE.—The abandonment of the pernicious habit depends upon your own strength of will. There are, of course, artificial aids, such as blistering, &c. But without determination on your part they can only be disappointing. The operation of circumcision, however, is pretty effectual, and if you find other measures useless, you will do well to arrange for the performance of that operation.

W. M.—Avoid all beer, wine, and spirits. Keep the bowels freely open by means of a teaspoonful of liquorice powder nightly. Take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals.

ONE IN GREAT TROUBLE.—You had better place her under the care of a doctor, because, even if you use sulphur ointment, you will not know when the disease is cured; you may use too much of the ointment and produce eczema. It is not improbable that the boy has caught it, though we could not tell without examination. For yourself, you should avoid all beer, wine, and spirits, and take the following: Sulphate of magnesia three drachms, carbonate of magnesia two drachms, peppermint water to six ounces. One-sixth part three times a day.

PERPLEXED.—Of course the best thing you can do to satisfy yourself is to see a specialist. Send a stamped addressed envelope, reminding us as to what your trouble is, and we will recommend you one. The condition is due to your state of health, it does not, therefore, follow that you should be like all this your life.

G. M. M.—1. Ammoniated tincture of quinine is the best thing. 2. Either will do, the combination does not act better than one alone. 3. Not that we are aware of. 4. Yes.

ENGINEER.—We do not think there is anything to prevent your passing the physical examination. However, to make sure, perhaps it would be better to see someone.

DUBO.—1. Take a cold bath every morning and get plenty of active outdoor exercise during the day. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and followed the next morning by a mild dose of aperient fruit salts. Take the following medicine: Bromide of potassium one drachm, syrup of oranges two drachms, chloroform water to six ounces. One-sixth part three times a day. 2. We know nothing about it. 3. Yes.

SARLET.—1. Wash the head with a little warm water once a fortnight, thoroughly dry and apply a lotion like the following every morning: Spirit of rosemary three drachms, dilute acetic acid one and a half ounces, tincture of cantharides six drachms, tincture of nux vomica half a drachm, tincture of capsicum one drachm, aqua of roses two drachms, rose-water to six ounces. To make a hair wash, to be used every morning. 2. Take three grains of calomel every other night, followed by a scidlitz next morning. Avoid beer, wine, and spirits in any shape or form; also sauces, pickles, &c., &c. Take plenty of active outdoor exercise and a cold or tepid bath every morning, using plenty of soap. The carbolic acid lotion is useless. Take sulphur ointment, one drachm, carbonate of magnesia two drachms, peppermint water to six ounces. One-sixth part three times a day.

TOO LEAN.—If you do not get fat on your present form of diet there must be some good reason for it, such as inherited thinness. If, however, you are thin by inheritance, we very much fear nothing will make you stout, especially as you have to take so much exercise. With regard to your hair, light hair frequently becomes darker with years. We do not think you can do anything to make it lighter, unless you use a bleaching agent.

**SELLERS' CLEANSING AMMONIA** is a perfect boon to every household. A little added to the Bath softens the water, cleanses the skin, promotes health and vigour, and secures all the benefits of a Turkish Bath without any risk or inconvenience. It is most refreshing for Toilet use, and makes a splendid wash for the Hair. For Laundry use it saves Soap, Soda, and Labour, prevents flannels shrinking, and makes Linen as white as snow. In bottles, 6d. & 1s. each, with directions for use. Sold by Chemists, Grocers, &c., or from J. SELLERS, 57, Farringdon Road, London, E.C.

## ECZEMA.

SIR,—After TEN YEARS suffering and irritation your "VELVET" has cured my leg. It has been worth TWENTY POUNDS to me.—JOHN JARVIS FOVANT.

"VELVET," a beautiful Cream for Eczema, and all roughness of the skin. 134d., or by post 15 stamps from E. J. ORCHARD, Chemist, Salisbury. Please mention this paper.

**EPPS'S**  
GRATEFUL—COMFORTING.  
**COCOA.**

**C. A.**—Take baths during the winter at the temperature of the room in which you sleep; no necessity to take them absolutely cold. You should keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, chloroform water to six ounces. One-sixth part three times a day immediately after meals. Give up the hot water drinking, you have tried that long enough.

**OLD MAID.**—Every night at bed time take a small teaspoonful of compound liquorice powder in water, and during the day fifteen grains of bicarbonate of soda, dissolved in half an ounce of peppermint water, an hour after each meal.

**T. WILSON.**—1. Yes. Chest-expanding braces, made by Bailey and Son, Instrument makers, Oxford-street, London, W., will help you in the matter. 2. We do not understand the description given of the legs. 3. Bathe eyes if you like, but neither bathing nor all the internal medicine ever ordered will do away with the necessity for glasses which you allege. Take ten drops of tincture of perchloride of iron three times a day with a sufficient quantity of water—say, half an ounce.

**DITTIERS.**—1. Your food is altogether with the exception of the meat and butter, practically "preserved food." You want fresh fish, fresh green vegetables, fresh fruit, and occasionally some poultry. Too much farinaceous food—as you appear to have—is a mistake, and is apt to constipate. You had better carry out the suggestions made, and take one teaspoonful of Epsom salts, dissolved in hot water, a short time before going to bed each night.

**AGGY.**—It is quite likely the poor child is suffering from worms, but we are not in a position to say so without an examination. Besides, the treatment for worms requires the superintendence of a medical man. The symptoms you allege may all be attributable to the presence of worms. You had better take her to a good doctor, and let him prescribe for her. It is very dangerous for you to be giving her worm powders on your own responsibility.

**FOUR-INCH.**—This black deposit on the inner side of the teeth is tartar, a deposit of salts from the saliva. The only way to remove it is to go to a chemist and have it scraped off. It is better to have this done than to allow it to remain there, because the enamel under the tartar becomes destroyed, and decay of the teeth may set in. 2. This boughie should go in for about eight inches, but if you cannot use it without pain you had better leave it alone, or you will do yourself more harm than good.

**ICONOCLAST.**—We are not prepared to give a diagnosis on such scant information as that you have afforded us. A "pain in the back" need not necessarily imply disease of any organ. Cold, fatigue, rheumatism, or injury may also cause it. You had better keep the bowels freely open, rub the back with a little liniment of any sort, and wear a flannel bandage round the body. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

**JOHN M.**—You are probably suffering from dyspepsia, but not from that alone. There is little doubt that you have also some enlargement of the prostate gland, which should be properly treated by a qualified medical man, and not by resort to quacks and patent medicines. The continual desire to pass water is due to mechanical reasons, which will have to be overcome mechanically. For the dyspepsia, you must look after your diet, eating only the lightest and plainest food, and take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day immediately after meals. Keep the bowels freely open, and mind you take plenty of active outdoor exercise.

**SCOT.**—This may be due to dyspepsia. You must see that your food is light and nutritious, and take the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, chloroform water to six ounces. One-sixth part three times a day, immediately after meals.

**A NEW READER.**—Why should you not eat the ordinary bread as sold at any respectable baker's? With regard to food, eat what everybody else does, unless there are any special reasons why you should not. You talk of a pain at the bottom of the ribs, as if that meant any definite position. If any one said this to you, what would you understand by it—right, left, back, or front?

**PAYTHORN LADDER.**—We have examined the sample and nothing abnormal about it. Take a cold bath every morning, and keep the bowels freely open by means of a little liquorice powder. Take plenty of active outdoor exercise.

**GEORGE THOMAS.**—Take a cold bath every morning and keep the bowels freely open by means of a teaspoonful of compound liquorice powder, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Wash the face with soap and water three or four times a day, emptying the yellow pustules by means of a sharp needle run into the base. Take care that you eat light, nourishing, assimilable food regularly for your meals, avoiding much potato, bread, pastry, and puddings, beer and wines. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

**DEPRESSION.**—We should advise a cold bath every morning with a good rub down afterwards. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed for your meals by a mild dose of aperient fruit salts. Probably you require some change of air and scene if you have not had a holiday for some little time. Have your meals regularly and eat only light nourishing food. If you are anxious about your condition see some good physician who may be able to put you on the right track.

**A. DEPRESSION.**—We very much doubt whether what you feel, namely, the oozing, is actually in consonance with the real facts. It is very unlikely, but of course may be so. If it is so, you should see a good specialist. Send a stamped addressed envelope and we will recommend you one. In the meanwhile, you must avoid sleeping on your back at night while asleep, which may be prevented by tying some hard substance in contact with the back. Keep the bowels freely open, and take a cold or tepid bath every morning.

**IVY MAY.**—You must be careful to take a full glass of the slippery elm to a pint of water, if you must use this preparation. You can get all these things at the chemist's, and he will give you all the information you desire. You can have the castle soap scented if you like, but you must also use super-fatted soaps which are better, and will be supplied by your chemist.

**TREMULOUS.**—Continue to carry out our instructions with regard to the nocturnal trouble, although it has been greatly modified. For the general nervousness you had better take a teaspoonful of Parrish's Food three times a day immediately after meals. This must be continued for a considerable time, as the nervous condition is generally obstinate. Be careful to keep the bowels freely open by your chemist.

**M.A.**—Be very careful to keep the parts scrupulously clean with plenty of soap and water, drying thoroughly. Avoid all beer, wines, and spirits, and take the following: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus three drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals.

**DURHAM.**—It is absolutely necessary that you should have medical attendance. If you cannot afford to pay a medical man it would be better for you to get a parish order and be visited by the district medical officer. We cannot prescribe for you while you are in such a dangerous condition. If you cannot sleep you had better go to a hospital. For the other matter, one drachm, syrup of orange two drachms, chloroform water to six ounces. One-sixth part three times a day. Take only light food—such as broth, beef tea, and milk—for the present.

**W. F. R.**—You must be careful to keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Have a cold bath every morning. Avoid all beer, wines, and spirits, and eat only light food. The prostatic fluid escapes on account of the straining. The other matter would require special treatment for some time and you would have to see a specialist.

**L. L. L.**—If your eyes are affected, you should certainly see an oculist, and go to some ophthalmic hospital. For the other matter, that is easily seen, light. Take the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia three drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day between meals. Take plenty of exercise and do not eat any farinaceous food, such as potatoes, bread, pastry, and puddings.

**LOVED SINCERELY.**—We know not whether we have lighted upon merely a scrap of your correspondence or whether the few inches of paper we found constitute the whole of it. At any rate, the information contained therein is insufficient to make any practical medical use of. You must write more fully and we will help you to the best of our ability.

**CLIVEDEN.**—We think the only thing that can be used beneficially for your complaint is galvanism. Drugs are of no use whatever. The best thing you can do is to get into some good London hospital or infirmary and place yourself under treatment. At home you will never get better.

**NERVOUS ONE.**—Obviously the only thing for you to do is to go to a good dentist and have them properly attended to. We cannot tell what their condition is merely through correspondence; hence we cannot say whether they should be pulled out or left in.

**GOLDEN HAIR.**—The condition of your skin is dependent upon the condition of your health. You must keep yourself in thoroughly good order if you would remain well and clear-looking. The bowels must be attended to, plenty of exercise indulged in, and suitable food eaten. It is of no use paying attention to one point unless you pay attention to all. It is of no use devoting your cares to the state of the skin when the general condition of the constitution is faulty.

**ENQUIRING.**—You should change the socks every day, and dust powdered boracic acid into the boots and shoes every time you put them on. Take a cold bath every morning, applying soap universally with a liberal hand. Attend to the state of the bowels, and let your diet be light, nourishing, and taken at regular intervals. Get plenty of active outdoor exercise of an athletic kind. Take a teaspoonful of Parrish's Food three times a day immediately after meals.

**HAROLD.**—No. No sign of consumption—but of indigestion. Eat your food slowly, drink only when each meal is done, and take the following medicines: A teaspoonful of Epsom salts each morning in water; and before each meal: Dilute hydrochloric acid ten minims, spirits of chloroform five drops, tincture of gentian half a drachm, water to half an ounce.

**GENERAL GORDON.**—You might take another cartload of medicines and apply an equal number of appliances named without relief. The varicocele must be treated by operation and the other condition by electrolytic measures. If you yourself do not know any surgeon to consult, if you let us know your address we shall be happy to recommend you a suitable man.

**A. L.**—The disagreeable sensations of which you complain may be due to polyposis or to the disease known as oozema. It is impossible to say which without examination; you had better consult a surgeon to one of the throat and nose hospitals. That at Gray's Inn-road (The Central) is as good as any.

**HARBOUR.**—A soft toothbrush is best, and camphorated chalk is as good a dentifrice as any. We have never used the substance you mention, and hence cannot speak of it personally. Wash the teeth after each meal.

**LOCK-OUT.**—We think that under the circumstances you had better continue the treatment already initiated by the gentleman named in your letter. We must confess to some surprise at the display of his qualifications, however, and we may add that as the above "physician" is considerably larger than the sum named, and does not include any medicines at all. However, the doctor is evidently well qualified, and you must be content to follow his or some other good advice for from twelve to eighteen months longer if you wish to be permanently rid of the disease.

**PRINCE.**—You had better take the following mixture regularly three times a day between meals: Sandalwood oil half a drachm, mucilage of acacia forty-five minims, peppermint water to half an ounce. You must turn testotaller, smoke very little, and keep the bowels acting regularly.

**ARISTICUS.**—Yes. It is quite possible. The probability, however, is, that in your friend's case the malformation is only apparent—not real. The other organ may still be connected with the abdomen, and that is, it may not have descended in the usual way to its normal position.

**NASAL CATARRH.**—You had better use the following lotion: Borax seven grains, bicarbonate of soda and chloride of sodium of each seven grains, powdered white sugar fifteen grains, to make one powder to be dissolved in a half-tubful of warm water, sniffed into the nostril and brought out of the mouth after traversing the nostrils. Take also a teaspoonful of Fellew's Syrup three times a day immediately after meals.

**NINA.**—We do not encourage the employment of cycles by either sex; in fact, we think they are responsible for a great many maladies. This observation applies to married women as well as to single ones. Most people can take this medicine if necessary, but it would be absurd for you to take it if it were not necessary. You had better see a doctor.

**WREKIN.**—You are evidently very much out of sorts, and require a complete change of air and scene. The bowels should be kept freely open, and you should drink plenty of good Burgundy. Take also the following medicine in the shape of pills: Sulphate of quinine one grain, extract of hux vomica quarter of a grain, aromatic acid one-sixth of a grain, extract of hyoscyamus one grain, to make one pill, to be taken three times a day, immediately after meals. These should be taken for some considerable period.

**Z. Y.**—Obtain Dr. Pye Chavasse's book on "Advice to Mothers." It is quite cheap, and may be obtained anywhere.

**T. C. S.**—We do not think that indigestion of diet will help you much—the trouble is not due to indigestion, but to that state of nervousness incidental to the period of adolescence. As you grow older you will find your difficulty disappear without needing to resort to any of the suggested drastic measures. Mix as much as possible with your fellows, make up your mind that you can easily overcome the tendency, and take the medicine herewith prescribed twice or three times each day: Bromide of potassium twenty-five grains, carbonate of ammonia three grains, glycerine twenty minims, tincture of gentian half a drachm, water to half an ounce.

**STELLIA ADAMS.**—You are suffering from leucorrhoea, which may possibly be suggestive, under the circumstances, of pregnancy. But there are many other causes, and without a full investigation of the case it would be impossible to say definitely which was responsible. However, there is no reason why you should not use a lotion containing one teaspoonful of sulphate of zinc to a pint of warm water—twice daily as an injection. Keep the bowels acting with a dose each night of liquorice powder, one teaspoonful, and if there is any further difficulty, send us a stamped envelope for reply by post.

**YEAST.**—The only way in which yeast is sometimes used by medical men is as a poultice to clean sloughing ulcers. Internally its use is valueless, though it has been tried in diabetes and other saccharine diseases. You had much better use peppin in ten grain doses after meals, or take the following: Subnitrate of bismuth one drachm, mucilage three drachms, chloroform water to six ounces. One-sixth part three times a day immediately after meals.

**THERMO.**—A discharge of this kind may accompany almost any malady connected with the nasal organs, whether it be due to a polypus, hypertrophied mucous membrane, disease of the bone, or what not. You appear to have used the right kind of thing, but not thoroughly. The chloride of ammonium inhaler must be never-used with, and the antiseptic solutions must be made to traverse the whole length of the nostrils (and brought out of the mouth). The most satisfactory way of going to work is to consult a good specialist and find out what is really the matter.

## A Natural Food.

Conditions of the system arise when ordinary foods cease to build flesh—there is urgent need of arresting waste—assistance must come quickly, from natural food source.

## Scott's Emulsion

is a condensation of the life of all foods—it is cod-liver oil reinforced, made easy of digestion, and almost as palatable as milk.

Prepared by Scott & Bowne, Ltd., London.  
Sold by all Chemists and Vendors of Medicine at 2/6 and 4/6.

WHEAT PHOSPHATES NOURISH BRAIN and FRAME.  
WHEAT PHOSPHATES FORM BONE, TEETH, and MUSCLE.  
WHEAT PHOSPHATES ENRICH the BLOOD.

Is a Cooked Food, strengthened with the MOST NUTRITIOUS FOOD in the WORLD.

For INFANTS; Developing Bones, Muscles, Teeth, Brain:

For INVALIDS; Restorative and Invigorating:

For ADULTS; A Delicious Breakfast and Supper Dish:

Increases Vigour, Restores Strength.

4-lb. Sample in HANDSOME ENAMELLED Tin sent free

on receipt of 3d. to cover postage (mention this Paper)

## EDITORIALS.

**NO NEED TO DIE YOUNG.**—Bismarck says that he owes his rugged old age to the practice of bathing regularly and freely in cold water. Gladstone ascribes his longevity to the regularity of his habits. Tennyson believed his good health was due to his not having worried about the small affairs of life. Von Moltke thought his ripe old age was owing to temperance in all the affairs of life and plenty of exercise in the open air. De Lesseps thinks he owes his advanced age to like causes. Taking all these life-giving agencies together, and considering how easy they are of attainment, there does not seem to be any good and sufficient reason why we should die young.

**SWEAT** consists of nearly 99 per cent. water and a little over 1 per cent. of saline matter.

An operation for appendicitis upon a patient revealed the fact that the disorder was due to the presence of tooth-brush bristles. "Cheap tooth-brushes," remarked the surgeon who had charge of the case, "are responsible for many obscure throat, stomach, and intestinal ailments. The bristles are only glued on, and come off by the half-dozen when wet and brought in contact with the teeth."

**PURE** water and a good brush are the only things absolutely necessary for keeping the teeth in a wholesome condition when the digestion is good, and the teeth have once been thoroughly cleaned. A little fine soap or soda is useful in acid conditions of the mouth; and a powder, such as precipitate of chalk, is valuable when the teeth have been neglected. "Salt is also highly recommended, and acts as a disinfectant."

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln.

In a square inch of the human scalp the hairs number about one thousand, and the whole number on an adult scalp is about one hundred and twenty thousand.

**PAPER** stockings are a new German invention. A Berlin shoe trade journal says that the stockings are made of a specially prepared impregnated paper stock, which, it is claimed, has an extraordinary effect on perspiring feet. The moisture is absorbed by the paper as rapidly as it is formed, and the feet remain dry and warm, while the constant temperature maintained in the shoes is said to be a great preventive of colds.

**THE DANGEROUS NUTMEG.**—Cases are not infrequently reported in which children, and sometimes grown-up persons, are poisoned by the free use of nutmegs, it not being generally known that this article of common household use is really a deadly poison. This is true, in fact, of most common condiments, but when misused these articles, such as pepper, capsicum, &c., are so obnoxious to the taste, excepting when taken in very minute quantities, that the consumer is warned in a very positive manner before he has had an opportunity to do himself serious injury. This is not the case, however, with the nutmeg. This nut, which contains a poisonous principle of a very deadly character, may be consumed without inconvenience in quantities sufficient to produce fatal consequences; and it is surprising, not that death occasionally occurs from its use, but that deaths are not more frequent.

A **WELL-KNOWN DOCTOR**, speaking of the contagiousness of common warts, says that common warts appear to arise by implantation of some contagious material at one or more points on exposed parts of the skin. There is also some idiosyncrasy, for whilst children especially are very liable to warts, others, though living under precisely the same conditions, never suffer from them. From the original wart or warts thus produced others may, by local inoculation, be set up just in the immediate neighbourhood. At any period he believes that communication to another person is possible by ordinary contact, though a somewhat close contact appears to be necessary. As to the local treatment of warts, the commonest mistake is to attempt to destroy the wart at once by some powerful caustic, this process being often painful, and, if successful, apt to leave a scar. A better method is to apply several times daily some light caustic, as concentrated or glacial acetic acid, and in this lies the main secret of successful treatment.

**MEMORY.**—Of all the wonderful miracles of Nature, animate and inanimate, there is perhaps none so perfectly and inscrutably marvellous as the human memory. We do not refer to the specially cultivated, gifted, and trained memories of exceptional geniuses; we are alluding merely to the common average human being whom we meet at every turn, whose simple innate power of recollection and reminiscence seems to us almost the very gravest marvel in the museum of the physical universe. Even the meanest memory is stored and stocked, in all its numberless cells and pigeon-holes, with such an endless collection of facts and ideas as might appal the heart of the most ardent statistician. Most people, for want of "analytical" habits, greatly underestimate the extraordinary storehouse accommodation of their own memories, and we believe the merest child or the most ignorant peasant knows and remembers a number and a variety of things which, when collected, would readily surprise the most learned and thoughtful. Where the room can be found in one small brain to stow away so many facts and fancies is a puzzle of no small magnitude. Cell after cell and fibre after fibre in the innumerable minute elements of the brain have been indissolubly connected by channels of nervous communication impressed and modified by acts and ideas, till the whole has become a supreme register of past experiences ready for reference at a moment's notice by the wonderful power of association.

**HOW WE TASTE.**—Strictly speaking, with the tip of the tongue one cannot really taste at all. If you put a drop of oil of bitter almonds on that part of the mouth you will find that it produces no effect of any sort; you only taste it when it begins slowly to diffuse itself, and reaches the true testing region in the middle distance. But if you put a little mustard or cayenne on the same part, you will find that it bites you immediately—the experiment should be tried sparingly—while if you put it lower down in the mouth you will swallow it almost without noticing the pungency of the stimulant. The reason is that the tip of the tongue is supplied only with the nerves of touch, not nerves of taste proper; they belong to a totally different main branch, and they go to a different centre in the brain, together with the very similar threads which supply the nerves of smell for mustard and pepper. That is why the smell and taste of these pungent substances are so much alike, as everybody must have noticed, a good sniff at a mustard pot producing almost the same irritating effects as an incautious dose.

**LAUGHTER.**—Laughter has often dissipated disease and preserved life by a sudden effort of nature. We are told that the great Erasmus laughed so heartily at a satirical remark that he broke a tumour and recovered his health. In a singular treatise on "Laughter," Joubert gives two similar instances. A patient being very low, the physician, who had ordered a dose of rhubarb, countermanded the medicine, which was left on the table. A monkey in the room, jumping up, discovered the goblet, and, having tasted, made a terrible grimace. Again putting only his tongue to it, he perceived some sweetness of the dissolved manna, while the rhubarb had sunk to the bottom. Thus emboldened, he swallowed the whole, but found it such a nauseous potion that, after many strange and fantastic grimaces, he ground his teeth in agony, and in a violent fury threw the goblet on the floor. The whole affair was so ludicrous that the sick man burst into repeated peals of laughter, and the recovery of cheerfulness led to health.

**HONEY AS A FOOD.**—Many people are aware that honey, either simple or prepared in combination with other ingredients, is a desirable medical agent in certain cases, as in diseases of the throat, especially those of a mild nature, like hoarseness and a dry, inflamed condition; but not so many are aware that as a regular article of food it has a prophylactic and even a therapeutic value which can scarcely be over-estimated. Most sweets are to be taken with caution, as they are liable to impair the action of the stomach, or otherwise injuriously affect the system; but honey may at any time be eaten freely, according to the taste of the recipient, and will be found corrective and beneficial. In some cases, especially where the appetite has been pampered and demoralised by hurtful indulgence in unwholesome sweets or other foods, the taste for honey will need to be cultivated; but it will almost invariably grow with the restoration of the general physical tone, and become an individual characteristic.

## SPECIALITIES.

### DUNN'S FRUIT SALINE.

**WE** have received for investigation a sample of Dunn's Fruit Saline, and have submitted it to personal trial. The flavour is very pleasant, and the effervescing character of the preparation renders it especially agreeable. Its composition is that suggested by its title—namely, a combination of natural organic salts. The endosmotic action characteristic of such salines is usually painless, and the specimen under consideration is no exception to the rule. We have, therefore, much pleasure in recommending the Fruit Saline as an elegant, efficient, and even attractive preparation eminently suitable for the purpose for which it is intended.

Mrs. S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

"The Family Doctor contains a vast amount of really Practical Information."—*Reynolds.*

[SPECIAL ARTICLE.]

**DOMESTIC SURGERY.****USEFUL FOR THE HOUSEWIFE.**

Written and Illustrated by a SURGEON.

(See Frontispiece.)

**TRIANGULAR BANDAGE—(Continued).**

[N further illustration of this very valuable and simple bandage we give a series of diagrams which will explain for themselves the methods of applying.

Fig 24 shows a bandage used for injury to the hand—back, palm, or fingers—by placing the middle over the injury and crossing; then take a turn round the wrist and tie.

The foot bandage (Fig. 25) should start with the centre of the base under the instep and the point directed beyond the toes, over which it must then be folded. Then cross the ends and pass them round the ankle, returning to curve over the instep, and after a turn round, ends to be tied on top.

The shoulder bandage (Fig. 26) is placed with the centre of the base against the arm below the shoulder, and the point passing upwards towards the neck. When the sling is adjusted the point can be turned round it and pinned.

The bandage for the elbow (Fig. 27) is easily applied, and explains itself. May be fitted to any other part of the arm in the same way.

The knee bandage (Fig. 28) requires some little care in adjusting, or it will be inclined to slip down.

FIG. 29.—HIP AND WAIST BANDAGE.

In applying the hip and waist bandage (Fig. 29) the same process is observed as for the shoulder, the corner of the point passing under the waistband instead of the sling, and the ends, not usually being long enough to tie, are pinned separately. For keeping poultices and other dressings to the hip nothing could be better if carefully covered with this bandage.

(To be continued.)

If every man's internal care  
Were written on his brow,  
How many would our pity share,  
Who raise our envy now.

IMPORTANT DISCOVERIES OF GOLD are no doubt of great value to society, especially at a time like the present, when the money market is so tight and poverty so distressing. Still, however, there are some things in this world far more precious than gold, in spite of the immense influence it wields over mankind. Health, for instance, cannot be purchased for money, but it may be preserved and secured by the use of Holloway's Pills. No family should be without them, as they are equally good in their effects for either old or young. No complaint can for long withstand their healing power. They drive out all impurities from the blood, strengthen the digestive organs, and cleanse the stomach.

**REST.**

"LEAVE HURRY TO SLAVES."

By H. M. POOLE.

[N all the world there is no lovelier object than a healthy child who, after breakfast, plays with his toys for a while and then sinks into smiling slumber. Rosy, happy, winsome little cherub, whose rounded limbs grow in health and beauty day by day, your life is an example for children of a larger growth! For adults also ought to alternate between exercise and recreation, eating and sleeping. As for work, what is that except a serious recreation which calls into action one or more sets of faculties and the physical organs through which they operate? True, they are often over-exercised. Moderation is not the virtue of the nineteenth century. Men, and women too, often fail of high development simply through inertia. For we are so constituted that all portions of the frame and all faculties of the soul only maintain their equilibrium through alternate rest, recreation, and nutrition. To know how to secure their equipoise is to know the secret of health.

"That may be true in theory," a critic responds, "but what woman can govern her time? Life is the running of a race, in which every organ is strained to its utmost. They who lag behind lose everything. Woman, either as bread-winner or wife and mother, cannot stop to inquire whether she needs rest, or food, or sleep. She must simply keep on going as long as she lives. If she stops to take care of herself, she is a failure."

Only to a certain standard. The world spins dizzily down the grooves of time, and so its inhabitants suffer from nervous diseases, neuralgia, and heart-failure. But the exaggerated tendencies of the time will be understood; when they are, it will not take very long to overcome them; until then, if we cannot stem the current, we can at least refuse to be drawn into the thickest of the swim. It is necessary to be neither the hare nor the tortoise. Said Emerson, "Let us leave hurry to slaves." In fact, hurry implies slavery to the operating cause. In mind, as in matter, whatever is gained in celerity is lost in power. God is never cheated, though trying to do thirty hours' work in twenty-four is a foolish attempt.

In connection with physical habits it is well to consider the philosophy of rest, the very core of which is sleep. Everywhere there swings a law, like a mighty pendulum. "Polarity, or action and reaction," writes the philosopher, "we meet on all sides. . . . An inevitable dualism bisects nature so that each thing is a half and suggests another thing to make it whole—as spirit, matter; man, woman; subjective, objective; motion, rest. . . . Whenever the impulse exceeds, the rest or identity insinuates its compensations. After every foolish day we sleep off the fumes and furies of its hours."

All change is produced by the "vital force," the mysterious power which is known only by its effects. During waking hours it flows in a mighty, continual stream from its centre, the brain. The spinal column is its main channel, and through the nerves this vital force nourishes every atom of the human frame. Passing through the muscular system it is translated into action: passing through the brain it engenders thought. During the day we are either thinking or acting, or engaged in doing both.

Now comes in the "inevitable dualism." The pendulum can swing only so far before returning upon its path. Just the amount of nervous force which has been spent must, in compensation, be gathered from food and air. And it can only be collected during rest, recreation, and sleep. To keep the perfect balance, that which is exhausted during one day or week or month, must be replenished during another. Just so a reservoir is fed in the night time, when few demands are made upon it, only in one case the action is mechanical, in the other vital.

It follows that during sickness and after a period of exhaustion, rest is imperatively demanded. There are exceptions; the sickness

may be caused by indolence or by sedentary pursuits, or by over-exercise of only a part of the body. In either of these cases common sense teaches that rest has degenerated into stagnation. The sewing-woman suffers from over-rest of the trunk and limbs. On the other hand, the second-girl of a large city house, like the hard-working mother of a family, has need of just that kind of rest which is in excess in the former case. Grave diseases follow if either are long continued. To distinguish between the two, it is only necessary to observe if an invalid feels over-weary after a little exercise. If so, every motion is an indiscretion. Rest in an incumbent position, to her, and to the weary house-keeper, is the best of tonics. The spinal column, that main channel of vitality, is thus relieved of the strain put upon it in standing and walking.

If tired mothers only realised the recuperative power of horizontal rest they would so simplify work as to enable them to throw themselves upon a lounge from forty to sixty minutes every day. The dress should be loosened, the room darkened, care banished, and the mind withdrawn from external things into that sweet calmness which quiets the pulse and hushes into the region of ineffable peace. Then from its secret chambers the indwelling life breathes in that divine "oversoul," which envelops us like a finer atmosphere, and all the jarring wheels glide smoothly over their invisible pathways. Then the way-worn mother feels how sweet it is to have

"Round our restlessness His rest."

She rises from her couch with the throbbing pulse cooled down from the fever heat, refreshed through every fibre of her body, does Tom and Bessie run in from play with torn clothing and soiled faces, and perhaps angry and quarrelsome? In her repose she has gathered an equipoise which they intuitively feel. She has strength to deal with them justly and tenderly. And that she would have lost in keeping on at work, making cake for tea or embroidering a new dress for Bessie.

On the contrary, the sedentary person gets rest by a brisk walk. During several years I employed the same sewing-woman every spring and autumn—a stout, healthy, country-bred girl, who needed a good deal of exercise. After one o'clock lunch I used to urge her to walk about briskly for a while before going back to her room, but she always declined.

"No," said she, sadly; "women do not understand their own needs. I have tried to take exercise once or twice a day, but had to give it up. Most of my patrons thought I was cheating them out of their time. They forget I sit still till it seems as if my feet were paralysed. I could do more work and better after a run about the lawn, but they are jealous of the half-hour that would give me so much vigour. If I should exercise now it would only make me miss it more in other places where it would not be allowed."

The result is seen in the breaking down of that strong frame. She has not been able to work for many months, and her physician fears that she has consumption. To sit, year in and year out in a close, stuffy room, bent over her needle, is enough to kill the stoutest woman. In such cases rest means change of occupation.

Many times rest is the only medicine needed by the sick. If a dog is ailing he rolls himself into a ball in a warm corner and eats little or nothing till he is well. Quiet and warmth are the medicine of the four-footed philosopher. The biped loses the instinct of the animal; fumes, frets, takes stimulants and medicaments, and gives no chance to the recuperative forces of Nature. If he, too, would retire to his chamber, keep warm and eat next to nothing, those waste and poisonous matters which produced the disorder would be expelled, in due time, through the organs of secretion. That machinery which carries on involuntary motion when the body is at rest, pushes out of it from two to eight pounds of waste material in every twenty-four hours. The physician of experience says so. He also says that, with

"A GREAT COMFORT."—Yes, it is often misery for a person to cough and cough until it distress both himself and friends almost beyond endurance, but KEATING'S COUGH LOZENGES would stop all that; they are simply unrivalled; one alone affords relief. Sold everywhere in tins, 134d. each.—[ADVT.]

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—Daily Chronicle.

bathing and half-fasting, the system, in ordinary cases, will take care of itself.

That wonderful healing power which is only secondary to the creative power is to be respected and encouraged. If it be diverted into action it cannot be employed in self-cure. The injured shrub or tree heals itself. It is the force within the man which cures him; the doctor only superintends. After the late Franco-German War marvellous recoveries were told concerning soldiers who had been left to die after the carnage of a battle. There was inability to move during many days, and rigid, enforced fasting in the open air. The inherent vitality had nothing to do except to purify itself and repair gaping wounds. How successfully it was done thousands of veterans can testify.

Several years ago a schooner was shipwrecked in a great storm. During eight days the captain and four of his crew clung to the rigging, without having a mouthful of food or a drop of water. When rescued they were but just alive and had to be fed like infants. Before the storm the captain weighed twelve stone; after it, eight stone.

This example only goes to prove the waste going on in the system during rest and while fasting. When the system is "out of sorts," rest enables it to attain its normal equilibrium, which is health. After a time, if the machinery has not been diverted to other uses, the body is relieved of its load. It calls for more food, for vigorous exercise, and demands fuller expressions of life. Rest has had its legitimate use.

"What you write on this subject is all true," observes a friend at my side, as I read to her the foregoing; "but what can we busy house-keepers do about it? There are only so many hours in a day and there is just so much work to be done. Shall we neglect our households—pass lightly over our duties to husband and children?"

"Not at all," is my reply. "But the first justice of all is self-justice. You cannot do your duty in your family unless you are able to be, in the main, fresh, self-poised—a centre of power, a tower of strength. A weak, sickly, hysterical, nervous wife and mother is a pitiable object. Not only does she fail in physical stamina, but she fails in moral force. She is no longer capable of being the wise mentor, the friend, and companion of those she loves so well. She ceases to command respect; she attracts only their pity and sympathy; and pity and sympathy are insufficient to keep the family circle bright and happy, to say nothing of the wise guidance needed from their cradle by undeveloped children."

"I see but one way in which the wife and mother can retain her poise, and continue to meet the strain imposed on her by modern life. That way is to simplify the habits of the members of the household."

"In what respect?"

"In almost every respect. No rest is possible to her who is determined to keep up with all the multitudinous requirements of what is termed advanced or cultivated social life. You are acquainted with our neighbour, Mrs. Jones? No? I had forgotten that she has been an invalid ever since you came to town, and makes no new acquaintances. In fact, she is often confined within doors during months at a time. Well, Mrs. Jones is one of those victims to house-keeping who never had time to take a moment's rest. She has two daughters, her husband earns only a moderate income, and she determined to have everything in what she called 'style.' If she had company, the table must be spread with a profuse variety of dishes, the most of which she herself was forced to cook. I have been there to tea with three or four other guests, and the repast was one which should be only undertaken by an establishment having three or four domestics. It would be more than foolish even then. There were jellies and preserves of every variety, and no less than five kinds of cake. The supervision, if not the entire labour, fell upon her. Think of the mental, no less than the physical, strain to which she was subject!"

"Everything within her province was carried on in the same manner. Her standard of house-keeping is still so high that life is one long martyrdom. A little wholesome neglect of non-essentials, clothing more simply made for her daughters and herself, and fewer dishes,

and those simpler, for the table, and she would have had time to rest. As it is, she is lost to the girls just at the age when they most need a mother. After she broke down nervously from the need of rest, Mrs. Jones was confined to her room for many months. Things went by "sixes and sevens" below stairs, and when she was able to crawl down once more the miserable condition of kitchen and dining-room so affected her shattered nerves that she was thrown back into the same state of body and mind. And Mrs. Jones will never be a sound woman again. Let us simply live, then, and take needful rest."

## THE EYE.

### TO REMOVE SOLID PARTICLES FROM UNDER THE LIDS.

FROM the lower lid it is sufficient to pull the lid away from the eye, and to wipe the body with a piece of moist paper or the corner of a handkerchief; if it is under the upper lid, grasp the lid firmly between the thumb and finger, lift it from the eyeball, and draw it down over the lower lid, and then allow it to slide slowly back to its natural position. The foreign body will be scraped off on the lashes. The operation may be repeated several times. Or, lift the lid from the eyeball, allow the tears to accumulate beneath the lid, and forcibly blow the nose. Or, place in the eye a few grains of flaxseed, which forming a mucilage will probably bring relief. Or, place across the upper lid the point of a pencil or bodkin, and turn the lid back over it; in this way the foreign particle is brought into distinct view and can be readily wiped away.

Lime and Roman cement are very destructive to the eyes if permitted to remain any considerable time. Wash the eyes immediately with water, then with water containing vinegar or lemon juice.

For acids in the eye, wash with water containing a little ammonia or baking soda.

For alkalis, wash with water containing vinegar or lemon juice.

## THE FINGER NAILS.

A FASHIONABLE manicure declares that finger nails grow more rapidly in children than in adults, and that both in childhood and age they grow faster in summer than in winter. In one instance a nail that required 132 days to renew in winter, renewed in summer in exactly 116 days. During both seasons the patient upon whom this experiment was made enjoyed normal health. The method of testing this growth was in each instance the same. The nail was pared close and slightly notched at the quick. Both the right and the left hand were studied, with the result that he affirms that the growth of the finger nails is more rapid on the right hand than on the left. As the person was right-handed it is presumed that the contrary is true of left-handed individuals.

One peculiarity of the growth of finger nails in addition to those stated is that the period of renewal differs proportionately with the length of the fingers. Thus it is more rapid in the middle fingers than any other. In the fingers on either side the middle finger the period of renewal is about equal and slower. It is even more slow in the little finger, and slowest of all in the thumb. Comparing the same fingers of the different hands, the person who discovered these curious phases of growth states that on an average the nails on the left-hand fingers of a right-handed person requires eighty-two days longer to renew than those of the left hand. In one particular the growth of the nails and hair and beard are governed by the same law, that of growing more rapidly in summer than in winter.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 9d., and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 3s or 13s stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

## THE PURE AND NATURAL MAN.

### AN EXPERIMENT IN WHOLESOME LIVING.

OF all unreasonable people, your logical man is the most extravagant. My friend the Logician—he is an altogether different person from Bob Logic, of immortal fame—is a case in point. He began life with a profound distrust of the common sense of humanity, and early constituted his mind a kind of Lydian stone for all mortal customs and observances. Consequently he is a faddist of the most encyclopædic kind—a veritable museum of fads. For some inexplicable cause, he simply will not take the world as it is. "We are in a period of transition," is one of the foolish sayings he has acquired. Just as though the world had not always been, and will not always be, in a state of transition from yesterday to to-morrow. And "We lead such artificial lives," is another.

There is always some great movement on which is presently to end the transition stage and inaugurate an epoch. Sometimes he is going to advance humanity by means of all-wool garments, and sometimes by putting Mrs. Logician in trousers, and wearing petticoats himself. Sometimes it is by legislating against children eating buns, and sometimes by a ladies' league against kissing. Possibly it makes him more entertaining than he would otherwise be.

However, the attitude he has recently assumed with regard to soap and water is, socially speaking, unfortunate for him. He seems to have at last definitely devoted himself to offensive martyrdom—the fashionable martyrdom of the age. He has held his new opinions now for, perhaps, a couple of months, so that as yet he is not so completely isolated as he must ultimately become. As yet, his personal appearance, though uninviting, is not altogether prohibitive of intercourse, and his hesitation to rigorously carry out his theorem, so far as it effects his clothing, has been decidedly in his favour.

But already he begins to savour a little of the Oriental saint, and an olfactory nimbus will presently fend him off with growing completeness from common unreasonable men. We shout our arguments now in brief snatches of interview, standing, as it were, on the shore of the corrupt, and watching him recede from us, whither we cannot follow, upon a voyage to health, longevity, and purity; for it is at these things that he aims in his singular way. While an exchange of thought is still, in a broken manner, possible, and with the memory of former discussions fresh in our mind, we may, perhaps, set down here the ground he stands upon, and the line of investigation that he has followed thus far.

For private reasons, into which we have never pried, the Logician sets great store upon the duration of his life and the efficiency of his interior economy. To a large extent, we believe this tendency was inherited from, and further in early life fostered by, the Logician's widowed mother. We remember while at school the Logician evinced a most singular care of the food he consumed and the clothing he wore. He would reject green apples as not being "good" for him—as though anything could be evil or unwholesome for a healthy boy; and he would change his boots if his feet got wet; and cheerfully and even eagerly take physic, and do many like things unnatural and even abominable to the youthful mind. And his favourite reading was among books of physiology and medical pamphlets and advertisements; and concerning ventilation and food, and of all that might inwardly corrupt or establish him; and of the dangers of draught and damp and bacillus, that beleaguered his poor body without. And he would sit on a fence in the shade and meditate on sunstroke, and on his private symptoms, while we played cricket in the hot sun. Such was the Logician as a boy, and the boy was father to the man.

He early became sceptical of the science of the common medical man, and followed after strange physicians. He had—and who has not in these days of mental and moral unrest?—his

SATISFACTION GUARANTEED. Health, comfort, economy CORSETS made to order wear best. Distance no hindrance. Measurement-forms free. Every kind, lowest prices, best qualities, made quickly by FORD & PARR, Corset Factory, 141, Stockwell road, London, S.W. Estb. 1859. Try one. Please call or write.

period of doubt and denial. Was oatmeal porridge exceptionally nutritious, or did it irritate the coatings of the stomach? at one time agitated his mind; and, again, Should one drink during, or immediately before, or some time after, a meal? Then, Is white pepper a poison?

Endless questions like these rose up and were grappled with external authority and common usage not helpful, vague, or even conflicting; but he struggled on towards conclusions that he felt were true. Alcohol he was so happy as never to have tasted. A great crisis of his life was, of course, his decision on the question of animal food. A perverse propounder of paradoxes had afflicted him for some time with the suggestion that the diet most easily assimilated and most nutritious must of necessity be that which resembled his own substance most nearly, and abruptly urged him to a private practice of cannibalism. "Start an orphanage, a home for waifs and strays," said this Mephistopheles, "and say they are gone to Canada"; but the Logician, recoiling from these temptations in horror, took refuge in the position of a moderate vegetarian. He lived largely for a considerable time on (boiled) milk from his own cow, stewed greengages, and rice, and it was while subsisting on these stimulating things that his mind evolved the great theory of the pure and natural man.

Directly he propounded this he saw that he had struck the clue to his life's problem. Slowly and steadily, while in a search after single isolated hygienic truths, he had worked his way to the *one* hygienic truth, the underlying principal of all healthy living. Briefly, the view was this: The essence of all civilised ills, is the fact that man is leading an entirely artificial life; all around him is concocted, unnatural, and impure. The Logician put it in this way: "He drinks fermented and similarly vitiated fluids; he not only slays, but preserves, pickles, and drugs his food; he toils into the middle of the night, and sleeps into the heat of the day, and he whets his appetite with condiments. Nature rebels against these things, and then he seeks refuge in adulterations. He takes wilfully adulterated food—bread deceitfully whitened, for instance—and he seeks adulterated sleep in narcotics. No wonder his teeth decay; no wonder his nerves are unsteady; no wonder he is early bald, and always melancholy!" The scales fell from the Logician's eyes. Man must return to Nature, whose law he has despised.

And so the Logician resolved to bring back the long, healthy days of Methuselah, by reverting again to the natural life. "To rise with the sun, and sleep at sunset; to consume, unspoilt by cookery, the spontaneous fruits of the earth; and to sleep on the ground in a shed open to the air," were the first results of this discovery. The weather was hot when he began, and we were almost tempted then to follow his example.

The Logician was zealous and active to defend his thesis. Sitting in his shed, he gathered support from temperance tracts and Herbert Spencer, from physiological text-books, travellers' tales, and books of sermons. He talked of the healthy and largely vegetarian negro, and of the beauty and strength of the South Sea Islanders in their unsophisticated days. Then he would denounce our diet, in biblical phrase, as carnal and impure. Then, deftly turning to Herbert Spencer's "Data of Ethics," he would explain that man, through his rapid civilisation, was living in a new and strange "environment," to which he was imperfectly adapted. His true sphere yet, in spite of the virus of cities, was under the open sky. "Come out of your pantry catacombs," cried the Logician; "come out of your stifling houses; crawl out of those husks of dead beasts (your clothes), and be pure and natural men once more!"

But at first the Logician washed much with soap and water throughout the day. The paradoxical friend it was who led him beyond that. He put his finger with silent questioning upon soap, and the Logician, confounded for a moment, bowed himself to the unavoidable. The life to which man is naturally adjusted, he perceived, could certainly have no soap in it. "It is a compound of alkalies and fatty acids, devised in cities, and boiled in sweating factories beside polluted rivers. It can mean

only evil to the finely-adjusted organisation of men. The fine-built negro, the interesting Indian, the smiling, white-toothed gipsy know it not."

"Moreover, the skin of the civilised man is unnaturally clean, cruelly exposed to any change in the temperature of the air, its cuticle abnormally thinned by potash." The Logician turned the matter over and over again, and the thing seemed true; he felt it *was* true.

Going further with the impetus of the idea, "Is it natural," he asked, "to wash at all? Possibly it is in South Sea Islands, but is it in this temperate clime? Did our bare-sark fathers wash? Do the Esquimaux?" It was a new line for the Logician, but he held to it sternly.

Suddenly he perceived the reason for all the coughs, colds, and consumptions that afflict us—we are without our "natural covering." He sighed, for he had regarded cleanliness as next to godliness, and went and flung his soap out of the shed.

And thus it came about that he severed himself from us, and is now living apart. He may or may not be right, like anybody else in this liberal age, but he is certainly getting very unpleasant. He holds now that washing has led to clothing, as one crime leads to another; man stealing the skins of dead beasts, and fluff from seeds, and the bark from plants to make up for the "natural covering" he removes from himself. The Logician anticipates that now, very shortly, he will be able to do without his present hygienic all-wool habiliments altogether—his own natural crust being restored; but this, we anticipate, will bring him into conflict with the vulgar in his village who are already greatly exercised about him, and so lead to a crisis in his mission.

And really he is so reasonable, too. Anyone can say "rubbish"; but not everybody will be able to assail with success this position of his. Is soap a wholesome thing? At any rate, is it natural? It is certainly alkali—the very name is horrible—combined with animal fat. A Kaffir would be as contemptuous as you are, dear reader, if you assailed his custom of smearing himself with unpleasant compounds. We must confess that we still adhere to the new practice of washing, but we certainly fail to see where the Logician is wrong. His views are placed before the reader in the hope that here and there some poor soul, tiring of teetotalism and vegetarianism, and sighing for some virtuous novelty a long the same line, may find a use for his idea, and gain, by abstinence from soap and clothes, a pleasurable sense of superiority over the indulgence, weakness, superstition, and stupidity of common men.—*Pall Mall Gazette*.

MEN who have lived in crowded, pent-up streets, through whole lives of toil, and never wished for change; men to whom custom has indeed been second nature, and have come almost to love each brick and stone that formed the narrow boundaries of their daily walks—even they, with the hand of Death upon them, have been known to yearn at last for one short glimpse of Nature's face, and, carried far from the scenes of their old pains and pleasures, have seemed to pass at once into a new state of being, and, crawling forth from day to day to some green, sunny spot, have had such memories awakened up within them by the mere sight of sky, and hill, and plain, and glistening water, that a foretaste of Heaven itself has soothed their quick decline, and they have sunk into their tombs as peacefully as the sun, whose setting they watched from their lonely chamber window but a few hours before, faded from their dim and feeble sight! The memories which peaceful country scenes call up are not of this world, or of its thoughts and hopes. Their gentle influences may teach us to weave fresh garlands for the graves of those we loved, may purify our thoughts, and bear down before it old enmity and hatred; but beneath all this there lingers, in the least reflective mind, a vague and half-formed consciousness of having held such feelings long before in some remote and distant time, which calls up solemn thoughts of distant times to come, and bends down pride and worldliness beneath it.—*Charles Dickens*.

## THE SLEEP OF DEATH.

Two hands upon the breast, and labour is past.

—Russian Proverb.

A MUTE despair, from thought of dying throes,  
Broods o'er the heart at times; a phraseless fear

Of griding pangs englooms that rayless mere  
'Tween life and breathless stillness and repose.

For most, the fear of dying, not of death,  
Enthralls. But calm as crestless seas, sun-smoothed

From storm that grooves the deep, so calm and soothed,  
So face-composed seem they of vanished breath.

The dead as restful lie as though sweet sleep  
Had smoothed their pillows for a dreamless night,

And sealed their fallen eyelids softly tight,  
Then bade the voiceless silence vigil keep

Till new day reign. Nay, life that once is here  
Lives on for ever. There exists no law  
Of waste and void to veil the soul's clear awe  
Of all that lies beyond the pall and bier.

For love denies that life hath end for those  
Whose tired hearts have sunk with weariness  
To sleep—a rest as safe as in caress  
Of parent's arms is infant's hushed repose.

As night's thick darkness soothes to stillest rest

The day-worn labourer, till blush of skies  
Steals soft and slow upon his veiled eyes,  
And wakes him to the dawn refreshed and blest,

So hath the soul it raptures still and deep,  
Nor fears life's sunset verge, nor earth's good-night.

Though darkness falls without, within there's light  
From Him who giveth His beloved sleep.

When heaviest sobs the heart, the soul doth glow  
All luminous with God. Yon star-robed skies

On blackest nights bend nearest human eyes,  
And fairest shine when darkness reigns below.

Though all at last with sovereign death must trace

His passage-ways which slope to nether gloom,  
Yet faith, as Christ's, unbars their rayless tomb

And robes them with His resurrection face.

Then sweep your earth-worn hearts and make them clean

Of smileless memories of shroud and knell;  
For from the starry fane the vesper bell  
But rings thee rest within its aisles unseen.

—PHILIPS.

WHEN the great Father, in His everlasting watch, paces His daily and nightly rounds, and through these lower mansions of His gathers in the offered desires of His children, *where*, think you, does He hear the tones of deepest love, and see on the uplifted face the light of the most heartfelt gratitude? Not where His gifts are most profuse, but where they seem most meagre. Not where the suppliant's worship glides from the cushion of luxury, through lips satiated with plenty and rounded by health. Not within the halls of successful ambition, or even the dwellings of unbroken domestic peace; but where the outcast, flying from the persecution, kneels in the evening upon the rock whereon he sleeps; at the fresh grave where, as the earth is opened, heaven, in answer, opens too; by the pillow of the wasted sufferer, where the sunken eye, denied sleep, converses with a silent star, and the hollow voice enumerates in low prayer the scanty list of comforts, and shortened tale of hopes. Genial, almost to miracle, is the soil of sorrow; wherein the smallest seed of love, timely falling, becometh a tree, in whose foliage the birds of blessed song lodge, and sing unceasingly.—*James Martineau*.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

### NOURISHING SOUP FOR INVALIDS.—

Time, two hours. Two pounds of lean veal or beef with a quarter of a pound of pearl barley in a quart of water, boil very slowly until it becomes the consistency of good cream, flavour it with a little fresh celery, or celery seed, and salt. Strain it when done through a fine hair sieve and serve. This soup will not keep till the next day, therefore not more than the quantity required must be made.

**BOILING-WATER SCONES.**—Half-pint of cold water, one ounce fresh butter, half teaspoonful of salt, one teaspoonful of brown sugar, enough fine flour to make a thick paste, then put on the fire, and stir till it boils. Let it boil a few minutes till it is as thick as a roly-poly pudding, stirring it all the time, and turn it out on the board. Cut the lump into four pieces, and roll out one very thin, and cut it into shapes; do the same to the others, then put them into the frying-pan without suet, just as the "coarse flour scones," and leave them till the under side is a little browned, then turn them, and when the other side is a little baked put them on a plate one above another.

**FLOUR SCONES.**—One pound of fine flour, one teaspoonful of carbonate of soda, half teaspoonful of salt, one teaspoonful of brown sugar, one tablespoonful of vinegar, mixed with a breakfastcupful of milk to make a substitute for buttermilk. (If buttermilk can be got the vinegar is not required.) Mix all together in a bowl with a wooden spoon. Then roll it out on a board, cut it into shapes, and bake them in a large clean frying-pan (fire not too strong) for about four minutes.

**CREAMED OYSTERS.**—Heat one pint of cream in a double boiler, with a little mace and slice of onion. Heat one quart of oysters, skim liquor and take from stove, removing oysters. Mix one tablespoonful of flour with one-third of a cupful of milk, and when cream is hot, add to the liquor, and that to the cream. Cook eight minutes; strain, add oysters and seasoning. Serve with toasted crackers.

**BREADED TROUT.**—Roll in crumbs, dip in egg, again in crumbs, and fry in deep lard. Lay on brown paper, to absorb any grease, and serve with sliced lemon.

**BROWN STEW OF HEART.**—Brown one sliced onion in butter, dredge with flour, stir smooth, add one pint of hot water, then sliced heart, one sliced carrot, salt and pepper. Simmer till done. Remove heart, thicken gravy, if required, strain and serve.

**CALF'S HEAD AND TOMATO.**—Brown one tablespoonful of braided flour, add one cupful of pot liquor, one cupful of tomato (juice strained), and meat from boiled calf's head. Season, simmer five minutes and serve.

**TRIPE AND OYSTERS.**—Cut tripe small and boil ten minutes. Add one small tablespoonful of braided flour, pepper and salt. When it boils up again add twelve oysters.

**PIGEON STEW.**—Simmer jointed fowls till tender. Add one teaspoonful of braided flour, pepper and salt, and boil up; add one-half cupful of cream and serve.

**ROAST TONGUE.**—Sprinkle salt, pepper, and one teaspoonful of ginger over the tongue, and stick in four cloves. Cover with thin slices of bacon, and bake. Squeeze one-half of a lemon into the pan ten minutes before serving. Simmer to one-third, and serve gravy separate.

**CHICKEN A LA ROYALE.**—Season and roll boiled chicken in flour, and brown in butter. Serve with sauce of two tablespoonfuls of braided flour, three cupfuls of chicken stock, one-half bay leaf, one teaspoonful each, celery, salt, and chopped parsley. Boil twenty minutes, strain, and add eight chopped mushrooms. Cook ten minutes. Add the yolks of two raw eggs and the juice of one-half of a lemon.

**BIRDS AND OYSTERS.**—Cover small birds in pan and roast, basting often with a little water and butter. Roll one large oyster in melted butter, and put inside each bird.

**RABBIT STEW.**—Joint rabbits, fry in hot bacon fat with one sliced onion. Cover with one quart of boiling water, add one sweet pepper (cut small), three cloves, salt and pepper. Simmer till meat is tender, add one tablespoonful of braided flour, and parsley.

**RABBIT PIE.**—Cut in pieces; brown in hot pork; add chopped young onions and mushrooms, and fry five minutes. Sprinkle with one tablespoonful of flour; mix well, moisten with one glassful of white wine, one pint of stock, add salt, pepper, nutmeg, and simmer one-half hour. Add parsley and take from fire. Line a dish with paste, put in a layer of rabbit and pork—strained from stock. Strew with sliced, hard-boiled eggs. Continue layers till the dish is nearly full, pour gravy over, cover with paste and bake.

**GAME PIE.** (Best made of two or three kinds of game).—Put the trimmings, giblets, &c., on the fire in one and a half pints of water. Stew one hour. Line a dish with paste. Lay in the birds—jointed and covered with tiny strips of pork. Season well. Make forcemeat of a little minced pork, stewed livers, herbs, and crumbs, moistened with broth. Strew this on each layer, add one glassful of wine to strained gravy, and pour over the birds. Cover with crust and bake slowly.

## HINTS FOR THE HOUSEHOLD.

IT IS WELL TO REMEMBER that flannels should always be washed by themselves in a suds prepared for them; on no account be rubbed on the board unless very dirty. That the suds should be pleasantly warm to the hands, not too hot, and no hot or cold water be added while the flannels are in the tub. That they should be rinsed in clean water of the same temperature as the washing suds, and as many waters used as may be necessary to take all the soap out, as the flannels will never be soft with the soap left in them. That they should never be blued. That they should be pulled in shape before hanging; undershirts being hung from the shoulders. That they should never be hung out of doors in freezing weather, but quickly dried before the fire, or, better, over the register, and pressed as soon as dry enough. That black woollen and cotton hose should be washed by themselves (so as not to get lint on them), pulled in shape, hung on the line from the toes, as then the drip will go down, instead of remaining in the toes and shrinking them.

In drawing-room furniture white and gold are the favourite combination of the day.

WHEN the kernels of walnuts have become too dry, let them stand in milk and water over night. They will then be as fresh as when new.

A LUMP of sugar saturated with vinegar will cure hiccoughs.

A LITTLE paraffin rubbed on screws will make them enter wood more easily.

FLAT-IRONS should be kept as far as possible removed from the steam of cooking, as this causes them to rust.

DRY the leaves and left-over stalks of celery, and keep them in a self-sealing glass fruit jar, to flavour soups with.

DON'T throw away a lamp-wick as soon as it is short, but wash it, baste a strip of white muslin to the lower end, and use it a week or two longer.

If hard soap is taken from its wrappings and stood edgewise on a shelf in a warm room, or put in a bag and hung behind the kitchen range for a few weeks, it will last decidedly longer than otherwise.

TO CLEAN BOTTLES.—Unclean bottles litter cupboards and shelves so hopelessly that we have

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 14d. and 2s. 6d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, E. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

learned to make a yearly collection of same, commencing usually with the house cleaning. We have a big box in the pantry, placed there especially for receiving this collection of sticky, greasy, gummed glassware, and whenever, during our house-cleaning raids or between them, we run afoul empty, uncleaned bottles, or bottles with contents spoiled and so useless, or bottles of unlabelled, forgotten medicines and so worse than useless, we empty all such vials that only lumber the shelves and invite possibilities of delay and danger, and consign them to this box of dirty bottles. It fills fast, and why should it not, with every mantle and closet and bureau and shelf contributing its share? When house cleaning is finished, and we are positive every unclean vial has been dumped with this collection, we fill our boiler with cold water, add a generous pint of soft soap, and immerse the bottles in it, gradually bringing the water to a boil. The lye cleanses the vials perfectly, eating away grime and grease and poisonous sediments and sticky gums that may smear the bottles. When boiled free of impurities, we rinse each vial till it shines clear as crystal, then drain in pans and stow away in the back pantry on the "clean bottle shelf," in readiness for the many demands made upon it.

## TWO MAGIC SQUARES.

CONSTRUCTED BY A GERMAN MATHEMATICIAN OF THE LAST CENTURY.

HERE are two magic squares that show some interesting features. They were constructed by Euler, in 1759:

23	18	11	6	25
10	5	24	17	12
19	22	13	4	7
14	9	2	21	16
1	20	15	8	3

In this square we begin with 1 in the lower left-hand corner. The other numbers are placed just as a knight would move on a chess-board—viz.: two squares one way and one the other. The last number, 25, comes in the opposite, or upper right-hand corner. Another curious feature of this square is the fact that the sum of any two numbers on opposite sides and equi-distant from the centre figure, is its double. The middle number is 13; 23 and 3 equals 26, twice 13; 5 and 21 equals 26, twice 13; 19 and 7 equals 26; 22 and 4 equals 26, and so on.

30	21	6	15	28	19
7	16	29	20	5	14
22	31	8	35	18	27
9	36	17	26	13	4
32	23	2	11	34	25
1	10	33	24	3	12

In the above even square the figures are again placed as a knight moves, and the knight returns to its starting point in a square of six. In this square the difference between the pairs of numbers opposite to and equi-distant from the middle point is always 18. The sum of the numbers in all the rows, vertically, horizontally, and diagonally, is 101; 1 and 19 are equi-distant from the centre point of the square, and their difference is 18; 30 and 12 are equi-distant, difference 18; 21 and 3, 29 and 11, &c., are equi-distant from the centre point on opposite sides, and their difference is 18 every time.

BIRDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

# THE MOTHER'S PAGE.

## MOTHERS SHOULD KNOW SOMETHING OF THE RULES OF HEALTH.

"If I had only known a few of the facts about simple medical practice," said a young mother, "I might have saved myself months of suffering, and an enormous doctor's bill. But I was brought up to think that girls should not know about such things, and to send for the doctor whenever anything happened. Indeed, the stereotyped phrase: 'Send for the doctor at once,' is tacked on to all directions and advice of all sorts wherever one may find it. I see no necessity whatever for this everlasting racing after a physician, when a little common-sense on the part of the mother of the family would set everything right, and save money and misery, as well as time and trouble. I think every woman should have, at least, a limited course in simple medicine and surgery. Any girl who is old enough to marry and assume the duties and responsibilities of that relation is old enough to understand the fundamental rules of health, and should be expected to know what to do in ordinary emergencies. Instead of this, the idea is carried that she must under all circumstances call in a doctor and follow his advice, with a goodly bill to pay afterward. Of course, doctors have to live, and it is only natural that they should discourage household medication. All the same, there ought to be a young mothers' school of medication, in which physiology, hygiene, and the symptoms of the more ordinary diseases could be so explained and demonstrated, that the woman would know what to do in case of sudden illness or accident. It is not reasonable to say that such knowledge would in any way prove disastrous. The more familiar one becomes with disease and its indications the more readily one can form an idea of the necessities of the case. No rational person would, of course, advocate neglecting those who are sick. In most cases, neglect comes from ignorance of the fact that medical assistance is required. Someone is ailing, but in the absence of clearly defined knowledge of the requirements of the situation the disease is allowed to run on until it assumes some serious phase. If the father or mother understood enough of existing conditions to realise there was danger ahead, many lives might be saved by the timely application of suitable remedies. It is therefore urged, and with great show of reason, that very much more attention to everyday medical study be given. Any person of average intelligence can readily master the primary rules of the profession, and can educate the eye and perceptions to such an extent, that the symptoms of disease may be detected at once.

"Having gone that far, practical every-day observations will supplement the knowledge already acquired, and enable the parents to understand when the necessity of calling in medical counsel exists. It is often the case that for lack of this knowledge, disease gets such a hold on the patient that all the skill of the best practitioner is powerless to combat it."

## FOOD AND CLOTHING.

It takes both to keep us warm. In tropical climates clothing is not necessary, food is sufficient; but in this climate, where the temperature may go down to 80 deg. below the body temperature, and where the average temperature is nearly 30 deg. below the body temperature, clothing is a necessary condition of life. In the colder weather the clothing should not only be thicker, but should fit more closely.

On ordinary occasions it should be loose enough to allow free circulation of the air to carry off the moisture; but if one is going out in a cold, high wind, one should have the openings in the clothing, especially around the wrist and neck, securely covered, in order to

prevent the too rapid circulation of air. This is the sum and substance of rules for clothing.

As to materials, they will vary according to the season, &c. Loose woollen is the warmest goods; it has air spaces in its fluffy texture, and the air is the best non-conductor of heat that we have. However, there is another side to the question of material for clothing, and that is keeping it clean.

Not only is water constantly given off by the body, but the surface is constantly shedding scales, as an animal sheds its hair; and this material is organic matter and dead material, which is no longer of any use to us. And not only that, but is a positive danger under certain conditions, so that whatever clothing comes in contact with our body should be frequently washed and should be capable of being washed without injury.

## A WORD TO MOTHERS.

Do not always be a drudge in your own household. Rest a little whenever you can, and allow the younger members of your family to do some of the work. Have a chair by the fire, and when you peep into the oven sit while you look, yea even a moment after; you will work all the faster for the short change of posture. While mending have your chair in the cosiest corner, where good light will come in, and let the sun strike upon you, if possible, so that you may get the strengthening, health-giving influence of it. Drop your hands occasionally, and let them rest. Let your eyes wander out through the window-glass as far as possible, and rest your eyes by looking at something interesting out of doors. Drop the reins of household government for a little while, unbend yourself, and sit down on the rug and play with the children, and, as it were, become again a child. Economise your strength. Sit when you can. Do not hold the baby when it can rest, and grow just as well in its crib. By resting when you can, by planning the work to be done, and by being systematic and orderly in all things, a woman's work at home is more easily done.

## WHEN MY WEE BAIRNIE'S A MAN.

I SIT i' the gathering shadows,  
Wi' my bairnie close clasped to my breast:  
He's capered a' day like the lambkins,  
An' now my sma' laddie must rest.  
An' I sit i' the little, low rocker,  
An' hush 'im to sleep, an' I plan  
O' a' the great comfort he'll bring me,  
When my wee bairnie's a man.

We'll dwell i' a snug, cosy cottage,  
Wi' the ivy vines clamb'rin' about,  
An' the sweetest an' freshest o' posies  
Abloomin' within an' without;  
An' the birds will come chirpin' an' fluttrin',  
An' chatterin' gay as they can,  
To make their soft nests i' the roses,  
When my wee bairnie's a man.

An' a' the dear, bonny bairnies  
From over the green, grassy lea  
Will love to stop at our cottage,  
An' talk to my bairnie an' me.  
Their bright, little innocent faces,  
That I an' my darlin' will scan,  
Will cheer us, an' we'll be so happy,  
When my wee bairnie's a man!

Fair, little, slumb'rin' laddie,  
You're a' the wide country to me,  
An' a kiss from your lip red as roses  
Is sweeter than honey can be.  
Sleep sweet, my dear, little bonny,  
An' grow just as fast as you can,  
For O, a' the world 'ill be joyous,  
When my wee bairnie's a man!

## HOW TO BREAK UP BABY'S COLD.

WHEN I find baby has taken cold, says Clarissa Potter, not so feverish and sick as to require packing, which one dreads to do because of the increased danger resulting from any exposure afterward, but a smart cold in its first stages, with red eyes and running nose, and stuffed

head, I take the little one in my lap several times through the day, and again at bedtime, and, removing boots and stockings, rub the little feet—soles and tops and ankles—with sweet oil, or goose oil, and then heat them long and well before an open fire till the skin will absorb no more oil.

Then I bathe and rub the little bared back from neck to hips, especially along the spine, with oil also; shielding baby's back from cold drafts, and letting the warm rays of fire light and heat it just right, chafing and thoroughly heating till skin will absorb no more oil.

Wrapped in flannel and tucked away in her warm nest for the night, baby often wakes in the morning with but little trace of her cold.

If there is hoarseness in connection with other symptoms of an oncoming cold, for a simple remedy, I like to give baby a few teaspoonfuls of onion syrup made of sliced onions and brown sugar, which helps to soothe the throat and clear the bowels, carrying away, perhaps, the aggravating source of the cold.

## BATH ROOMS.

IN my lady's bath room the furnishing is an important factor, and in new dwellings these rooms are artistically equipped. They are of good size, the walls are painted in a shade of delicate French grey, or in some place they are papered to resemble tiles; either is acceptable. They generally have one window of ordinary size, which is dressed by a white or linen shade. There is a stationary basin, with small closets underneath. The marble bowl is of good proportions, while it adds greatly to the effect if the faucets are nickel plated.

The variety of toilet articles offered by shops and stores is great; soap jars, cups, and toothbrush-holders can be purchased at a reasonable price. As for towels, the bath room should have a bountiful supply. The Turkish-bath towel is an indispensable adjunct, and in homes where taste is exercised the elegant towels of the day have prominent place. Towels with borders of different colours can be bought at extremely low prices. Monograms are in vogue, and the letters can be embroidered in different shades of silk. The price is high, while the drawn-work can be done at home as fancy dictates. The good huckabuck is always sought after, and there is always endless variety in towels.

All the plumbing arrangements of the bath room should be carefully perfected, and the traps should be continually watched, as sewer gas is an exceedingly fruitful source of disease. The utmost cleanliness should be preserved, and this apartment of all others on cleaning day should not be neglected. There should be ventilating shafts and everything provided to ensure a healthful condition.

A good oilcloth will make a suitable floor covering, as it will not be injured by water from the tubs. A large sponge should be fastened by a hook near the tub, on the wood-work above, and should be carefully dried after being used.

In many houses, where room is limited, the hamper for soiled clothes has a place in this room. A good-sized bracket is desirable in every bath room. One of the three-cornered kind is best. On it can rest the lavender water, bay rum, vaseline, tooth powder or any of those toilet accessories which are called for in connection with the bath.

Before the bath-tub a carpet-mat should be spread, which is more agreeable to the feet than oilcloth. The brasswork should be cleaned weekly, and care taken to keep everything neat and tidy.

In severe weather, when the thermometer runs low, the water from the faucets in the tub should be left running over night, in a small stream, to prevent the pipes from bursting and playing havoc with the ceiling below.

STEEDMAN'S Soothing Powders for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Waltham, Surrey. Sold everywhere. *See the EE in Steedman.*

TO TOBACCONISTS (commencing).—Illustr. Guide, 2-9 pages, "Post Free." How to Commence. £20 to £1000. Tobacco's Outfitting Co., 186, Euston Rd., London. Manager, Hy. Myers. Est. 1866. Smoke "Pick-Me-Up Cigarettes."

[SPECIAL ARTICLE.]

## IS LIFE WORTH LIVING?

A REPLY TO SIR EDWIN ARNOLD.

By "H., M.D."

THE oft-repeated question, "Is life worth living," has been put and answered by no less an authority than Sir E. Arnold, and this is what, according to the *Times* report, he is stated to have told the members and students at the inaugural meeting of the Midland Institute, on October 10th:—

"If they would have the patience to listen, he would have the courage to speak, and his address should be upon some aspects of human life, free, of course, from all theology and politics. I fear," he went on, "that I must alienate certain friendly minds, and appear to commence by presumption when I say that I return to Birmingham just as convinced of what can never be proved as when I left it. *I have found life in the highest degree charming and interesting, and this, notwithstanding an ample share of what are styled, sometimes, I think, a little too querulously, its 'pains and sorrows.'* I quitted Birmingham in the pleasant beginning of my days, glad to live; I come back to it, after much experience and many labours, glad to have lived—well satisfied with my share in the world, and a resolute philosophical opponent of those who love dismal dialectics, and drape the universe in the black hangings of pessimism."

The italics are mine. Sir Edwin added, "Look at common modern existence as we see it, and note to what rich elaboration and large degrees of comfort it has come. I leave aside for the moment uncivilised nations, and the bygone struggles of our race. I invite you briefly to contemplate an artisan's existence in your own Birmingham. Let alone the greatness of being an Englishman, and the safety and liberty of his daily life, what king of old records ever fared so royally? What magician of fairy tales ever owned so many slaves to bring him treasures and pleasures at a wish? Observe his dinner board. He can fare at home as no Heliogabalus or Lucullus ever fared, and then, for a trifle, his daily newspaper puts at his command information from the whole globe. At work, machinery of wonderful invention redeems his toil from servitude, and elevates it to an art. Is he fond of reading? There are free libraries open to him, full of intellectual and imaginative wealth. Is he artistic? Galleries rich with beautiful paintings and statues are prepared for him. Has he children? They can be excellently educated for next to nothing. Let fancy fill up the imperfect picture with those thousand helps and adornments that civilisation has brought even to lowly lives; and does it not seem stupid and ungrateful to say—as some go about saying—that such an existence, even if it were transitory, is not for itself distinctly worth possessing? But will it last?"

We will dismiss the last question, "Will it last," by the note that *the present* concerns unhappy living mortals most.

No question can be of greater interest to human beings whose lot it is to bear some infirmity of the flesh, whose skeleton in the cupboard is that he or she or some loved one is afflicted, and I take it that the majority of my readers, especially those who seek the skilled free advice columns of this periodical, are so situated, that the question comes home with peculiar directness. Sir Edwin Arnold has resided a great part of his life in the East, and has returned home to find himself at the highest pinnacle of fame, and although, perhaps, they are known to few, we will grant him a fair share of the troubles and tribulations of life, yet the fact remains that he is now an eminently successful man, and he can afford to look on the world at large through rose-tinted spectacles, yet we shudder to think what would have been his answer that the "crosses" he may have had to bear bore him down, say, to a sick bed, and the finger of fortune held aloof. Yet such is the lot of numbers in our midst, to whom the wonders of our civilisation is an empty boast.

The woman in child-birth labours and groans, but the pain is soon forgotten in the joy at seeing her first born, but if from some anatomical defect, the labour is prolonged beyond due time, and human skill gives no relief before exhausted nature gives up the unequal struggle, small comfort to the sorrowing husband to hear the doctor proclaim that the death was caused by the effects of civilisation. Purchased at such a price we had better undergo a process of involution if the magical word evolution means in the result the destruction of a human being by an agonising death.

If it be true that the present miner's strike is brought about by the effects of competition amongst coal owners, who themselves declare it to be inevitable, and that they cannot go on and pay a fair wage upon which the miner can support life, which he, in his turn, avers is all he is seeking, then our civilisation must indeed be a success (?).

And these advantages which Sir Edwin pictures so well, if a number of our citizens cannot support life, cannot even purchase the bare necessities, what a cruel blow it must be to such a one to spend that "trifle," so ill spared, to purchase a newspaper, which, when he opens he is told he "can fare at home as Heliogabalus or Lucullus ever fared," on the authority of a great man. Fancy the agony on the poor wretches' face as he lights his last portion of adulterated "bacon," or munches his portion of crust smeared with margarine, to contemplate the situation. He thinks of that labour-saving machinery—which does, indeed, save labour, and produces such a quantity of manufactured goods from the raw material, that there is ever and anon a "glut" of the goods in the market, and the employer either ceases to produce for a spell, or puts the workfolk on such short time that they find they cannot live, and then they strike, adding thus to their miseries, meanwhile, the employer is gladdened, and gets rid in due course of his overplus, and then, after a show of resistance, he comes to terms, for he knows full well that there can be no wealth without labour. Labour-saving machinery must be a great success if it be true that this is a result, and I know of no one fit to be at large who is bold enough to deny it, but the workman only takes four letters from the word "success" and adds one, and spells it "curse."

Those "galleries rich with beautiful paintings," and whatnot, which open at 9 a.m. and close in the majority of instances at 5 p.m., purchased and kept up out of the poor labourer's hard-earned wages, perhaps not directly, but the fact remains that all wealth accrues from labour. They must look grand buildings viewed from the outside on a wet, cold morning as the artisan hurries to his work on the stroke of six, and equally interesting must be their closed doors at 5 p.m., as this atom of humanity trudges his weary way back to his fireside. But if, perchance the fellow is out of work, with leisure, it must, indeed, be a pleasure to contemplate those grand works with an empty stomach, and, perchance, to contemplate an "Ecce Homo," divinely painted, which brings home to him the words he heard the Sunday school teacher tell him. This man said: "Do unto others as ye would be done by," and "love one another," and mentally he hears the groans of his "missus," and the cry of the children for food. The writer knew a poor fellow who was out of work for no fault of his own, who, returning home after a fruitless search for something to do, found one of his children stricken down by typhoid fever, contracted by the child innocently playing in the gutter near a defective drain, in the richest city in the world. Civilisation had arranged a death-trap close to his house door.

"Civilisation" manufactures sweets and toys from poisonous materials to kill our children with, and *humanity* passes a law to prevent such things being sold, and *human nature*, in the person whose duty it is to put in force that law, winks at infractions.

"Civilisation" says that all things shall be pure and good, and milk must be sold pure and unadulterated, less the children suffer, and when the *maximum penalty* is enforced on the breaker of this salutary law it is frequently calculated that the offender has, spite of fine and costs, made a handsome profit from the

amount disposed of the day the milk-seller was detected.

"Civilisation" has given us railways that destroy more human lives in a year than the old coaches did in a generation; but the speed with which you are hurried to your destination is a compensation in the eyes of the majority, forgetting that this eternal hurry-scurry shortens human life, and begets neurotic ailments unknown in the last century.

"Civilisation" has much to answer for in lying prospectuses put forward to puff "Liberator" swindles and the like, and not suppressing them; and when the bubble is pricked, after the mischief is done, allowing the offenders to escape, and failing to bring them to justice.

"Civilisation," I am told, is not to blame, it is lying human nature and greed, but if the nineteenth century breeds such lying specimens of our race, perhaps it would be well to turn the handle of time back a century or two. Swindles have always been afloat, but civilisation increases the means of enlarging their dimensions and the catch of the net.

"Civilisation" has brought us in its train, new diseases, less security for human life, new anxieties, strikes, adulterated foods, new engines of war, which will destroy more lives in an hour than were killed on the field of Waterloo; it has bred anarchists, dynamitards, and revolutionists, all allowed, in this country at least, to air their dangerous doctrines without let or hindrance, lest freedom of speech be violated. The catalogue is long enough, but it could be added to indefinitely. Let Sir E. Arnold boast, when human ills are lessened, not manufactured, where there are no empty stomachs, and when men apply at the union for assistance they are not met with such a rebuff as the one noticed in *Truth* this week, thus:—

"The truly sympathetic spirit which pervades the administration of the Poor Law in the Epping Union was indicated at a meeting of the Guardians the other day. A labourer named Savill applied for relief, stating that he had been earning fifteen shillings a week, but had been discharged from his situation owing to shortness of work. 'Have you any money in the bank?' asked the chairman (Mr. G. Johnson), and Savill regretfully confessed that he had not. The irony of the question will be appreciated when it is explained that, upon the income mentioned, the man had to maintain himself, his wife, and four children. He added that they had no food whatever in the house, whereupon the chairman remarked: 'If you can't get work, you had better move on somewhere else. If you stop here, we can't help you and your family; and, what's more, we shan't.' As an exposition of good old-fashioned Bumbleism, these utterances of Mr. G. Johnson will not easily be surpassed."

When men, whatever they may think of Christ's divinity, live nearer the "Sermon on the Mount," and carry out its precepts, then it will be time to boast of our civilisation. Lastly, I would add, I do not object to be called a "pessimist," but a life amongst the poor and suffering, especially the latter, in the practice of my profession, has led me to answer this day-dream of a great thinker, who cannot, judged from his utterances, have any true knowledge of destitute suffering England. *The satisfaction with which he views civilised life is the measure of his success.*

We may take pride in being English, but do not let us forget that there are two sides to every question, and however distasteful it may be, the reverse as well the obverse should be studied, and the question to be viewed rightly must be kept free, as Sir Edwin indicates, from the dogmas of theology and the cries of the politician.

THE taxes are indeed very heavy; and if those laid on by the Government were the only ones we had to pay, we might more easily discharge them; but we have many others, and much more grievous to some of us. We are taxed twice as much by our idleness, and three times as much by our pride, and four times as much by our folly.—*Benjamin Franklin.*

"The FAMILY DOCTOR. Truly an Astonishing Pennyworth."—*Knowledge.*

[SPECIAL ARTICLE.]

## CARE OF THE HEAD AND HAIR.

MORE appropriately than many a kindred term is used, a woman's hair has been very properly called a "crown of glory." However plain and unharmonious her features, under whatever other defects she may suffer, the one who is blessed with a beautiful head of hair can never be wholly unattractive. This is well illustrated among the German peasantry, where the young women, though possessing few other attractions, have hair which is the envy of many a modern belle, and which very often, indeed, in a second-hand arrangement, forms part of the personal adornment of the "society" woman. It is very natural that this beautiful gift of Nature should be highly prized, and the woman who possesses a fine growth of luxuriant hair has a crown of beauty which she may well hold above price. In our country really beautiful heads of hair are comparatively infrequent. It might, perhaps, be gallantly urged that English ladies have so many attractive features that it would be unjust to the rest of the world that they should also excel in this direction; but whatever the cause of the deterioration, if such be the case, we should certainly seek to preserve and beautify as far as possible.

Physicians assert, and it seems at least reasonable, that the condition of the hair is an index to the health of the owner; that a scanty growth indicates impaired vitality, that where the hair is thick, glossy, and rich in colour, it indicates bodily vigour and health, and this is undoubtedly true. Another alleged cause for the scanty growth is the custom of keeping the head closely covered, and this is supported by the fact that the peasant women of the Continent, who work all day in the fields with little or no covering to the head, have the most luxuriant growth of hair. It is quite probable that both of these hypotheses are correct. Certainly the Breton peasant girl, toiling in the fields with the brawn of muscle and of endurance fully equal to that of her brother, enjoys a degree of health greatly superior to the larger proportion of our countrywomen—although we are not quite prepared to adopt that form of life, no not even for the sake of beautiful hair; but it is quite possible, by care and painstaking, to preserve and improve that which we have.

It does not matter whether the colour of the hair be the shining black, now comparatively rare in this country, and evidently becoming gradually more so, the rich chestnut brown, with its glossy sheen, the golden strands of which take a thousand new hues in as many different conditions of light, or the pale blonde which, possessing little of colour, has still an indescribable glory of its own. Each of these, with all the varying gradations of hue, if properly kept and attractively worn, has a beauty of its own, not by any means to be despised. Fortunately our people seem to have realised, for a time, this fact. We have had the craze for black, brown, and gold, but just now the sensible person seems to have reached the conclusion that Nature understands this matter pretty well after all, and that the colour she furnishes is the most appropriate.

Possibly the fact that black is becoming less prevalent, and the lighter shades are taking its place, may be accepted as an evidence of the advancement of the race intellectually, since scientists tell us that as a nation grows in civilisation the colour of the hair of its women becomes proportionately lighter. This may be merely scientific theory, but the thoughtful reader will immediately recur to the fact that in most savage races the black hair is a universal feature. However that may be, we must drop the theory before we get to individuals, because, as often occurs, a family of sisters possessing the same traits and dispositions and like degrees of refinement, may, in complexion and hair, present the most striking contrast. Usually, of course, the complexion, the eyes, and the hair correspond in hue. The black hair and eyes and olive complexion are naturally associated, while in the blonde we expect to see the hair and the skin in harmony,

with the eye of light blue or grey; yet this is by no means invariably the case. Black hair and blue eyes are not infrequently met, especially among the Irish, and there is sometimes a combination, such as hair of fiery red, with very light eyes, brows, and lashes, combined with an unpleasant complexion, which renders the possessor miserable. The texture of the hair depends very much upon its colour, and of a normal head the average thickness of hair is about 400 to the square inch; but the blonde is finest, with the brown, black, and red growing coarser in their order, so that it is estimated that the finest texture gives a total of about 140,000 individual hairs to the head. The brown would count up some 110,000, the black more than 100,000, while the red will fall below 90,000. These are approximate figures; any one wishing to obtain greater exactness can do so by a little patience and a careful count. A moderate estimate is that any of our readers, in their morning toilet, will dress from forty to fifty miles of hair in the very few minutes usually given to that necessary operation. As the ordinary hair has a breaking capacity of about four ounces, a rope composed of all the hairs growing from a single well-covered head would be strong enough to lift at least 25,000 pounds, or about 200 times the weight of the wearer.

The first and most important condition of preserving the health and attractiveness of the hair is that it shall be kept scrupulously clean, yet in many cases this is not by any means an easy task. There is nothing for which dust has a greater affinity than a thick head of hair, especially when slightly damp or oily. The flying particles lodge indiscriminately among the most attractive tresses or the unkempt shock of the careless labourer, and once lodged they cling with greatest persistence. Especially when travelling, the exposure to dust necessitates constant care in keeping the head and scalp clean. The face would tell its own story after a week or so of exposure, but the scalp is covered and the hair is a partner in untidiness. Usually hair which is brushed for a few minutes, night and morning, will require comparatively little extra care to preserve it in beauty and cleanliness. The brush is very much more efficient than the comb, but of course a time comes when neither will meet the requirements; and at reasonable intervals, depending on circumstances, a careful washing of the hair and scalp is necessary. This will be greatly assisted if a little ammonia or borax is added to the water, which should be merely warm, neither hot nor cold. Another very excellent application in this connection is an egg thoroughly beaten and well rubbed into the roots of the hair, which, of course, must be immediately and carefully rinsed, else the last condition will be worse than the first. It is a mistake to suppose that any hair-dressing, pomade, or other application of that sort, will cleanse the scalp. They merely add another element of vexation, attracting and holding the dust and the dirt, which a dry brush would very generally remove.

Promiscuous washing and frequent wetting of the hair is very detrimental, especially sea-bathing, unless the salt water should be carefully washed out of the hair with fresh, soft water, and the hair carefully dried. Keeping the hair damp has an especially injurious effect, not only rendering it brittle and rough, but causing a disagreeable odour, which is annoying to every one, and which can be easily prevented. When the head is to be washed, warm soft water with castile soap should be used. The hair should be immediately dried. An occasional shampoo, with a vigorous rubbing of the scalp with the finger ends, not only removes dirt and dandruff, but assists the circulation and promotes a healthy condition. As soon as the hair has been dried it should be carefully inspected. The broken ends should be clipped to promote the growth, and this can generally be as well attended to at home as at the hands of a professional hair-dresser.

Children's hair, of course, needs peculiar attention. That of the boys may be kept closely cut, so that it will present no problems to the mother or maid; but with girls it is quite different. After their hair has been allowed to grow long, it should not be cut, according to good authority, as it will never afterwards attain the length it would have

reached; yet many a mother thoughtlessly allows the hair of her little daughter to be shorn in order to save trouble in properly caring for it. In the case of children, even more especially than of adults, a frequent and thorough brushing of the hair is essential to its best condition. The brush should not be too harsh, and should be judiciously used. Under these conditions a child will delight in the proper care, rather than be repelled. A few pleasant words, with a gentle deftness in the manipulation of comb and brush, do wonders toward lightening the task.

For adults, as well as children, a universal motto should be "more brush, less comb." Gentleness and care in the use of the proper implements will make all the difference in the world in the condition of the hair. The brush should be fitted with natural coloured bristles, and it need not, for ordinary use, be very expensive. It should be firm enough to penetrate through the hair to the scalp, and not so harsh as to leave a smart following its use. This is one reason why the brush is better than the comb—especially the "fine-tooth comb," which should be pretty much relegated to oblivion. Its excessive use often leads to serious diseases of the scalp, the skin being broken, and particles of poisonous dust being pressed into the wound, causing soreness and sometimes serious results. A rubber comb is best, as the softness of its teeth is its recommendation. Any comb should be used very little except for parting the hair, but whether a comb or a brush be used, surely no wearer of long hair need be told that they should begin operations at the ends, and not near the roots of the hair, as by the latter method it is very easy to break and tear away the new hairs with a great detriment to the whole. Above all, do not fear to use the brush too generously. A recent writer tells of a school for young ladies where the requirement was that each student, before retiring, should give her hair 100 good strokes with the brush. Doubtless there was more or less murmuring, and perhaps some rebellion, but the fact remains that every one of the inmates had a beautiful head of glossy hair. If metal and horn combs should be tabooed, the metallic hair-brush and kindred contrivances should keep them company. Use brushes with bristles of moderate stiffness, use them faithfully but gently, and the result will not be disappointing.

There is another consideration in connection with the use of the hair-brush, which, though it may scarcely need mention, should not be overlooked. The brush should be kept clean. It gives one a shudder to see the brushes and combs that are sometimes supplied at places of public resort. No one should ever think of using a public hair-brush, unless it becomes a matter of absolute necessity; but the fact remains that the individual article requires to be properly cared for, else it becomes an instrument of danger rather than delight. If the case is not very aggravated the bristles may be washed in lukewarm water, to which a few drops of ammonia can be added. This will clear away the accumulated dust and dirt as by magic. The bristles can be rinsed in pure water, and allowed to dry in an airy place; the brush should not be exposed to the sun, nor should the back of it be wet at any time. Soda and soap soften the bristles, and if the back of the brush be of ivory it will turn yellow by their application. For general use it is better economy to buy a cheap brush, and, after using it for a reasonable time, throw it into the fire and start afresh.

Most of our readers will prefer to care for their hair at home, either themselves or at the hands of a maid or a family friend; but sometimes it is desirable or necessary to employ a professional hair-dresser. Fortunately these are now to be found in all towns, and even villages of a moderate size, and most of them are quite proficient and trustworthy. It is a part of their profession to attend ladies at their residences, where it is preferred, and in case of any affection of the scalp, it is very often desirable to have such services, which may be as effectual as those of a physician.

So much for the general care of the hair in its normal condition. There are other considerations which should be briefly referred to; and while some of them may conflict with the demands of fashion, they should nevertheless

be urged upon the attention of the thoughtful woman. If rough use of the comb or the brush be deprecated, what shall be said of many of the methods of curling and crimping the hair, by the use of hot irons and other appliances, in which the life is roasted out of it, its gloss and beauty destroyed, and its growth paralysed, in order to produce a supposedly "charming effect"? "It is the fashion!" is an answer which admits of no argument. But the fact remains that if the real beauty of the hair is prized, the hot iron and its kindred accompaniments should be pitched out of doors. Soap is sometimes used as an assistant in curling and crimping processes, but that also is injurious; the least harmful is the white castile soap, on account of its small percentage of alkali. Cold tea is well known as an aid in curling the hair, and a simple decoction may be prepared by simmering an ounce of quince seeds in a quart of water for twenty minutes, straining and bottling for use, the liquid being scented with some favourite aroma, if preferred. The white of an egg is also sometimes used, or a thin solution of isinglass. All of these are harmless in every respect.

(To be continued.)

## CREMATION AT THE CHURCH CONGRESS.

IT is a somewhat curious illustration of the advance of the modern cremation movement, that between three and four columns of last Saturday's *Times* were filled by a report of a discussion at the Church Congress on the disposal of the dead, in which cremation was chiefly concerned. Dr. Bostock Hill, Professor of Public Health in Mason College, Birmingham, the Rev. Brooke Lambert, and Sir Douglas Galton all advocated cremation very forcibly, while Mr. Seymour Haden and Dr. Poore opposed cremation and advocated earth-to-earth burial. The Rev. F. Lawrence, the indefatigable Secretary of the Church of England Burial Reform Society and Sanitary Association, in a sermon on behalf of these societies, preached during the Congress on the text, "A sower went forth to sow" (Matthew xiii), said that such as the sowing was such would the harvest be. From the seeds sown of diphtheria, consumption, and other diseases communicable by germs, the harvest of deaths in 1890 in England and Wales alone was nearly 70,000. Such seeds should be destroyed, and in their place the seeds sown of health, strength, and long life. But these could grow only in an environment of cleanliness, fresh air, pure water, dry soil, and wholesome dwellings.

We are glad to welcome such teaching as this from the pulpit, and also to find that at a meeting during the Congress of the Church of England Sanitary Association it was resolved to send the following memorial to the President of the Local Government Board:

"Your memorialists represent a society which has for one of its objects to aid in securing for all the greatest possible immunity from infectious diseases; your memorialists ask you to take such steps as shall render imperative by law destruction before burial of the infectious germs remaining in the body when death has arisen from cholera or from any other disease communicable by germs."

The Cremation Society of England has never endeavoured to make cremation compulsory. It has very wisely been content with the attempt to influence public opinion by making known the evils which must follow burial in the earth of the entire dead body, even when death has not been caused by infectious disease. Of course the argument is strengthened when a body full of infected germs is buried, and the advocates of cremation use this as the chief objection to the earth-to-earth system. But it would, we think, be very unwise in the present state of the public mind to attempt to enforce cremation, even during the spread of an epidemic of infectious diseases. Let the public once become convinced that their health and lives are endangered by the burial, near the living, of poisonous dead bodies, and the demand for protection would come from them. This would be far better than compulsory legislation.

It has been said and repeated of late that our Cremation Society has not done much good, and that the movement has progressed very slowly. In our opinion this reproach is absolutely unfounded. It is not yet ten years since the first human body was cremated at Woking, yet since the first in 1885 till the end of last June, more than four hundred have been reduced to ashes there. A crematorium has been finished at Manchester, where more than twenty bodies have already been cremated. At Glasgow and Liverpool works are in progress. Even if nothing more had been done, we think that the society has a just claim upon the gratitude of all who are interested in the promotion of public health. At first the society encountered and overcame the opposition of Government; it proved that cremation was not illegal; and it answered a variety of objections, sentimental and so-called religious; and, most important of all, the medico-legal charge that it might conceal poison or murder, and so act as an incentive to crime. Anyone who will refer to the report which we give in another column of the Birmingham meeting, may judge without any help from us how much the cremation movement has been advanced of late. What the Government may do upon the report just issued of the Select Committee of the House of Commons upon Death Certification remains to be seen; but we trust that in the hands of Sir Walter Foster and Sir Charles Cameron the scandalous negligence so common in the United Kingdom will lead to more careful inquiry in every case of death, and more accurate certificates, before either earth burial or cremation be permitted. The discussion at Birmingham must be regarded as a distinct encouragement by all advocates of cremation.—*British Medical Journal*.

## THE DEGRADATION OF MODERN ATHLETICS.

WE are, says the *Lancet*, so firmly convinced that the reasonable pursuit of athletics—that is, a pursuit that makes only such demands upon the time and health of its votaries as they can afford to honestly give—must work for good amongst all classes that we are very sorry to have to endorse the strictures which have lately been published upon the tendencies of certain modern athletes. The athlete in England has hitherto enjoyed a high reputation for purity of motive in his struggles. Many of us—probably those who knew least to the most marked degree—have believed that the chief reward in the athlete's eye was the sensation of honourable distinction in a competition promoted, secondarily perhaps, for the distribution of prizes or the gaining of challenge-cups, but primarily for the maintenance by healthy rivalry of a high physical standard. But coincidentally with the enormous increase in the popularity of football and of public athletic meetings, there has come to light the existence of a widespread tendency to make the practice of athletics a source of livelihood, and some of the methods pursued with that intent go far to show that the healthy body of the athlete may envelop a mind in a considerable condition of moral disease. This much is generally conceded; what remains to be found is a remedy. It is not exactly our province to suggest expedients for the remedy of this state of affairs; but one thing seems to us certain—that the purification of the running-path and of the football field can only come about by the co-operation of the gentleman and the player. In cricket the paid and unpaid work together in harmony, and it seems to us that the same spirit ought to prevail in other departments of athletics. Believing, as we do, that a certain amount of game-playing is a serviceable factor in English education, it is a matter of no little concern to learn that two important branches of athletics have been seriously impeached; and it will please us proportionately to hear that united effort on the part of some of the more distinguished athletic clubs is to be taken to remedy the evils.

NOTHING is felt more keenly than the malign shafts of calumny, and even the worthiest man is hurt if they reach him.—*Thales*.

## THE GIRL THAT WILL BE WANTED.

BY A COUNTRY PARSON.

THE coming woman is anxiously awaited by the twentieth century. She is but a slip of a girl now, but when the new century dawns, with all its gracious promises, she will be there to meet it, equipped for its victories and its defeats. Indeed, is it too much to say that the girl, a woman then, may do much to prove that life is worth living in the new century? Society and civilisation are to be determined largely by women. Whether they be allowed to vote or not, they will have a part in moulding of human life. This is a strategic point—the training of our girls. Mothers have a large responsibility put upon them in the nurture of their daughters. It is becoming increasingly difficult to lead them along the perilous path to a gracious womanhood.

What shall be the characteristics of the girl that will be wanted in 1900. (1.) Genuine modesty; an intelligent purity of thought and act. Innocence is not prudery, ignorance is not virtue. Our girls should understand the perils and dangers that beset this temple of the body; they should have an exact and truthful knowledge of the mysteries of physical life. The bloom of the blushing peach is not impaired by insight into the mystery of prenatal life, birth, and progress toward maturity. No shadow will lie on the consciousness of any maiden, because she is perfectly aware of the obligations the fact of her sex has conferred upon her. She should have a frank and genuine interest in those questions which the vile may have distorted to their own evil purposes, but which are a legitimate subject of thought. An honest, intelligent contact with physiological facts will be as a corset of steel to protect her maturing life.

Modern life threatens genuine modesty in our girls; ignorance is often allured by flippant word into unwise thought. Modesty is the basis of all noble womanhood; it is the flower of maidenhood, the inexpressible charm of every young girl. It is not ignorance, a simpering prudery. It is the citadel of a pure heart.

(2.) A robust physical life; less nerve, more muscle. If the coming girl is not to be a "bundle of nerves" in 1900, the basis of a healthy, physical life must be laid now. The nervous system is abnormally developed to-day; the body is allowed, often, to adjust itself to the heavy demands made upon it. The girl that will be wanted by and by must have more muscle. Invalid women are the rule in every community of life. Is it a dispensation of divine providence that such is the fact, or are there purely physical causes that have much to do with the frail tenure many of our women have upon life? Is this deterioration of physical fibre to go on, the house of clay but a weak and shaking structure for life, attenuated to the very last degree of sensitiveness? Misery, madness, and death lie along this line. There will be room enough for the girl who has a robust, physical life, whose body is not the asylum of a tortured spirit. Culture that neglects the body is preparing a scorpion whip that will lash the physical life into despair. A sound body will be the crying need of a coming age. The coming girl will be handicapped by generations behind her, but something may be done for her. The extreme finish of her culture she may spare, but not a particle of vitality.

(3.) "Faculty." Ability to turn one's self, power of adaptation, skill, knack, the happy turn to meet the present moment. How much it can accomplish sometimes! Its presence or absence may decide grave questions; often, the girl that has it, in that century so soon to be ushered in, will find a large place to fill in life, and duties rich in results to her hand. Its possession is more valuable than the polish of foreign travel, the veneer of society contact. It is indispensable to the mother of the home, if she is to reach the large ideal of her life. Its absence has rung the knell of domestic peace in many a home. Only the school of experience will teach it, the seminary and society cannot

## COOKERY AND ETHICS.

By EDOUARD LOCKERY.

It is not only politics that retard the social question, it is also hygiene and medicine.

To regulate the rate of wages, the duration of hours of work, to prevent accidents, and to offer indemnities to women about to become mothers, is all very well. Parliament is quite adequate to regulate questions of this kind. But to preserve the vigour and elasticity of individuals, to maintain health, and to prolong life, is the business of science; here deputies and even senators are of no avail. Universal suffrage, though of paramount importance, does not give them this authority.

This is very important matter, nevertheless for before we live well we must exist, before winning our bread by work we must first be able to work. A philosopher has said, "Health is the first of all gifts," and he was not mistaken, since without it it is impossible to enjoy others.

Now the first condition in order to live and maintain the health is to eat well. That does not necessarily imply to eat much. No; to eat well implies eating so as to restore strength, to repair the tissues which life consumes, and to give internal heat necessary for action. To do this—and this is what the German, Professor Sée, has recently demonstrated in an admirable little book—it is necessary to choose one's food. The most suitable are often, it may be remarked in parenthesis, the commonest, and those which are to be found in the best markets. The fare of the poor appears at first sight to be infinitely more hygienic than that of millionaires.

About the middle of the present century science recognised that heat and motion were two identical things, or rather were one and the same thing. Heat is transformed into motion and motion into heat. This is *kif-kif*, as the collegians call it. To give heat to the human body, is then to give it force, or if you wish, power to act and move. Our food contains more or less heat; this heat has been measured. It is expressed in "heat-units"; a heat unit is the amount of heat necessary to increase the temperature of one pound of water by one degree Fahrenheit. Experience has shown that albumen contains almost as many heat units as starch or sugar, and that fats contain as much again as sugar, starch, or albumen.

And from that, therefore, it is possible to conceive an entire nutritive system. Unfortunately, the human mechanism is a mechanism of a very particular order. You have often seen locomotives; they are fed with coal. There, again, heat produces motion. But in the case of the locomotive, the fuel alone burns and becomes cinders and smoke, whilst the connecting rod, cylinders, all the parts in short—castings, iron or steel—remain intact, whether at rest or in motion, they have nothing to fear from the flames within.

It is different with man, who, from a certain point of view, may, perhaps, be considered as a locomotive; this locomotive thinks, speaks, takes up science, politics, literature, art, and many other things besides, but after all, it lives like other machines. It has even in one respect a deplorable inferiority; its organs burn and destroy themselves continually, be they in action or repose, the fire within devours them.

Since the locomotive is such, suppose a locomotive whose different parts disappear in cinders and smoke at the same time as the coal during the journey. It would be necessary in that case to supply the machine, not only with combustible material necessary to propel it, but also with castings, iron and steel, to make up in proportion to the metal lost. This is precisely what one does for man, or rather what man does for himself. He replenishes the organ destroyed by means of food, and the albuminoids are charged with this daily reparation.

Not to continue the metaphor any longer, the albuminoids are first of all fibrin, which meat contains; caseine which is found in milk, cheese, and dry vegetables; lastly, albumen, which is in the white of an egg. All these things serve to re-make our tissues in order to replace those which are consumed. It goes without saying that we "burn" much more during work than

when in repose, consequently a manual worker, even an intellectual one, finds it necessary to restore himself more abundantly than a man who does no work. Look at the man who tills the ground all days, or tows boats along a long river, he burns without appearing to do so, like a simple contraband match—for one knows that those of the excise never take fire—and, unhappily, no effort of the fire brigade can put him out. Albuminoids are most necessary to him when the night comes, in order to replace those which combustion has dissipated for him.

Formerly 118 grammes was the quantity of albuminoids considered necessary for the daily replenishing of an adult. The German, Professor Sée has reduced that proportion almost half. It appears that about fifty grammes is sufficient. The experiment has been tried, and it is conclusively proved. Let us keep to fifty grammes. To go further, as the most experts *survants* of France and Germany, say, "It is to waste albumen." Now in human economy as in political economy, waste is absolutely to be condemned.

But if one reduces the absorption of albuminoids to any great extent, it is necessary to augment those of fats or sugars. The fats have that property of preventing the albumen of the tissues from being heedlessly consumed. They are the saving of food. Gelatine, which is found in the cooking of meat, or which is found in broth, renders the same service. You have a chimney drawing very hard, and where the wood is consumed very quickly. You place coal there, and the combustion of the wood is relaxed. The coal in this case plays the part of gelatine and of fats.

Do you know one very curious thing? That is, that alcohol perhaps renders services analogous to those of gelatine. I have been very much struck lately to see that science is extolling broth and re-establishing brandy. People say to you, no doubt, that this poor broth—the broth of our fathers—this broth that we consider so inoffensive and beneficent, has been the object of a great examination on the part of certain doctors, one of them has gone so far as to call it a "solution of poison," one accuses it of containing too much potash. But lo, M. Bouchard, absolves even potash! Potash! Why spinach, cabbage, chicory, and even potatoes, are full of it! Surely, then, one can drink broth with a clear conscience, and without dread of intoxication.

One may even drink alcohol. At any rate alcohol, which without doubt has its inconvenience, has at the same time great advantages. In the new book of M. Sée, of which I spoke just now the *formulary of nutriment, old and new*, which is a complete treatise on the matter, written by one of our great medical men, alcohol is much better treated than I should have thought. Perhaps one should not believe all the evils hygienists have to say of it. And, besides, it possesses a quality of which Professor Sée does not speak, and which I for my part appreciate; it brings plenty of money to the State, and helps us to balance the budget.

Fish, too, have been very much maligned. Much has been said of the evils of turbot, herring, salmon, &c.; it is necessary to fall back upon it, and their flesh is worth as much as meat. Bass, among others, give more albumen and gelatine than beef.

Veal sweetbread is perfect, and the brain excellent. One can only speak well of butter. Peas and lentils contain up to twenty-four and twenty-five per cent. albuminates.

Macaroni is not wanting in merit. Potato soup is very nourishing, and milk appears altogether admirable. The eggs of tenia are found in salads, and even in cabbages and radishes. Chocolate has more nutritive value than cocoa, from which it derives its origin. Coffee is eminently useful.

Of a truth, all depends upon temperaments and stomachs. What suits one does not always suit another. One ought, however, in a given time to arrive at an exact determination of the allowance necessary for each man; as one calculates beforehand the amount of coal which an engine requires to set it in motion. That will be a great step. And when we have the solution of the problem in our hands—we shall claim for workers, in the name of humanity, as in the name of public prosperity, not only the right to work, but also the right of logical nutriment.

impart it. A girl has never "finished" her education until she has something of it. It will often supply the place of technical knowledge, and enable one with limited parts to occupy responsible places in life. The coming girl needs this above all—"Faculty." Will the training of to-day evolve these characteristics? Some facts intimate the negative.

*The character and atmosphere of our fiction.*—There is much of the fiction of the present day that distils poison. It leaves a subtle blight upon the half-open rose. It destroys the frank gaze of childhood. It suggests the question often—"is life worth living?" Genuine modesty is not fostered by much of our popular literature. It breeds discontent, it sugar-coats evil, it covertly sners at virtue. Healthy, inspiring fiction always has its place. It is peculiarly attractive to girls; but when genius casts a glamour over evil, and hides it under the witchery of words, no girl can breathe the vitiated atmosphere and have a healthy, moral life. The book in the hand will undo the training of years. Motherhood, with all its sweet influences, is no match for brilliant genius, suggesting evil, in a fascinating book. We do well to exercise a wise caution in the books we allow our daughters to read; a serpent may be concealed between the attractive covers.

*The neglect of health-producing habits and sensible physical culture.*—Late hours, hot rooms, continued excitement are doing their work. Even the sea, the fashionable spa, the grand tour, will not replace exhausted vitality. The girl buds into the woman in a moment, and her physical life is not prepared for the new demands then to be made upon it. The habit of life which the English girl has acquired will never produce a sound mind in a sound body. She neglects her body fearfully, and she gives little attention to systematic, scientific training of her corporeal life. These facts have their exceptions, but the custom of the age is true to these statements. The temple of God is fast losing its divine outline. When it shall become fashionable to make physical health of the first consequence, and adopt a scientific culture to that end, there will be the promise of a generation of girls that will be wanted.

*The failure to put personal responsibility upon our girl.*—She is guarded too closely. She is sheltered too carefully. I know a young lady, happily married, who boasted, soon after, that "she did not know how to do housework, and she was not going to learn." What a future there is for such a girl! The mother who neglects to teach her daughter in household lore, who never places responsibility upon her, who makes a baby of her until she is married, is guilty of a grave mistake. She has much to answer for. The social and domestic tragedies that are so frequent might, perhaps, have been avoided, if the mother had really been a mother to her child. Most homes offer a school for the growing girl where she may develop a helpful life, if the mother, at the expense of her own life, does not bear all the domestic burdens.

The girl that will be wanted will have much to do in moulding a nation yet unborn. If she have genuine modesty, united with a robust physical life, and possessing faculty, she may do much in making this old earth an Eden.

In the vain and foolish exultation of the heart, which the brighter prospects of life will sometimes excite, the pensive portress of Science shall call you to the sober pleasures of her holy cell. In the mortification of disappointment, her soothing voice shall whisper serenity and peace. In social converse with the mighty dead of ancient days, you will never smart under the galling sense of dependence upon the mighty living of the present age. And in your struggles with the world, should a crisis ever occur, when even friendship may deem it prudent to desert you, when priest and Levite shall come and look on you and pass by on the other side, seek refuge, my unfailing friends, and be assured you shall find it, in the friendship of Lælius and Scipio, in the patriotism of Cicero, Demosthenes, and Burke, as well as in the precepts and example of Him whose law is love, and who taught us to remember injuries only to forgive them.—John Quincy Adams.

"The FAMILY DOCTOR ought to have a very Wide Circulation."—*Weekly Dispatch.*

## BLAUD'S PILLS.

THE uselessness of the iron combination usually known as Bland's pills has been long recognised by the medical profession, for to get the iron absorbed by the blood such enormous doses have to be taken as to seriously affect the system. They cause indigestion, besides being very liable to set up an obstinate constipation, which to the delicate female is a most injurious symptom. Now, the object of the inventor, Dr. Bland of Paris, was to administer perfectly pure carbonate of iron; but this salt is so extremely delicate, that unless the pill is taken immediately it is prepared it becomes oxidised, and useless. One of the most ingenious devices that has ever been placed before the medical profession is the "Bipalatinoid," for the formation of perfectly pure carbonate of iron in the stomach. In appearance the Bipalatinoid is similar to a very elegant pill, but upon opening it we find a thin septum of jujube stretching across the centre, thus preventing the salts acting one upon the other. But when the liquid contents of the stomach are reached, hey, presto! the capsule opens, the two salts re-act, and pure carbonate of iron results. A most clever and excellent idea. Recently some most remarkable results have been recorded in the Medical Annual for 1893. Thus people with extreme anæmia, or bloodlessness, with pale cheeks, blue lips, listless manners, and dull eyes were treated and restored to a perfect state of health with the rosebud of health upon their cheeks, cherry lips, and all the other symptoms of a healthy condition of the blood in three weeks only by the use of two of the Bipalatinoids of Carbonate of Iron three times daily. These are the most astonishing results ever recorded. It does not matter for what purpose you take Bland's pills, iron pills, steel pills, or other forms of iron, replace them at once by the Bipalatinoid. The medical profession have long since given them the preference, for they are never associated with the disagreeable symptoms of other preparations of iron. They never constipate, they never cause indigestion, they never discolour the teeth; above all, they can be much more easily swallowed than pills; even children, and those who experience difficulty in taking pills, swallow these Bipalatinoids of Carbonate of Iron without effort.

## MUSICAL DRILL.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—I should much like to write a few words in reference to the advantages of musical drill. The benefits gained in health and figure from such a wholesome and pleasing exercise are considerable. Many lads are not able to take their part in the energetic games of football and cricket, and musical drill supplies a capital exercise; and even those who can go in for more vigorous athletics would be all the better for a spell of it, as the harmony and stateliness of the required movements are excellent remedies for uncout and rough manners.

I have for some time introduced this admirable exercise into my school with marked success, and my pupils—lads from twelve to nineteen years old—go through it three times a week. It has had a marvellous effect on their figures, and their parents are much pleased with the results. My wife superintends the class, and on these occasions the boys wear a pleasing uniform, which adds to the grace of the performance. When their young mistress has inspected the class she gives the signal to the music master to commence a lively tune on the piano.

It is an interesting sight to see the perfect and regular order with which they swing their bodies and go through the movements, each holding a pair of dumb-bells suited to their individual strength. My wife stands before the class, and frequently takes a pair of light dumb-bells and shows her pupils what she wishes them to do. She considers an hour and a half sufficient drill for the juniors. The elder boys go on for half an hour longer, and sometimes she gives

Just published, 1s., post free 1s. 1d.

THE PHYSICIAN, A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

any of the latter who have failed to please her an extra hour with really heavy dumb-bells.

A propos of the subject of tight-lacing, she give the exercise while wearing her tightest corset, and yet she can sway her slender figure in the easiest and most graceful manner. The movements of the feet as well as the arms form an important part of the drill, consequently my wife wears for drill the same costume she wore at school for such an exercise. She is only eighteen, and therefore has had quite recent experience at an establishment where such a pleasing exercise was taught. As the short days are drawing near, many of which will be quite unsuitable for outdoor recreation, may I strongly advocate the more frequent use of musical drill as an invigorating exercise.—Yours faithfully, EXERCISE.

MILITARY TIGHT-LACING IN RUSSIA.  
TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—As I promised in a previous letter, I have translated the following account of the lacing practised in the Russian Military College at Moscow in 1890. The author, Tschikagow, in describing his life as a cadet, states:—"My body was then compressed in a long corset of a strong cotton material full of bones, which had been made for me on arrival at the college. We stood in a row, and each hooked together the front of his corset, and we were then, in succession, laced up till the corsets met behind. The corsets came nearly up to our armpits, and lessened our waists by about one-fourth of their circumference. Our young bones at fourteen years of age offered but a poor resistance to the practised skill of the corset makers, who drew us in with a rapidity that made us breathless, and then knotted the lace. The tailors then measured us for our uniforms, which fitted over the corsets with extreme tightness. Our civilian costume was then sent to our homes, so that from that time we could not wear anything but our uniform, and that only by the aid of the stays. We laced each other up in the morning, and severe was the punishment we received if our uniforms were strained by an insufficiently-laced corset. We felt little pain at our outdoor work, but sitting at our desks numbed and scored our young bodies terribly. The senior cadets delighted to inflict on us all the rigors they had themselves endured, and punished any breach of cadet etiquette by lacing us in very small corsets they termed the 'tortmentors'. Once these were fastened they were kept unloosed for days, when they well earned their name of 'tortmentors'."

Further on the author describes two years later, when the vanity of young men led to extraordinary extravagance, but of this more anon.—Yours truly, A. WILLIAMS.

## Notes &amp; Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

## QUESTIONS.

DOG.—Could some reader advise? I am a little puppy ball-terrier, three months old, of lively disposition, but every four or five days I suffer from nausea, and vomit, which lasts till noon and I am right again. I am also affected with worms; I am told to take some santolin and calomel, but no one can induce me to take anything.—YATES.

HOUSE AGENT.—Must a licence be taken out for conducting this business, if no selling takes place but simple letting? If so, what is the fee?—JONES.

## ANSWERS.

PALL MALL.—Is so called from a game of that name played there, Mall being a species of bat, and Pall another form of the word ball. How the pronunciation ever came to be mall, I think must be referred to the caprice of fashion, which has no rule. Webster gives the pronunciation as mall, short. We say, "I met such a one in the Mall." But at the same time Pall Mall, which took its name from the walk in the park adjacent, is always Pallmal when named. This defies all law and rule.—Thompson.

LOAN.—An I O U cannot be used as a receipt; it is merely an acknowledgement of indebtedness, the effect of which is to throw on the person giving it the onus of showing (if he can) that he was not indebted according to his own statement. It is not conclusive, for the giver may be able to prove that it was given inadvertently or was inaccurate.—Tim.

RUPTURE.  
ATKINSON'S PATENT TRUSS  
For the RADICAL CURE OF RUPTURE  
IS A  
Certain Remedy.

REPORTS OF LANCET, BRITISH MEDICAL JOURNAL, HOSPITAL GAZETTE, MEDICAL PRESS, PRACTITIONER, CHEMIST AND DRUGGIST, HOMOEOPATHIC REVIEW, ILLUSTRATED MEDICAL NEWS, &c., post free on application.

B. F. ATKINSON,  
7 Mill St., Hanover Sq., London, W

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

## ADVICE GRATIS.

BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

## The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c. :—

King's College Hospital.	Nazareth House, Ham-
University College Hos-	mersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

CHARLES POWELL.—You must avoid all hot things, and if there are any bad teeth in your mouth you must have them attended to. Take the following medicine: Iodide of potassium one drachm, chlorate of potash two drachms, decoction of bark to six ounces. One-sixth part three times a day. Refrain from all smoking and alcoholic beverages; otherwise live as well as you can afford, and get plenty of fresh air.

SPASMODIC.—You had better take a cold or tepid bath every morning, and get plenty of active outdoor exercise—not merely walking, but running and jumping, gymnastics and athletic sports generally. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, followed the next morning by a mild dose of aperient fruit salts. When you go to bed at night be careful to refrain from sleeping on your back. This may be accomplished by your tying a cotton-reel in contact with your back, so as to prevent your sleeping on it. Be scrupulously clean, washing the parts regularly with soap and water. Take a teaspoonful of Easton's syrup three times a day immediately after meals.

MIGNON, G.—Excessive standing is in your case, as in so many others, the cause of your troubles. That is more than proved by the relief obtained after your short holiday. You should try to obtain an hour's rest on your back each afternoon, commencing three days before the period, and continuing altogether for six days. Take the following mixture at 8 a.m. and 10 p.m., as well as once during the day if the pain is excessive: Bromide of ammonium twenty grains, fluid extract of black-willow half a drachm, tincture of oranges half a drachm, water to half an ounce. Keep the bowels acting with a nightly dose of compound liquorice powder (one teaspoonful, more or less), and let us know the result in a few weeks' time.

S. A. H.—This is a very common complaint among young women, and the best thing for her to do is to sit in a warm bath frequently and take twenty grains of bromide of potassium with ten drops of chlorodyne three times a day. Massaging the abdomen is of no use at all. With regard to the other matter, we should advise the injection of alum in water or lime water, a quart or so three or four times a day. Spraying is of no use whatever—in fact, more harm than good.

130th Thousand Post free of Author, 2s. 6d.

THE CURE OF  
CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, &amp; CATARRH.

By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S., Late M.R.C.S. Eng., late Consulting Surgeon to the Lower Clapton Orphan Asylum, &c., Lynton House, Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

## THE SANITAS CO., LTD., BETHNAL GREEN, LONDON.

(Sole Manufacturers also of the famous "Sanitas" Disinfectants.)

**EMMELINE.**—The additional information was not at all unnecessary; on the contrary, it is of great importance in giving the clue to the causes of the difficulties. Take liquids only after each meal is finished, eat your food slowly, and take the mixture ordered for "Mignon" in this column. Use also every morning a tepid injection containing a teaspoonful of powdered alum to each pint of water. In order that this may be done effectually, you must obtain a Higginson's enema syringe with a properly-adjusted nozzle (any chemist will supply one for three or four shillings).

**KATHLEEN.**—We would much rather you had given us a description of the rash which appears on your face, instead of calling it erythema, almost erysipelas. The probabilities are that you are generally very delicate, that your nerves are out of order owing to constitutional changes or other causes. You must have your diet regularly, and refrain from hot tea in excess. Take plenty of active outdoor exercise, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Take the following medicine: Bromide of potassium one drachm, syrup of oranges two drachms, chloroform water to six ounces. One-sixth part three times a day between meals.

**SHIPWRECKED.**—In the first place, who told you you were suffering from the disease you mention? What are the symptoms you refer to, and why do you consider them to be those of the trouble you mention. In any case, the treatment would be exactly similar to what you are doing, so you cannot do better than go on with it.

## EASTON'S SYRUP.

**WHENEVER** this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Sold in 4-oz. bottles, 1s. 6d.; 8-oz. bottles, 2s. 6d. 16-oz. bottles, 4s. 6d.

**POPGUN.**—We cannot prescribe for this state of things, for, even it were likely to be efficacious, which it would not be, it is strictly illegal. You must put up with the consequences of self-indulgence.

**RAWDON.**—You have not attempted to give any description of the state of affairs. How are we to know what is the matter if you do not tell us?

**CLOUGHANE.**—You had better take the advice we have given to "Naomi" with regard to your hair. It is impossible to ascribe a cause when we know nothing of the local conditions. With regard to your teeth, the best thing you can use is precipitated chalk powder with camphor. Take a tonic as indicated.

**F. M. D.**—You have omitted to tell us what your habits and occupation are. We should advise you to take a cold bath every morning, and to get plenty of active out-door exercise during the day, not merely walking, but gymnastic exercises and athletic sports. Refrain from eating too much bread, potatoes, pasta, and puddings. Keep the bowels freely open by means of the following pill: Extract of socrine aloes one grain, extract of nux vomica half a grain, extract of belladonna quarter grain. The pill to be taken every day immediately after dinner. Eat lightly cooked food, boiled fish or fowl, green vegetables, &c., and take the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day.

**WALTER.**—Take the following powder: Powdered borax seven grains, chloride of sodium and bicarbonate of soda, of each, seven grains, powdered white sugar fifteen grains. Dissolve in a half tumblerful of warm water and sniff up into the nostrils and out through the nose. Repeat the operation every day. Keep up your general health and take a teaspoonful of Easton's syrup three times a day immediately after meals. Keep the bowels freely open.

**H. A. F.**—There is no drug which administered internally will produce the effect you desire. If you should, at the desired time, find yourself wanting, if you place yourself in communication with us we shall doubtless be able to suggest some satisfactory form of treatment. As a matter of fact there is only one form of treatment for complaints of this nature, and that is by electricity.

**NAOMI.**—Either you are considerably below par or else your loss and early greyness of hair must be due to hereditary causes. All applications made to the hair are likely to do more harm than good if used without sufficient reason. That is to say, that you ought to consult someone who has special experience of hair troubles and can judge of the actual condition of the scalp. Meanwhile, live well, get plenty of fresh air, keep the bowels freely open, and take regular exercise; also a teaspoonful of Parrish's Food three times a day immediately after meals.

**COLIN.**—You had better go on with the treatment as hitherto advised. If another month or so does not effect any improvement, we should advise you to send a stamped envelope, and we will advise you whom to consult. You speak of enclosing an envelope in your present letter, but have either forgotten to do so or it has accidentally disappeared, for we do not see it.

**MISERABLE.**—We are very much afraid we cannot do anything very satisfactory for your blushes. This extreme sensitiveness, you will find, will disappear with the accumulation of years and knowledge.

**B'HAM.**—You will never be able to cure this by means of suspensory bandages, supports, &c., which will, it is true, support, but will not finally remove the diseased veins. It would be better for you to have them operated on before taking the serious step you contemplate. The operation is simple, painless, and will not necessitate lying up. You had better send a stamped addressed envelope, and we will recommend you a surgeon.

**PAINTER.**—You should wash the feet every night and morning in cold water, using plenty of soap, and, after thoroughly drying, dust the boots and socks with boracic acid powdered. Wear clean socks every day, and have different boots every day. Look after your general health by means of cold baths, plenty of exercise, good food, and a teaspoonful of Easton's syrup three times a day immediately after meals.

**DEBILITY, Notts.**—The fact is, you are suffering from indigestion, and that gives rise to symptoms in all directions. You should take a cold bath every morning, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Have your food quite regular, and see that it consists of plain nutritious food. Take plenty of active outdoor exercise and the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia two drachms spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day.

**BUSINESS.**—You had better see a medical man about yourself, if you think you are deformed. We cannot tell you whether you are or are not without a personal examination, nor can anyone else. Who put the idea into your head?

**FRANK VERNON.**—We are unable to state what is the condition of the fluid you speak of without a proper examination. You must, of course, give yourself a rest and be less indulgent. The best and we think the only satisfactory form of treatment for you would be electricity. But this cannot be applied by anyone. You must go to a specialist. In the meanwhile, keep the bowels freely open, take plenty of active outdoor exercise, and take a teaspoonful of Easton's syrup three times a day immediately after meals.

**HOPEFUL MAN, W. H.**—You had better note our reply to "Frank Vernon" above. The same form of treatment is about the only one from which you are likely to experience beneficial results. However, you can try the line of treatment we have pointed out to him, and watch what the results are.

## FADING EYESIGHT.

Thirty years' practical experience has proved Mr. Bluett's system of sight testing by examination of each eye separately to be the only perfect method of accurately determining the lenses required to restore the vision, and make reading or working a pleasure.

Consultations Free. Spectacles at Store prices.

**F. J. BLUETT,**

Specialist in Spectacles, and author of "Defective Vision, its Cause and Cure."

8A, GT. PORTLAND STREET, LONDON, W  
(FOUR DOORS FROM OXFORD STREET.)

## DUNN'S FRUIT SALINE

This PURE preparation is a quick relief for Sick Headache and Derangements of the Stomach and Liver, Purifies the blood and is delightfully refreshing. Through Chemists and Stores.

**SPECIAL OFFER.**—To prove its efficacy, 1s. 6d. bottle will be sent post free for 1s. 6d. stamps. Works: CROYDON, LONDON

**WILLIAM.**—You are doubtless suffering from chronic colic. The best thing for you to do is to dress yourself as warmly as possible in woollen garments, eat plenty of good food at regular intervals, take plenty of active outdoor exercise, not merely walking, keeping the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Internally you had better take a teaspoonful of Easton's syrup three times a day immediately after meals. Locally use the following lotion: Powdered borax, chloride of sodium, bicarbonate of soda, of each seven grains, powdered white sugar fifteen grains. The powder to be dissolved in half a tumblerful of warm water and sniffed up into the nostrils three or four times a day being brought out of the mouth.

**F. S. R. S. C.**—Take a cold bath every morning, and get plenty of active outdoor exercise during the day. Keep the bowels freely open by means of a three-grain aloes pill taken every other night, followed by a colditz in the morning. Eat lean meat, boiled fish or fowl, very little bread or potato, plenty of green vegetables, no puddings of butter or suet, and very little sweet fruit. Take the following medicine: Sulphate of magnesia two drachms, carbonate of magnesia two drachms, peppermint water to six ounces. One-sixth part three times a day.

**MRS. POOLE.**—We are quite unable to tell you the treatment until we know the kind of disease. Skin diseases are very numerous, and the same remedy will certainly not be identical for all. You had better see some good medical man on the subject, inasmuch as the mere application of a medicament may be the least important point of all. We mean that internal medicine and sundry regulations in diet may have to be prescribed.

**ZILLAH.**—The best treatment for these is to keep the bowels very clear, and that not by taking internal aperients, but by using frequent large injections of warm water into the lower bowel: say a quart or even more at a time. After this has been done thoroughly every day for a week, then you may begin by taking small doses of Epsom salts or fruit salts every morning before breakfast. Be very careful to use plenty of soap and water to the face frequently during the day, and squeeze out any visible blackheads. You must refrain from beer and spirits, also much hot strong tea, sweets, fat things, and made-up dishes generally. Plain living, such as boiled fish or fowl, ordinary roast and boiled meat is the best. Not too much bread or potatoes, but any amount of green food. You may take five drops of Fowler's solution thrice daily immediately after meals.

**R. W. L.**—We must know the exact condition of the parts before treating them satisfactorily. If eczema is the malady, then beer and your employment in an iron foundry are absolutely the worst things for you, but we are unable to suggest anything definite. You had better take the advice with regard to diet that we have given to "Zillah" in these columns, as well as the medicine. With regard to the emptying of the bowels, that must be duly attended to also, but whether in the same way or not, we cannot advise because you have said nothing about the matter. Anyhow, you can try this treatment and watch the effect.

**835.**—We are very pleased to hear we have done you so much good, and thank you for the kindly expression of good wishes and gratitude mentioned in your letter.

## Easily Taken Up.

Cod Liver Oil as it appears in Scott's Emulsion is easily taken up by the system. In no other form can so much fat-food be assimilated without injury to the organs of digestion.

## Scott's Emulsion

of Cod Liver Oil with Hypophosphites has come to be an article of every day use, a prompt and infallible cure for Colds, Coughs, Throat troubles, and a positive builder of flesh.

Prepared by Scott & Bowne, Ltd., London.

Sold by all Chemists and Vendors of Medicine at 2/6 and 4/6.

# "MALT-COFFEE"

(PATENTED.)

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Does not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much farther than any ordinary coffee; therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin.

MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

"The Family Doctor is a Popular Periodical, and contains many useful Notes."—Morning Post.

## EYESIGHT PRESERVED.

# MR. AITCHISON, OCULIST OPTICIAN,

SHOULD BE CONSULTED BY ALL PERSONS SUFFERING FROM DEFECTIVE EYESIGHT.

**NEARLY ALL DEFECTS OF VISION CAN BE CORRECTED BY MEANS OF PROPERLY ADAPTED SPECTACLES AND EYE-GLASSES.**

THE FAMILY DOCTOR AND PEOPLE'S MEDICAL ADVISER, October 14th, 1893, page 101, column 3, says:—"It is impossible for sufferers to know, without skilled aid, the glasses that will correct Defective Eyesight. MR. AITCHISON'S SYSTEM OF SIGHT-TESTING is the Most Perfect in Existence, for he has studied the subject in all and every detail."

ALL PERSONS SUFFERING FROM DEFECTIVE EYESIGHT SHOULD CONSULT MR. AITCHISON.

A personal visit is, of course, most desirable, but those who cannot, by reason of distance or infirmity, call at—

**47, FLEET STREET, or 6, POULTRY, LONDON, E.C.,**

SHOULD WRITE FOR INFORMATION.

Mr. Aitchison's System of Sight-Testing by Post is a very satisfactory one, and it is far better to give it a trial than to buy Spectacles of unskilled Traders, who know nothing of Optical matters.

*The following are some Letters which have been received from Persons who have been Suited by Post, without an Interview.*

From GALWAY, IRELAND. Mr. Thos. Healy writes:—"I am glad to say that the Spectacles I have received from you give me *entire satisfaction*. I doubt whether you have ever met with any sight so weak as mine at my age."

From GUERNSEY, CHANNEL ISLANDS. Mr. F. M. Wade writes:—"I have received the pair of Spectacles; I can see distinctly with them, and in every respect I am *highly satisfied* with them."

From BRIDGWATER. Mr. A. Leversha writes:—"After two years' use of the Spectacles which you supplied me through the post, I write to say that I am now able to go without spectacles, the benefit I have obtained from those you sent have been so great. I may mention that before applying to you I was treated at the Bristol Eye Infirmary and the Taunton Eye Infirmary, with no good result."

**GIVE MR. AITCHISON'S SYSTEM A TRIAL.**—Write and explain the defect you complain of, as well as you can, and your letter will receive careful attention, without any charge whatever.

ALL LETTERS TO BE ADDRESSED:

NOTE.—Any person who has been supplied with Spectacles by Post can have a Personal Consultation if they should at any time come to London, and any Alteration required will be made in the Spectacles without charge.

POSTAL  
DEPARTMENT.

**MR. AITCHISON,  
OCULIST OPTICIAN,  
47, FLEET STREET, LONDON, E.C.**

**YELLOW S.**—The technical name of the conditions described is "chronic bronchial catarrh" with addition, probably, of pleurodynia—secondary to indigestion. We should advise you not to pay too much attention to phenological prognostications, nor to worry yourself, quite needlessly, about approaching paralysis. Use the terebene, and see to the indigestion by cautious dietary, with an occasional morning dose of our good old friend, Epsom salts.

**T. A. LLEWELLYN.**—The pain is partly the result of the second cause mentioned—partly lumbago. Avoid the excess; keep clear of damp in all forms both internally and externally. Apply half a mustard leaf on successive nights to the right and left sides of the part, moistening the leaf first, and keeping it in contact with the skin for from twenty to thirty minutes. Take one teaspoonful of sulphate of soda in a wineglassful of water each night and morning, and should there be any obstinacy, write us again.

**F. T.**—1. Yes; it is probably another abscess, and you had better have the decayed tooth extracted without delay. 2. The only plan of helping to reduce the superabundance would be by massage, systematically applied by a trained masseur for a period of three or four months.

**S. G.**—The history of your case is very curious, and in face of the conflicting opinions of several medical men, it is impossible to cut the gordian knot without seeing you. It would be better that you should have a reliable opinion once for all, than waste your time, energy, and money in consulting a multitude of doctors who do not appear to understand your case. You would, therefore, be wise in determining to consult a London specialist. Advise you yourself know of a reliable man, place yourself in communication with us again and we will put you on the right track.

**F. HOBBS.**—You must not imagine that the causes for falling out of the hair are purely local. You seem to be labouring under that delusion, as apparently you have not undergone any general treatment. Give up the absurd applications you have been using. Use some Lanolin pomade to keep the scalp soft, and take the following pill with each meal: Reduced iron of three grains, extract of nuxvomica one quarter grain, pill of colocynth and henbane one grain. This should be continued for six weeks.

**LAURA JONES.**—Your case is one of simple coryza, with the ordinary additions. Your feeble health is not a result, but a predisposing cause for the attacks. Take, therefore, the pill prescribed for "F. Hobbs," and during the illness use four or five times a day (when indoors) an inhalation of steam to which a few drops of Friar's balsam have been added.

**USELESS DOCTORS.**—Thank you for your very complimentary references to our journal. We are glad you are pleased with our efforts to accomplish what is often, under the circumstances, a task of some little difficulty. There is probably some ulceration of the cervix uteri, which will need to be cauterized before you can expect it to heal. You cannot, of course, do that yourself. Meanwhile, let the patient use twice a day a hot injection containing a teaspoonful each of powdered boracic and tannic acids to each pint of water. Give also a teaspoonful of compound liquorice powder each night at bedtime.

**MERCHAN.**—At ten and a half years we should expect a boy to be quite free from such a filthy habit. It is not due to general bad health in this case, and be certainly does not require tonics of any kind whatever. Combined with the stupidity described, we are not sure whether it would not be wise to take him to a physician in the habit of treating mental cases. You might see what taking him to the closet at stated hours will do. Say at 8.30 a.m., 1 p.m., 4 p.m., and 7.30 p.m.

**ALEX.**—Not all the soaps ever made would cure a condition dependent entirely upon internal causes. You have not mentioned your age, but we take it that you are somewhere about twenty years old. Give up stimulants, coffee, sugar, preserved foods, and tobacco. Drink only after, not during, meals. Take the following medicine a quarter of an hour before each meal: Dilute hydrochloric acid ten minims, sulphate of magnesia half a drachm, spirit of chloroform five minims, infusion of gentian to half an ounce. Use only hot water for washing the face, and rub the neck well with the towel after drying. Press out all blackheads and mature spots after piercing with a spear-pointed needle.

**LIVER.**—Money spent on any of the appliances named would be thrown away. The habits alluded to in your letter are probably accountable for most of the consequences named, and, as you say, you might take medicines until Doomsday without the slightest relief. You need local electrolytic treatment. See reply to "S. G." in these columns.

**H. M.**—Persevere with the mixture, taking it, however, four instead of three times a day. Be careful that the bowels act freely, and avoid anything like unusual exercise.

**NEMO.**—Irregular menstruation is at the bottom of these troubles. You do not say whether you are pale or flushed, whether your general health is good or otherwise, whether your occupation, if any, is healthy, and whether your habits, appetite, or bowels are regular. If you will send us full details on reading this, we will do all we can to help you. Meanwhile, take one and half teaspoonful of Epsom salts each morning in a small wineglassful of hot water.

**G.E.**—You do not say whether you have ever indulged in stimulants to any extent. That is a common cause for such trembling as you describe. Occasionally excessive smoking will do it. You had better abandon both habits. Take the following mixture regularly for a month and then report to us: Bromide of ammonium twenty grains, tincture of henbane half a drachm, tincture of nuxvomica five minims, camphor water to half an ounce. Three times a day before meals.

**ALICE.**—You have quite forgotten to tell us how old you are, whether you are married or single, what your occupation, whether exposed to dry heat from gas, &c., whether your general health is good, whether you have recently or formerly had any fever or other special cause for the trouble, whether your appetite is good, whether you are constipated and otherwise regular. When you have sent us these particulars, we shall be able to form an opinion as to the cause of the falling off of your hair. We shall then be happy to give you a prescription for treatment.

**A FAMILY.**—The chemists who told you that there were no such preparations as Bipalatinoids or Carbonate of Iron talked nonsense, and exhibited their ignorance of a well-known method of medication. Write to the makers, Messrs. Oppenheimer, Son, & Co., 14, Worship Street, E.C., mentioning the names of the chemists to them. They will at once enlighten the ignorance of the drug retailers whom you consulted, and probably send you a retail price list of the preparations.

**TABLECLOTH.**—We are very glad to hear you are so much better, and think you cannot do better than go on with the medicine as before. You may take the liquorice powder quite freely; it will not do you any harm at all. The nervousness, &c., will all go off as you get stronger, and we think you are very wise in making up your mind to go in for gymnastics. Continue with the cold bath and other outlines of treatment which we formerly planned for you. It is quite safe for you to take Fellow's syrup if you wish, and Easton's syrup is also very good.

**HARROGATE.**—1. Yes. By all means sleep with your window open. The temperature in winter should be about fifty degrees Fahrenheit. 2. Yes. Certainly. The grated water would be better than the other.

**PHILISTINE.**—It is quite possible that the bromide may be responsible for the spots on your face, therefore it would be better to discontinue it, at any rate, for a little while. The usual cause for this nocturnal trouble is sleeping on the back, therefore you must guard against this as much as possible by trying something hard and large in contact with the back, so that when you have a tendency to lie on it the pressure of this object will wake you. The bowels must be kept freely open, and only very light diet indulged in, such as boiled fish and fowl, green vegetables, &c. Take a teaspoonful of Parrish's Food three times a day after meals, or some Easton's syrup twice a day after meals. If this does no good you had better see some good doctor about yourself.

**AN INQUIRER.**—It may or may not be eczema, but we are afraid we cannot tell you definitely without seeing the spots. They are very likely dependent in some way on your digestion. You must, therefore, look to your diet for the cause. Take plenty of active out-door exercise, and keep your bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bed-time, and followed the next morning by a mild dose of aperient fruit salts. Avoid beer, wine, and spirits, and much hot tea. Take the following medicine: Bicarbonate of potassium two drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces; one-sixth part three times a day.

**CRUSHED.**—This is all mental. But surely there is a physical get-at-able cause for all this. What is the reason you are so miserable and unhappy? Is there anything the matter with you? Tell us something about your occupation, habits, past history, &c., &c.; perhaps we may be able to achieve a revolution in your moral outlook.

**GENEVEVE.**—The best thing to do is to let her see a medical man on the matter, as there may be some physical malady at the bottom of this business. This habit is common enough in children, but at the age of twenty-six one does not expect it. You do not say whether this complaint came on in childhood and has continued ever since, or whether it is a more or less recent affair. If the latter, then we have very little doubt that there is some local cause for it. Under any circumstances a medical man should be consulted.

**THE GREEK.**—There is no particular diet for this sort of thing it is more a question of local cleanliness than anything. You had better get some washing, or bath-gloves, and rub the face with soap and water energetically, so as to clear out the obstructed glands. Do this three or four times a day. Keep the bowels freely open and avoid excess of sugar, fats, greasy things, &c.

**SWEET WILLIAM.**—This ought to be completely cured before you entertain the idea of matrimony, or it may come on much worse afterwards. The best thing you can do is to continue the treatment as before, until the whole thing disappears. Wear a suspensory bandage and keep the bowels freely open. Avoid beer and spirits, as heretofore, also refrain from taking much exercise, as this latter has a distinct tendency to aggravate the evil. It will, of course, cease, under either this treatment or some other. If it should not do so under the treatment we have suggested, you had better see some good medical man, who can examine you to investigate any cause that may require further treatment. Under ordinary circumstances the treatment should prove permanently efficacious.

**GREY WHISKERS, &c.**

To Permanently Restore the COLOUR in two hours,  
True to Nature, send for a bottle of

**COURTICE'S CONCENTRATED  
EXTRACT OF NUT  
GALLS.**

This is not a dye, is applied in two minutes, and does not stain the skin. Of all Chemists, or direct from GEO. COURTICE, 234, Strand, London. Post paid, 3s. 6d. To LADIES the EXTRACT is INVALUABLE for Restoring the Colour close to the skin, and can be used with any other restorer. Try it.

"The FAMILY DOCTOR combines an unusual variety of Hints on General Medical Subjects."—Lloyds.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scurfs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

## EDITORIALS.

**POULTICES.**—One of the inconveniences of poultices is their drying and sticking to sensitive surfaces or to parts upon which short hairs grow. This may to a great degree be obviated by first putting oil or vaseline upon the surface of the skin or of the poultice; and both the drying and the cooling may be hindered by placing over the poultice a piece of oiled silk or gutter-percha tissue, and over it again some cotton batting, the whole to be kept in place by a bandage or the like. The older method of making poultices covered on one surface only with cloth favoured this sticking, but the open-textured kinds of poultice cloth mentioned may cover both surfaces of the poultice mass, one lying between the latter and the skin. A temporary substitute may be found in a thick piece of cotton batting, or, still better, absorbent cotton, dipped in hot water, pressed partly dry, and applied and treated, as to covers, as advised for a poultice.

**THE MIMICRY OF NATURE.**—Curious resemblances in Nature start with the coconut, in many respects like the human skull and almost a fac-simile of the monkey's. The meat of the English walnut is almost a copy of the human brain, plum and black cherries like the human eye, almonds like the human nose, and an opened oyster and shell a perfect likeness of the human ear. The shape of a man's body may be traced in the mammoth squash, the open hand in growing scrub willows and celery, the human heart in German turnips and egg plant, and dozens of the mechanical inventions of the present day to patterns furnished by Nature. Thus the hog suggested the plough, the butterfly the door hinge, the frog stool the umbrella, the duck the ship, and the fungus growth on trees the bracket.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 9d., and in cases containing 6 times the quantity 11s. each, of all chemists. Sent for 3s or 12s stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.

A CHILD should never be laid down with its ears bent away from its head, as the result will be a deformity.

**COW'S MILK FOR INFANTS.**—The query is sometimes raised whether clear cream or part cream and part water is best for very young children. A mixture of good milk and lime water is found to be very good, one part of lime water to two parts of milk. The lime water prevents the milk from forming large curds in the stomach. But be sure that the milk is pure and healthy.

WE often forget, says the *Vegetarian*, that life consists of much more than growth. Development is just as essential a mark of life as is growth. What is the difference between a man and a child? It is not growth only. A man is not merely a child grown bigger. He should be a child developed as well as grown. Organs exist in the child as in the man, but in the child some of them are as yet useless; not useless because they want to grow larger, but because they want to grow better—i.e., to develop. A man may have ceased to grow bigger, but so long as he continues to develop his vitality still exists. When he ceases to develop, his life's horizon is in view, and degeneration has commenced. Degeneration ends in death.

**THE CLOVE.**—Cloves are the unopened flower of a small evergreen tree that resembles in appearance the laurel of the bay. It is a native of the Malacca or Spice Islands, but has been carried to all warmer parts of the world, and it is now cultivated in the tropical regions of America. The flowers are small in size, and grow in large numbers in clusters to the very end of the branches. The cloves we use are the flowers gathered before they are opened and whilst they are still green. After being gathered they are smoked by a wood fire, and then dried in the sun. Each clove consists of two parts of a round head, which are the four petals or leaves of the flower rolled up, enclosing a number of small stalks or filaments; the other part of the cloves is terminated with four points, and is, in fact, the flower-cup of the unripe seed vessel. All these parts may be distinctly seen if a few cloves are soaked for a short time in hot water, when the leaves of the flower soften and readily unroll. Both the taste and the smell of cloves depend on the quantity of oil they contain. Sometimes the oil is separated from the cloves before they are sold, and the odour and taste in consequence much weakened by such unfair proceedings.

IN Paris a very useful and timely notice has been posted in the omnibuses, informing travellers that expectoration is forbidden. How women, says the *Pull Mall Gazette*, would rejoice if the London General and Road Car companies were to confer a like boon on their patronesses! Great as the nuisance has become in France, it is quite as great in London. The cheapening of the fares has led to all sorts and conditions of people travelling by omnibus, and it is scarcely fair to give more licence to one class than to another. No decently-dressed woman dare travel in an omnibus without pulling her dress up above her boots. The nuisance is bad enough for women to contend against in the streets, but it is hard to think that, after escaping the dangers of the pavement, the same pitfalls have again to be guarded against in a public conveyance. Surely the authorities who look after cleanliness in omnibuses should not be behind their brethren in Paris in so necessary a reform of this kind. The ground upon which the French authorities have based their action is a sanitary one. They say that in this way cholera may be spread, and many medical experts appear to support that opinion. We commend the matter to the notice of Dr. Thorne and his department.

TO TOBACCONISTS (commencing).—*Illust. Guide*, 259 pages, "Post Free." How to Commence. £20 to £1000. Tobacco's Outfitting Co., 185, Euston Rd., London. Manager, Hy. Myers. Est. 1868. Smoke "Pick-Me-Up Cigarettes."

**THERAPEUTICS OF YAWNING.**—The practice of yawning is highly recommended by disciples of Delsarte as a healthful and improving exercise. In support of this theory it may be said that cats and dogs are persistent and all-embracing yawners, and are generally healthy. A cat yawns not only with her mouth, but with her head and four legs as well. One should yawn slowly, says the Delsartean, and with the best possible breathing, thus refreshing the muscles of head, throat, and, indeed, of the entire body. If not naturally disposed to yawning, the following recipe may be of use: Droop the eyelids as if sleepy, at the same time rolling the eyeballs slightly upward, though without closing the eyes; repeat the movement some half-dozen times, and you will find yourself beginning to yawn. Another method, which is effectual in setting a roomful of people to practising this excellent diversion, has not the stamp of the Delsartean system, and is doubtless familiar to many: Hold a pair of scissors in your hand and, without calling attention to them, slowly open and close them again and again.

**THE MEDICINAL VALUE OF WATER.**—The human body is constantly undergoing tissue change. Worn-out particles are cast aside and eliminated from the system, while the new are ever being formed, from the inception of life to its close. Water has the power of increasing these tissue changes, which multiplies the waste products, but at the same time they are renewed by its agency, giving rise to increased appetite, which in turn provides fresh nutriment. Persons but little accustomed to drinking water are liable to have the waste products formed faster than they are removed. Any obstruction to the free working of natural laws at once produces disease, which, if once firmly seated, requires both time and money to cure. People accustomed to rise in the morning weak and languid will find the cause in the imperfect secretion of wastes, which many times may be remedied by drinking a full tumbler of water before retiring. This very materially assists in the process during the night, and leaves the tissues fresh and strong, ready for the active work of the day. Hot water is one of our best remedial agents. A hot bath on going to bed, even in the hot nights of summer, is a better reliever of insomnia than many drugs. Inflamed parts will subside under the continual poulticing of real hot water. Very hot water, as we all know, is a prompt checker of bleeding, and besides, if it is clean, as it should be, it aids in sterilising wounds.

## THE DREAM KISS.

AT the door of my heart, in my dreams,  
You knock'd, and I opened the door,  
And there in the starshine and beams  
Of the moon you were standing, asthore!  
Ay! we, whom the pitiless days  
Had sundered and driven apart,  
To wander in desolate ways,  
Met there at the door of my heart.

"Oh, welcome!" I whispered, "my dear!"  
And you said not a word as I spoke;  
But you smiled and a tremulous tear  
From under your long lashes broke.  
And oh, the full rose of your lips  
To my mouth, love, you lifted it up;  
Such honey the bee never sips  
As I drank from that exquisite cup.

Ah, me! that the merciless moon  
Should banish my bliss with its beams!  
I woke with the lark and was lorn  
Of the lips and the love of my dreams.  
And down through the desolate years  
I wander without you, asthore,  
And wait for your coming in tears  
And in hope at my heart's open door.

—P. J. Coleman.

**HAPPINESS.**—The best definition of happiness is that given by a French woman, who says it is a state of constant occupation for a desirable object, with a sense of continued progress. It is this condition which makes reformers the happiest people in the world.

[SPECIAL ARTICLE.]

## HOW SURGEONS AMPUTATE.

BY DR. GENTRY.

(See Frontispiece.)

## THE PAST.

BEFORE the introduction of anesthetics, chloroform and ether amputations were, perhaps, the most important operations in the domain of surgery, and those which surgeons were most frequently called upon to perform. This was so because amputations, more often than any others, are operations of necessity, leaving no choice between them and death. When a limb is crushed beyond recovery it must be removed. If its removal be left to Nature, death from blood-poisoning will be the fate of the patient. It has been aptly said that Nature is a good physician, but a poor surgeon.

In those days, too, amputation was necessary in many cases where our improved methods of treatment would justify us in attempting to save the limb. In spite of this, however, so much was the operation dreaded, and so dangerous was it to life (only less so than its omission), that it was generally put off till the last moment, when the injured limb was already becoming gangrenous. This dread, both on the patient's and surgeon's part, will be easily understood when we consider the methods in use, and the conditions under which the operation had to be performed.

Up to the middle of the seventeenth century the limb was cut straight through at the site selected for the amputation. The covering of the end of the bone by means of flaps of skin and muscle, fashioned from the healthy part of the limb was, so far as we know, first done in England, at Oxford, in 1679, by Lowdham. There is some evidence that a similar operation was known among the Byzantines before that time. Long after this, however, even up to the first half of the eighteenth century, no better method of arresting the bleeding was generally practised than by cauterising the raw surfaces with strong chemicals, or with red-hot irons. Some surgeons even preferred to make their incisions with red-hot knives. Later, of course, the formation of flaps and the ligation of bloodvessels became universal. The troubles of the patient in those days only began with the operation; the wound scarcely ever united, as surgeons say, *by first intention*. The surfaces fell apart, often the bone end was exposed, the process of healing was slow, painful, dangerous; and the stump often permanently tender and useless.

Then we must remember that the patient had to endure the agony of the operation without the aid of any anæsthetic. Every second that the operation lasted was torture to him; such torture as probably few of us can adequately imagine. Not the least part of this would be the horrible expectation of it. All this stimulated the surgeon to cultivate *expedition* as his chief virtue. Every dexterous knack or turn, which would enable him to perform the operation in the shortest possible time, was sedulously practised. Spectators stood around the operating table, watch in hand, and noted to a second the time that it took to complete the amputation.

The mortality after amputations was, of course, under all these circumstances, very great. Many died on the operating table from shock, sometimes even from fright. The loss of blood was often considerable, seriously reducing the vital powers of the patient. The many accidents of convalescence, the long, slow healing by suppuration, all tended to reduce his strength, and to increase the number of victims. No wonder that, in the days before chloroform and antiseptics, amputations were an opprobrium to the surgical art, and looked upon only as a *dernier resort* of a not very hopeful character.

## THE PRESENT.

And now let us enter the surgical depart-

ment of one of our great English hospitals\*, and see how an amputation is performed in the year 1893. The floor of the operating theatre is occupied by the surgeon and one or two of his assistants. All are clad in long white garments, fresh from a sterilising oven, and tied closely round the throat and wrists. A nurse moves silently to and fro, making deft and rapid preparation to receive the patient, who is being anæsthetised in an adjoining room. The auditorium, rising tier upon tier in a semi-circle around the central space, where stands the operating table, is occupied by rows of students, who, chatting to each other in low voices, create a subdued hum of conversation. The surgeon who is about to perform the operation, turning back his sleeves, proceeds very carefully to cleanse and disinfect his hands with some antiseptic fluid—generally a solution of carbolic acid or corrosive sublimate. Every fold and crevice of the skin, especially about the nails, where germ-holding particles of dirt might lurk, is industriously brushed and sluiced. Meanwhile the assistants, having previously disinfected their hands in like manner, are setting out the instruments which the surgeon will require. These are nowadays made as much as possible of bright metal, and in one piece. Those necessarily having joints can be easily taken to pieces, and all the corners so rounded off that no speck of dust may find a secure or hidden lodgment. In the case of unavoidably-complex instruments, boiling or exposure to dry heat is resorted to that they may be rendered absolutely *aseptic* (free from living germs or the spores of germs).

They are laid out by the assistants in definite order in shallow porcelain trays, containing a solution of carbolic acid or other disinfectant. These are placed on small tables by the side of the operating couch. They are presided over by a special assistant, whose duty it is to hand them to the surgeon as he requires them and calls for them. At the same time they are within reach of his arm, for it is often easier, in moments of need, to seize an instrument for himself than to recall and pronounce its name.

Presently all is ready, and if there is a little time to spare, the surgeon may explain to the students in a few succinct phrases the nature of the injury or disease of the limb, and the particular method by which he intends to remove it.

Now a noise is heard in the ante-room. There is a sudden stillness and hush amongst the students, and all eyes are turned expectantly upon the opening door. The patient, stretched completely unconscious upon a wheeled couch, attended by a chloroformist and a nurse, is pushed up to the side of the operating table, and quickly transferred to it. The limb is bared, and the surgeon and his assistants quietly move to their respective stations. The first thing to be done is to empty the member of its blood by driving it back into the body and preventing its return by means of a tight elastic band around the base of the limb. This is done either by simply elevating the limb, and stroking it downwards, or by rolling an elastic cord or bandage from the extremity towards the trunk, as shown in A in the illustration. This is called the bloodless method of operating, and was introduced by a German surgeon named Esmark. It is an incalculable boon in all operations on the limbs, saving the patient all but the slightest loss of blood, and enabling the surgeon to proceed with his work without any of the anxiety or obscurity which blood-flow causes.

The skin of the part about the site of the intended incisions is now thoroughly cleansed from every trace of grease and dirt by the plentiful use of soap and water, benzine, &c. If necessary it is carefully shaved. The knife, usually the first instrument required in all operations, is taken from its bath of carbolic, and handed by the assistant to the operator. The latter, deliberately and without hurry, makes the incisions along the lines of marked out flaps, carrying the edge of the knife straight to the bone. The flaps are turned back, the bone is cleared by a circular sweep of the knife, sawed through, and the severed limb carried on one side by the assistant, who has been mean-

while supporting it. The first part of the operation is done.

Now comes the most important part of the procedure. The surgeon takes a number of forceps and searches for and seizes the open mouths of the chief bloodvessels of the limb. His anatomical knowledge teaches him where to look for these. As no blood is issuing from them, they are, indeed, sometimes a little difficult to find. A ligature of carbolised silk or catgut is tied tightly round each, and the ends of the ligature cut off close to the knot. The elastic tourniquet compressing the base of the limb is then a little relaxed, so as to permit the circulation to recommence. If there should be any artery yet untied the jet of blood now betrays it, and it is instantly secured. Soon all bleeding ceases, and the flaps, finally bathed and cleansed, are brought together in exact coaptation. A small rubber drainage tube may or may not be inserted between them to convey to the surface the serous exudation which appears during the next twenty-four hours. The edges of the skin are united by means of silk, catgut, or wire sutures; the stump is enveloped in antiseptic wool, firmly bandaged to a splint, and the patient, by this time recovering consciousness, is wheeled away to the ward.

The operation may have occupied a quarter of an hour or twenty minutes. Probably, however, no one has timed it. A few minutes more or less is of no consequence compared with the careful and exact attention to every detail which may contribute to the rapid and painless healing of the stump.

The after progress of a modern amputation so conducted is blessed indeed compared with the many accidents and painful dressings, which were apt to retard convalescence in these cases not so many decades ago. If all germs have been successfully excluded from the wound, as they usually are, the first dressing may remain undisturbed for a week. When the stump is then exposed, it is often found completely healed. Except for the first few hours after the operation, there is often no pain, and only the briefest rise of temperature. Of course it is considerably later before the scar is sufficiently firm to allow of the application of an artificial limb.

## THE ILLUSTRATION.

The old barbarous simple method of cutting straight through skin and flesh and bone has been long abandoned. Surgeons now shape their incisions so as to form flaps, the raw surfaces and skin edges of which can be brought together. There is thus no open wound left, and an abundant fleshy cushion covers the divided end and the bone. These flaps may be formed in various ways. One of the simplest is shown by the heavy lines in F. The appearance of the stump when the flaps are brought together is shown in G. From one corner of the wound a drainage tube protrudes. This forms a pathway by which any serum and discharge which is formed during the first day after the operation may escape from the wound. If this discharge were to be pent up between the flaps, it would cause much pain, and might even become an abscess, and tear open the wound.

B shows another mode of forming a covering for the end of bone. The appearance of the flaps when cut is shown in C. Observe the open mouths of some bloodvessels in the short lower flap. The long upper flap is doubled round upon the lower one, and fixed in the position shown in D. E shows the healed stump.

Flaps are formed in a number of other ways, according to the place where the amputation is to be done. In the case of the hand and fingers, where it is of consequence to save every possible fraction of an inch, flaps are made in any irregular way the nature of the disease or injury may permit.

H, the knife used in larger amputations.

IN PLAIN ENGLISH.—Patient (to family physician).—In your absence, doctor, I was compelled to call in young Dr. Sawbones. He said that the clinical symptoms indicated chronic interstitial inflammation. What is that in plain English? Family Physician.—In plain English it means that Sawbones didn't know what was the matter with you.

\*The description, with slight modification, will apply equally well to any large hospital in Europe or America.

## EXERCISE.

By C. W. B.

ONE of the important items in the economy of human life is exercise, without which it is impossible to enjoy good health, so that it behoves everyone to bear this in mind, and not allow his system to become enervated from a culpable negligence of one of the first duties of life.

It is absolutely necessary that not a day should pass without taking open air exercise, and the more that is taken without fatiguing the body the better; a person in pretty robust health should have at least two hours' exercise every day.

Some persons are afraid of going out in wet weather; but as an invention supplies us with materials impervious to the rain, it is better even in such weather to be in the open air.

The most salutary exercise is horse riding; but as that is within the means of a comparative few, the majority must be content with the next best exercise—walking.

In taking a walk it is advisable that a person should have some object in view, even if it be to pluck a particular blade of grass, or a twig out of a hedge; for without a purpose, the mere walking of so many miles is liable to become tedious, and is certainly uninteresting.

All thoughts of a disagreeable or engrossing nature should be driven from the mind when walking, or the benefit of the exercise will be rendered nugatory, as the body sympathises with the mind, and when one is free the other should be so, too.

The most healthy as well as agreeable localities for walking are those that stand high, the air being purer and the ground drier.

The time for walking must, in a great measure, be regulated by a person's avocations; morning is, however, decidedly the best time, and any period before night is preferable to night itself.

Walking before breakfast has been canvassed pretty freely by the medical profession; some persons' constitutions, however, cannot bear fatigue until they have taken some nourishment, and, by way of experiment, a trial might be made of a glass of milk and a biscuit before going out for a walk; but should the feeling of lassitude, accompanied by a headache, come on during the day, it would be wiser to desist from persevering in what evidently does not agree with the constitution.

Of late years the inducements for taking exercise have become numerous. For sixpence or a shilling, the railway or steamboat will convey passengers many miles from London, where the delights of the country lanes and fields may be indulged in, and a day of real enjoyment provided without incurring any great outlay.

A celebrated pedestrian used to declare that no one knew what true happiness was until he felt in a position to walk thirty miles a day. His expression was that when he had completed his training, "his heart was so light that he felt as though he could jump over the moon"; but immediately when he relaxed into a gross and idle style of living, he felt a dullness and heaviness almost insupportable. Now, although it is not to be expected that we should put ourselves under the same rules and regimen as professional walkers, it is, nevertheless, evident that the principle is correct, and the more largely we practice it, the nearer we shall approach to perfect health.

A great recommendation in connection with exercise is that, the more we take the more we are able to take; the man who walks a mile to-day will be equal to a mile and a half to-morrow, two miles the next day, and so on.

One of the greatest mistakes is for a person to say as we frequently hear them, "Oh, I feel so tired and languid, that I cannot possibly stir out to-day!" whereas, if they were to make the attempt! they would find that feeling of lassitude wear off as they proceeded, and evidently feel so much refreshed as to con-

gratulate themselves on having made the effort.

This is to be said in favour of exercise, that, whereas thousands have died from the want of it, none have ever yet been killed from taking it.

Many persons exultingly exclaim, "What a fuss there is about this exercise; and yet look at me, how well and hearty I am, that seldom or ever take any!" And so they may, apparently, be up to a certain age, but see them a few years later, perhaps suffering from an incurable asthma, overloaded with a burden of fat, or undergoing some infliction as the just retribution for the neglect of exercise in their early days. What would they give now for the opportunity of carrying out a principle which they scoffed at then!

In conclusion, were I to pen volumes on this subject, I could not more clearly express my meaning than in these few words: Exercise is necessary to the human frame, and must be taken every day; and unless we do so we must be content to sacrifice not only our health, but even life itself.

## DIABETES MELLITUS IN BENGAL.

DR. BOLYE CHUNDER SEN contributes to the July number of the *Indian Medical Gazette* a very interesting paper on 'the great and increasing prevalence of diabetes mellitus among educated Bengalis. He shows that the malady is very much more common among Hindus than Mahomedans—in the proportion of about 50 to 1; that up-country Hindus are comparatively exempt from the disease; that the middle classes, who earn their livelihood by brain work, suffer in much higher proportion to numbers than the labouring classes, and that males are affected to a decidedly greater extent than females. He adduces some statistics, supplied by the Health Officer of Calcutta, in support of these statements. The figures fully confirm his propositions, all the more in that they err by defect, inasmuch as many deaths really due to diabetes are registered under the diseases—phthisis, carbuncle, pneumonia, gangrene, &c.—by which, though of diabetic origin, death was immediately caused. He compares the Calcutta figures with statistics referring to the mortality caused by diabetes in Paris, England, and Wales, and the United States in America, and shows that the Calcutta death-rates from this cause are higher than those of France, Britain, and America, while in each case there is a decided increase in the mortality due to diabetes in recent years. He claims that his tables conclusively prove, "that the disease is on the increase throughout the civilised world, and in Bengal to an extent unknown elsewhere." There can be no question that Dr. Sen's remarkable conclusion is lamentably true, and it is amply confirmed by experience in Calcutta practice. The number of cases met with among educated Bengalis is very considerable, and a great many valuable professional and official lives are yearly cut short by the wasting and exhaustion caused by diabetes or the complications which so frequently occur in its course, and are so apt to terminate fatally. Diabetic families are by no means uncommon, for the malady tends to become hereditary, one member after another succumbing to the multifarious phases of the disorder.

Dr. Sen attributes the large and increasing prevalence of diabetes among educated Bengalis to nervous dietetic influences. Among the former he considers infant marriage, as tending to nervous exhaustion and racial deterioration, to be a capital factor. He also points to the high educational pressure of the day and the growing struggle for existence among brain workers as tending materially to nervous waste and debility. Sexual excess is also mentioned as another cause of impairment of vital power. The diet of the classes which are subject to these compromising influences is shown to consist mainly of rice and vegetables, and is

sadly lacking in milk, meat, fish, dall, and atta, which supply elements necessary for the maintenance of health under strain, while no care is taken, by means of outdoor sports and games and regular exercise, to build up and sustain the physical strength. The excessive use of alcohol is also said to be a common and growing habit.

Dr. Sen distinguishes two main forms of diabetes—namely, the acute type affecting young subjects, and the chronic affection of the middle-aged and old. The former is practically beyond the control of treatment, prophylactic or curative, but life may be prolonged in the latter class by careful attention to diet, moderation of work, and other causes of nervous depression and waste, warm clothing, and attention to general and personal hygiene. Opium, or perhaps better, its alkaloid codeia, is the best medicine.

The more important question of prevention is discussed in a liberal and suggestive manner. Dr. Sen knows his country and caste men and their ways intimately, and is in a position to write with corresponding authority. He places most stress on the avoidance of infant marriage, and on relaxation of excessive educational strain. He counsels open-air exercise and the encouragement of gymnastics and games. On the subject of diet, the liberal use of milk for the young is strongly insisted on, and for the adult the larger admixture of nitrogenous articles, such as fish, meat, eggs, dall, and atta in the dietary is considered imperative. The "pernicious habit of drinking which has come into fashion" is very properly condemned in unsparring terms.

Dr. Sen has rendered a most important public service in bringing this subject to the front, and we hope that the serious facts to which he draws attention, and the weighty lessons which he inculcates, will give rise to thought and effort among his fellow countrymen and townsmen, to the end of adopting such domestic and social reforms as may tend to stay that course of constitutional deterioration of which the increase of diabetes is a certain sign.—*The British Medical Journal*.

## HOW TO STIMULATE THE LIVER.

OF what vast importance is this to the liver sufferer. The sluggishness of this member renders life a misery, and existence a burden. No energy, no desire to participate in the pleasures of life, and no anxiety to combat its trials: These are the feelings with which the unfortunate patient is possessed, and Englishmen seem particularly prone to this class of disorder. Why this is so we do not propose to discuss. Certain it is that it exists, and certain it is that it can be combated and defeated. But it requires a careful mode of living. Excess, whether of eating or drinking, must be studiously avoided. Digestive disturbances are nearly always associated with liver trouble, and must be dispelled by taking a tablespoonful of Oppenheimer's plain Cream of Malt daily with meals to assist the digestive functions. This will act by dissolving and aiding the assimilation of all starchy foods, which are usually the class of foods at fault. Nor must constipation, if it exists, be passed over on any account. Remove it at once by taking one or two laxative palatinoids at bedtime. But still these are only the complications usually associated with liver complaint. How to stimulate the liver gently and regularly is the question? Well, I know of no better drug for this purpose than Euonymin, and I know of no better method of administering this drug than Euonymin palatinoids, taken one three times a day after meals, and you will be surprised how wonderfully fresh and energetic you feel at your daily duties. That terrible languor and drowsiness will disappear like magic. But one word of advice, do not give it up the moment you feel better. Continue its use; the small amount taken of this harmless drug cannot possibly hurt you. Try it—you will thank me for the hint.

BIRDS of a feather flock together. The first grey hair will soon have companions, unless their coming be rendered impossible by the use of Mrs. S. A. Allen's World's Hair Restorer.

TOWLE'S PENNYROYAL AND STEEL PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 1d. and 2s. 6d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 15 or 24 stamps by the Maker F. T. Towle, Chemist Nottingham. Beware of imitations, injurious and worthless.

SATISFACTION GUARANTEED. Health, comfort, economy. Corsets made to order wear best. Distance no hindrance. Measurement-forms free. Every kind, lowest prices, best qualities made quickly by FORD & FARR, Corset Factory, 141, Stockwell Road, London, S.W. Estb. 1856. Try one. Please call for write.

"The FAMILY DOCTOR is a Popular Periodical, and contains many useful Notes."—*Morning Post*.

## LIVER COLIC.

**E**SPECIALLY prevalent at the age of forty or fifty, hepatic or liver colic manifests itself sometimes under the simple conditions of cramp in the stomach, with deposit in the urine, and sometimes under the more severe form of acute tearing pains situated in the right side of the abdomen, under the false ribs, the pain spreading to the right shoulder and back, a symptom suggesting the presence of gall stones. A common expression of acidity in the blood, allied to joint diseases such as gout and rheumatism, the gall stone varies from the size of a lentil to that of an egg, at times smooth and regular, often angular and rough, and one can easily conceive the difficulties to which it gives rise in its expulsion from the gall bladder.

An accumulation of gall stones, or hepatic concretions, is one of the commonest occurrences in gout. One always thinks, in this connection, of the case of Turgot, who was a martyr to gout all his life; at the autopsy, Vicq d'Agyr found in the gall-bladder more than sixty stones. The naturally thick consistence of bile, the extreme nervousness and tortiosity of the channels through which it flows, the extreme irritability of the mucous membrane of these channels are a ready cause for the frequency of these concretions. Excess of meat, fat things, saccharine matters, abuse of acids and alcoholic drinks favour their formation by retarding the flow and modifying the composition of bile. Glisson long ago observed that biliary calculi (gall-stones) are met with in sheep and oxen born in the winter, because they are deprived of fresh fodder and active exercise in the open air.

There sedentary life and muscular inactivity, also, explain the frequency of this complaint in prisoners and women. Among the latter, a lymphatic temperament, monotonous and confined living, prolonged slumber, absence of exercise after meals, continual sitting, tight corsets, and habitual constipation are the most probable causes of hepatic colic. Also, in women, it is especially necessary to mention the state of pregnancy, which involves profound modifications in glandular nutrition, a question not very clearly solved from a physiological point of view. Finally, it would be puerile to deny the determining action of moral causes on the liver, notably depression of spirits, habitual disagreements, &c. These moral causes probably act by producing a greater quantity of cholesterine from disintegration of nerve tissue. The expression "to make bile" is therefore true, speaking medically.

To treat a case of hepatic or liver colic, let the patient lie down, or, better, put him in a warm bath. Administer a subcutaneous injection of a sixth of a grain of morphia with a tenth of a grain of atropine, and give a rectal injection of a drachm of chloral. Let him have milk to drink diluted with two parts of some alkaline mineral water. After the crisis it is best to take a teaspoonful of Rochelle salt every morning in a bowl of broth or in green coffee. The following method, popular at New Orleans, may also be tried: to swallow, if possible, two large glasses of olive oil at an interval of a quarter of an hour; then lie down on the right side for two or three hours—eight or ten hours afterwards all the stones are evacuated. The absence of hepatic colic among the Spanish and Italians may perhaps be due to their daily use of olive oil as food.

When the subject is an habitual sufferer from gravel, the formation of the stones may be stopped by taking at each meal, simultaneously, a capsule of ether, one of essence of turpentine, and one of chloroform; twice a week, twenty or thirty grains of rhubarb; twice a week, a large injection of soap and water with a table-spoonful of borate of caffeine, or benzoate of soda, added to it. We must not forget, moreover, the beneficial results obtained by counter-irritation over the region of the liver, so much insisted upon by Dr. Paul Morol, of Vichy, in a recent remarkable work. Once a week painting with iodine, or some blistering with nitric acid, over the region of the liver will arouse the secretory activity of this organ and re-establish its functional activity.

The sedentary life should be superseded by one of open-air activity—fencing, riding on horseback, or cycle are most effective in attacking the liver. Carriage riding also supplies necessary abdominal succussion, which is good. Every year we see patients arriving to take the waters who are suffering from an attack of gall-stones, brought on by the jolting of the railway carriages, more especially if they are faultily suspended. Massage, continuous currents, cold water douche, and friction over the liver, are excellent therapeutical adjuvants. Now this is most important in reference to the dietetic régime. Four meals a day at regular intervals, consisting of meat, roast or boiled, spinach, lettuce, chicory, carrots, artichokes, watercress, celery, salad, endive, boiled potatoes or in broth, radishes, cabbages, cauliflowers, fruit (except oily fruit), well-cooked fish, soups will be best made with milk; the diet will be more vegetable than animal. Abstain almost completely from fat, yolks of eggs, shell-fish, oysters or mussels, sauces, spices, confectionery, *foie gras*, and cheese. The patient should also avoid tomatoes, asparagus, peas and beans, mushrooms or truffles, nuts, almonds, wines, liqueurs, gaseous or sugared drinks. He may drink in the morning white wine diluted with water, and in the evening, milk with a table-spoonful of lime water to the pint. Coffee, weak tea, and tobacco are allowable when these agents facilitate (which is generally the case) abdominal functions. Among the numerous table-waters recommended against biliary lithiasis, we give preference to warm alkaline waters, of which Vichy and Carlsbad are the most successful. We have frequently seen the hot-water cure fail, while the treatment by milk and grapes, which facilitate remarkably the functional activity of the digestive canal and its appendages, has succeeded by introducing into the circulation alkaline salts, which are so useful in neutralising acidity and relieving definitely the liver, that great vascular gland.

## "POISON."

By A YOUNG STUDENT.

**T**HERE is no more dread word in the language than this little six-letter one—Poison. The pronunciation of it gives an indescribably disagreeable feeling, and the sight of it makes one turn away his eyes. And yet I have never experienced anything horrible resulting from the taking of poison, by myself or friends; so I have come to attribute my aversion to an instinctive feeling. However that may be, I can but recognise the danger really existing to thousands of men, women, and children from a careless use and storage of things poisonous.

In many families there are bottles allowed to accumulate without labels; and poisonous medicines are permitted to mingle on the same shelf with harmless and often-resorted-to drugs and remedies. This carelessness should not be allowed another moment by the reader of these lines, if his own household happens to justify fall within the limits of my criticism—and the chances are it does. Everything of a poisonous nature should be most carefully and plainly marked in the first place, and then kept in such a locality as to be difficult of access, to say the least.

Few families have at hand a handbook such as should be accessible in every home—a book which gives in alphabetical order the names of poisons and their antidotes, "boiled down" to absolute brevity. There are many books on the market which are designed to fill the needs I refer to, but few, indeed, which are sold at a low figure, and which accomplish the object of quick reference in the best and most popular manner.

From a leading druggist I have procured quite a list of the "popular poisons," if I may be permitted to so term them, which I give below, together with their antidotes, for such benefits as the reader may find from the possession of it:—

**ACONITE TINCTURE.**—Antidote. — Emetics; stimulants, internal and external.

**ARSENIC (Arsenious Acid).** — Antidote. — Limewater in copious draughts; emetic of mustard or sulphate of zinc, flaxseed tea,

infusion of slippery elm, hydrated oxide of iron, or dialysed iron.

**ATROPIA.**—Antidote.—Emetic of mustard, or of alum, or of ten grains of sulphate of copper.

**BELLADONNA TINCTURE.**—Antidote.—Emetic of mustard or of ten grains sulphate of copper.

**CHLORAL HYDRATE.**—Antidote.—Stomach pump or emetic of mustard, cold effusion of head or spine, artificial respiration.

**CHLOROFORM.**—Antidote.—Fresh, pure air and artificial respiration. Hold the patient up by the heels.

**CORROSIVE SUBLIMATE.**—Antidote.—Emetic of mustard, or other safe emetic, if vomiting does not already exist. Both yolk and white of an egg mixed in water, administered in large quantities. Wheaten flour with milk.

**DIGITALIS TINCTURE.**—Antidote. — Take often strong coffee or tea without milk or sugar, lie flat; produce vomiting by a table-spoonful of mustard in warm water.

**LAUDANUM (Tincture of Opium).**—Antidote. —Strong emetic of mustard or other safe emetic, with stomach pump; dash cold water in the face; keep awake and in motion; strong coffee and artificial respiration.

**MORPHINE (Morphia).**—Antidote. — Strong emetic of mustard or other safe emetic, with stomach pump; dash cold water in the face; keep awake and in motion; strong coffee and artificial respiration.

**NUX VOMICA TINCTURE.**—Antidote.—Emetic of sulphate of zinc or mustard; relieve spasms with chloroform or ether.

**OIL OF PENNYROYAL.**—Antidote.—Emetic of mustard, or other safe emetic.

**OIL OF SALVIN.**—Antidote. — Emetic of mustard, or other safe emetic.

**OPIUM.**—Antidote.—Strong emetic of mustard or other safe emetic, with stomach pump; dash cold water in the face; keep awake and in motion; strong coffee and artificial respiration.

**PARIS GREEN (An arsenical preparation).**—Antidote. — Limewater in copious draughts; emetic of mustard or sulphate of zinc, flaxseed tea, infusion of slippery elm, hydrated oxide of iron, or dialysed iron.

**PHOSPHORUS.**—Antidote.—Emetic of mustard or other safe emetic, *crude* spirits turpentine; sulphate of copper should be given in dilute solution, three grains every five minutes until vomiting is induced.

**STRYCHNIA.**—Antidote.—Emetic of mustard or other safe emetic; relieve spasms with chloroform, ether, or opium; ten-grain doses chloral hydrate every fifteen minutes.

**TARTAR EMETIC.**—Antidote — Tannic acid, catechu, vegetable astringents.

The writer advises the reader to cut this out and keep it with his medicines where he can put his hand on it "in the dark," quite as readily as he does on the undesired poison.

## RECENT PATENTS.

*This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.*

19,000. Improvements in apparatus for treatment of the human body. C. SPRICK, jun., London. October 10th, 1893.

19,010. Improvements relating to the administration of medicines. C. SPRICK, jun., London. October 10th, 1893.

19,148. An improvement in brushes or other instruments for cleaning the teeth. G. E. HUBBARD, Leicester. October 12th, 1893.

19,158. A push-stem hypodermic syringe. J. W. DAILY and R. R. EVEREST, London. October 12th, 1893.

## SPECIFICATIONS PUBLISHED.

17,306. Street ambulance stations. TOZER and TIPPETTS (10d.), 1892.

"CRITICISM WILL FOSTER TALENT," is an adage too well known to need dilating upon, especially as it is necessary to speak of something which for many years has defied adverse criticism. Holloway's Pills and Ointment, as sterling remedies for all complaints, are more familiar than "household words," being in constant daily use by thousands of people, who look upon their possession as a positive necessity. Leading medical authorities advise their use as reliable medicines in times of need. As a certain cure for all skin diseases they are unequalled, whilst for bile, sick headache, flatulency, indigestion, and all liver and stomach disorders, it has been truly said they are worth their weight in gold.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**ARELISHABLE DISH.**—All careful housekeepers experience more or less annoyance in the dressing of celery, as they realise that only about half of it is available for the table. The green portions with many of the leaves are so fresh and delicate looking that it seems a pity to throw them away, and except in soups or salads there is but little use for them. An excellent way of utilising this heretofore waste material is to wash it thoroughly, to cut in pieces about three-fourths of an inch long, and put it in a saucepan with a little water to boil, letting it simmer for an hour and a half or two hours, adding a pinch of salt. Let the water boil nearly out, then add a little cream, a small piece of butter, and a little flour or cornstarch wet with water. The cornstarch is much more delicate, although some people seem to prefer flour. When done, this should be like a thick batter. Slices of toast may be prepared, and the hot celery put upon them, a large spoonful to a slice. A tiny bit of butter, and the least possible dash of pepper may be added; then send to the table and serve immediately.

**DEVILLED CRABS.**—Mix two cans of crabs, one cupful of cream, two tablespoonfuls of melted butter, two large tablespoonfuls of Worcestershire sauce, pepper, salt, nutmeg, the yolks of three hard-boiled eggs, one-half cupful of bread crumbs, and one glassful of sherry. Bake in shells covered with bread crumbs and dotted with butter.

**RABBITS AND ONION.**—Joint and stew in salted water. Boil one pint of sliced onions in salted water, add to white sauce made of one tablespoonful of braided flour and one-half pint of rabbit stock. Season, add juice of one lemon, and serve.

**STRONG CORDIAL.**—A cordial for the weak, who are not teetotalers, may be made as follows:—Add a pint of good wine to a quart of barley gruel, boil it down to one third, and add lemon peel or any seasoning the invalid prefers.

**STRENGTHENING JELLY.**—A strengthening jelly can be made by boiling two calves' feet in a quart of water and a quart of new milk, baked in close-covered jar four hours. When cold remove the fat. It may be flavoured with lemon peel, cinnamon, or wine, and sweetened to taste, or with Bovril.

**STEAMED SPONGE PUDDING.**—One cup of bread sponge, one teaspoonful of butter. Mix thoroughly and set to rise in a warm place. When very light, roll thin and spread fresh or canned fruit of any kind, or jam, jelly, or raisins; or dried cherries are very good also. Roll it into a little loaf, put on a buttered tin, or a small basin, and set in a warm place until light. Steamed one and a quarter hours. Keep closely covered. Serve with whipped cream, or any good sauce.

**SALTED ALMONDS** remain a popular confection. While upon the subject, it is well to recall the fact that there are many varieties of almond. The paper-shell is the most expensive, but it is not, by any means, the best-flavoured nut of this species. From the very thinness of its shell it is apt to be dry and hard. It is only valuable when served on the table with raisins, in the old-time way. For all other purposes the hard-shell Jordan almond is far better. To prepare salted almonds for the table, blanch them by throwing boiling water over them, and then, after they have stood two minutes, putting them in cold water and rubbing the brown skin off with the hand or a rough little cloth. When the almonds are all blanched and dried with a cloth, measure them. Sprinkle a tablespoonful of olive oil over every cupful of nuts. Let them stand two hours. Sprinkle a tablespoonful of salt over each cupful, mixing it in thoroughly with a spoon. Spread them out on a bright tin pan and place them in a

quick oven, where they will turn a delicate brown and become crisp and tender in from ten to fifteen minutes. They should be stirred every five minutes. They should be served on the daintiest little silver openwork dish that you possess, or on a pretty bouillon dish of rare porcelain. They take a place on the table as an ornamental *hors d'œuvre*, and remain from the beginning of the meal till the end.

### VIENNA COFFEE.

Into an ordinary coffee-pot  
Pour on your coffee water bubbling hot.  
Cover it closely. Boil it for one minute,  
Simmer it five. Take your milk boiler, in it  
Put one pint of sweet cream, and don't omit  
To keep the water boiling under it.  
The white of one egg beat and beat, and when  
A stiff froth forms, like crusted snowdrifts, then  
Add, of cold milk, three tablespoonfuls. See  
If cream is scalding; when it proves to be,  
Remove from fire, add white of egg and milk,  
Stir briskly till 'tis smooth and fine as silk,  
Then serve to use with coffee. 'Tis the way  
The Viennese folk serve café au lait.

—F. E. Pratt.

## HINTS FOR THE HOUSEHOLD.

**THE KITCHEN SCHEDULE.**—Housekeepers troubled with forgetful servants can reduce their cares considerably by making out a schedule of the work to be done each day of the week, and placing it in the kitchen, where it can be seen by the maid who presides over the household work. The duties of the week, if apportioned to certain days, will make work easier to mistress and maid, and if these days and duties are put down in black and white in view of the kitchen goddess, they will impress themselves more readily upon her mind, and leave no excuse for the forgettings which servant girls are so addicted to. A constant bugbear of the kitchen is the maid who "forgets" that there is no sugar, or butter, or coffee just at the moment when dinner is ready to be served. There is nothing more exasperating than this phase of domestic annoyance.

**HARD putty** may be easily softened by passing a red-hot flat piece of iron over it, so that it can then be removed with the fingers, or the edge of a knife.

To remove odours from a sick room, it is a good plan to sprinkle coarse ground coffee on a shovelful of burning coals, and thrust it into all the corners of the room.

SOMEBODY has said that a diet of oatmeal and brown bread tends to promote the growth of the hair. However this may be, the diet is a good one for many more assured reasons.

Two uses for eggs are not generally known or appreciated. A fresh egg beaten and thickened with sugar, freely eaten, will relieve hoarseness, and the skin of a boiled egg, wet and applied to a boil, will draw out the soreness.

**RIPE apples** would be a very wholesome substitute for the sweetmeats that children devour, and can easily develop as exacting a taste as children now have for candy.

**SILVER or steel thimbles** are the only kinds ever to be used. Other compositions, of which cheap thimbles are made, are very frequently of lead or pewter, and their use is likely to result in serious inflammation and swelling if there is even a slight scratch on the finger.

**RESTORING COLOUR IN LINEN.**—Colours taken out of linens by careless washing or otherwise may be restored by immersing the articles in a solution of one part of acetic acid to twelve parts of water.

**BEDROOM FURNISHINGS.**—In furnishing a bedroom we must remember that we have to do with the lungs of the house and, therefore, must place no obstructions to the entrance of pure fresh air. For this reason curtains may be more properly dispensed with in this room than in any other. The bedstead should be of metal. Very pretty ones are now made of iron enamelled in different colours, with gilt or brass

knobs. The most restful colour for the eyes and brain is green. The curtains, if they can be afforded, should be of the Japanese crepe, which is daintiness itself in this colouring. Besides the bedstead a small chiffonier and a deep chest of drawers, with two chairs, are all that will be required, but a washstand and screen to stand before it are desirable additions. Above the chest of drawers a long, narrow mirror can be hung crossways, and you have a serviceable combination of a bureau and dressing-table. It is better judgment to invest in comfortable springs, mattress, pillows, and blankets than to fritter money away on painted cologne bottles and elaborate toilet sets. The coverings of chiffonier, bureau, washstand and bed should be easily laundered, for absolute cleanliness is one of the conditions of restful sleep.

**A REVIVAL OF LACE.**—There has been a marked revival of late in the wearing of real lace, an article that at one time had scarcely any sale. Now women are bringing out to the light their treasures of Honiton and point and Valenciennes, which have been long laid away in the hope of just such a demand.

**TO REMOVE INK SPOTS.**—To extract ink from cotton, silk, or woollen goods dip the spots in spirits of turpentine, and let them remain so for several hours; then rub thoroughly between the hands, and they will all disappear without changing either the colour or texture of the fabric.

**SAUCES AND CONDIMENTS.**—The abundance of sauces and condiments in these days would lead one to suppose that they are the outcome of a purely modern demand. As a matter of fact, their inception reverts to a period far distant. In France, during the reign of Louis XII., there was created, for the manufacture of sauces, a company, which obtained from the King the exclusive privilege to concoct them. The makers were obliged by law to name the ingredients of which their compounds were made. By this means the component parts of the famous Sauce à la Cameline were revealed. It was composed of "good ginger, good cinnamon, good grains of paradise, good bread and good vinegar." Sauce Tence, which enjoyed an equal reputation, was made of "good sound almonds, good ginger, good verjuice, and good wine."

## CURING A COLD.

**THE** season of colds being at hand, the instructions of an eminent physician may be found valuable: When the first symptoms manifest themselves is the time for action, and this should consist of a hot mustard foot-bath before going to bed and a hot draught of milk. The covering of the body should be linen and wool, the former in the way of the sheet and the latter in the blanket. No attempt to get up an active sweating should be made. The foot-bath and the warm drink will give a sense of warmth and facilitate the natural excretion of materials which should pass away by the skin, and any effort to aggravate this will be not only superfluous, but harmful. The blanket should never be worn next to the night robe, and should not be so thick as to confine the air next to the body. It is, indeed, often advisable to lighten the covering of the feet, and to preserve a certain amount of weight over the loins, and to have the shoulders protected from the external surroundings in general. The last measure is not to be underrated. A sensitive lung carries with it susceptibility to take to itself everything that could possibly affect it to its detriment. Lung diseases belong to sensitive persons, and may or may not be the sequence of a cold. The majority of them, however, can be traced to imprudence in dress and exposure.

"IT IS WORTH KNOWING" if you have a cough that the quickest and simplest—let alone the cheapness of the remedy—is KEATING'S COUGH LOZENGES. One alone relieves cough, asthma, and bronchitis. As a cough remedy they are simply unrivalled. Sold everywhere in tins, 134d. each; free for stamps. Thomas Keating, Chemist, London.—[ADVT.]

**EAT IN COMFORT.**—Indigestion prevented by the use of DUNN'S FRUIT SALT, &c., which require but little digestive effort. 6d and 1s. tins. Ask your grocer. Large sample in blue stamps.—W. G. DUNN & CO., WORKS, CROYDON.

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—Daily Chronicle.

# THE MOTHER'S PAGE.

## INDIGESTION IN YOUNG CHILDREN.

### TREATMENT.

**O**CCASIONAL indigestion in small infants should receive very simple treatment. Usually Nature administers all that is necessary, producing vomiting. If, however, after the stomach is emptied, the child remains languid, and apparently nauseated, the trouble may be relieved by administering, in teaspoonful doses, a mixture of limewater and milk, equal parts. A mustard draft may be applied to the stomach at the same time. If the bowels are affected, as will be evidenced by the bloated condition of the same, with or without pain, and with or without diarrhoea, a teaspoonful of castor oil is indicated. If three or four drops of paregoric be added to this, the griping attendant upon the use of the castor oil will be avoided.

Occasional indigestion in older children is a far more serious matter. It is usually attended with a high temperature. Convulsions are not uncommon, and, being always more or less dangerous, should be avoided by every means possible. As in the former case, the first object to be accomplished is to rid the digestive organs of the offending material. If the child were old enough, vomiting would best be induced by administering large drafts of warm water; but this can seldom be accomplished; the same end may be attained by a dose of syrup of ipecac, or, better still and more sure, pulverised alum in molasses. The proportions to be used do not matter, as a teaspoonful of the mixture is almost always sure to induce vomiting. If it does not, the same dose repeated fifteen minutes later certainly will. As soon as the stomach is settled so that it can retain what is put into it, a purgative dose of syrup of rhubarb should be administered. If the fever continue, and the purgative fail to act, after three or four hours an enema should be given to hasten the result desired. A bath at 95 or 98 deg. temperature is always good unless the child struggles too hard against it. Pain in the abdomen may be relieved by fomentations or a poultice.

When the fever is high, and marked nervous symptoms are present, indicating that there is danger of convulsions, the above suggestive measures—vomiting, purging, and the warm bath—should be used promptly and energetically, for there is no time to lose. If the twitching of the muscles and other nervous symptoms continue, a physician should be sent for at once.

Habitual or chronic indigestion of both infants and older children is treated in much the same way. First and foremost should attention be given to the diet in all its details; next to this, regard to proper exercise, exposure to fresh air, and proper clothing.

If the patient be a nursing infant, inquire into the condition of the nurse, regulate her diet, &c., and if, upon examination, her milk proves to be inefficient in any way, a change of nurse will probably be all that is necessary. In artificial feeding, milk ought always to form the basis of food. We have often found, in cases where it was supposed cow's milk could not be taken, that it could be digested if properly weakened. A child a few months old should take it half in half, or two-thirds milk and one-third water. Gradually increase the quantity of milk until the child is one year old, when in most cases it may take it clear, although at that age we have often found children who could not take care of the casein of cow's milk, and it needs to be weakened in some way, either with pure water, barley-gruel, or oatmeal-water. If it is proven that milk cannot be taken, try sterilised sweet cream, but it should be used in the proportion of one-third or one-fourth cream to two-thirds or three-fourths water. If this fails to give perfect satisfaction, the following preparation is very highly recommended by one of long and large experience.

**STEEDMAN'S Soothing Powders** for Children cutting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve a healthy state of the constitution during the period of teething. Manufactured only at Walsworth, Surrey. Sold everywhere at 2s. 6d. per box.

It is made of prepared gelatine or Russian isinglass, cow's milk, cream, and a very thin arrowroot water properly sweetened. Twenty grains of isinglass, or a portion of the isinglass cake two inches square, is soaked for a short time in cold water. The water is then boiled till the gelatine is fully dissolved, about fifteen minutes. A small teaspoonful of arrowroot is mixed into a paste with a little water, after which the milk is added, and allowed to boil for a few minutes. At the end of the boiling the cream is added. The proportions of milk are, for very young children, one-third or one-half; for older infants, one-half or two-thirds; of cream, two tablespoonfuls added to the pint if the mixture is one-third milk. When one-half milk, one tablespoonful and a half of cream to the pint is the proper quantity. Sweeten with sugar of milk. The diet for older children is as important as that for infants. Grave results,—life-long happiness and usefulness—often depend upon the proper feeding of children during the first five years of life.

In selecting food, care should be taken that the same should be both easy of digestion and very nutritious. The morning meal may consist of mush and milk, or well-prepared bread and milk. Right here let me say that sour bread is one of the worst things that can be put into a child's stomach. If the least bit tainted, it should never be used in feeding children. To avoid the danger it is best to use unleavened bread. Cream breakfast rolls or bread toast well dried through in the oven may be crumbed into the cream. For dinner, some soup made with rice, or well-prepared vegetable soup, is very good. This can be eaten with the bread stuffs before recommended. Rice may be taken very well; but all sweet-meats, vegetables, and nearly all fruits should be prohibited.

A wet compress over the stomach and bowels worn at night, will aid in the recovery. In order that this should be effectual, however, it should not be allowed to get cold. To avoid this danger, cover the compress, which will consist of two thicknesses of cotton, with oiled muslin or a piece of rubber sheeting, and cover the whole well with flannel, and bind about the body snugly.

Tonic treatment, consisting of general massage, electricity, and salt baths, will be found of inestimable value.

## WOMEN'S MANNERS.

WOMEN'S manners are, and long have been, the subject of much discussion. It has been said that women usurp the rights of others, intrude on the time of other people without conscience; that by thoughtlessness and indifference they detract much from the peace of life, and add irritation to friction. One popular writer accuses women of presuming on their sex in their relations with men, especially in business, and assert that they are spiteful to others. He sums up their offences under the following heads:—

"First.—The indifference with which a woman will contemplate the fact that the convenience of others has been sacrificed to her caprice. Very observable in young women.

"Second.—The needless delay a woman often causes in making her appearance when visitors have called upon her. Most commonly noticed among women who are no longer classed as girls.

"Third.—The unwillingness of a woman to wait for another to finish speaking before beginning to speak herself. Characteristic of nearly all women.

"Fourth.—Woman's failure to recognise the importance of an engagement. Most noticeable among women who have the fewest social duties.

"What I do insist upon, however, is this: that in the public the average woman shows an inconsiderateness, a disregard for the ordinary courtesies of existence (which amounts some-

times to positive insolence), to a degree which is not anywhere nearly approached by the average man."

There is a degree of truth in what this writer says; it is true of some women—of women enough to detract from the comfort of the whole. But rudeness, spitefulness, indifference to engagements, an impetuosity of ideas that demands, or seems to demand, relief, are not sins monopolised by women; they share them with their brethren. The average woman, like the average man, represents the average intelligence and culture of our people. It is not the exceptional man or woman who is representative. The manners that prevail represent the popular conception of what is good.

A NEWBORN babe should be fed every two hours when awake during the day. As to the night, it is our opinion that it should not be fed more than once between 10 p.m. and 6 a.m. The interval should be gradually lengthened, until, at the age of one month, it should not be less than every three hours in the day. At this time, or very soon after, the midnight meal can be dispensed with, with profit to the child. Each meal during the first ten days should consist of from two to three tablespoonfuls. From this time on, if the child is vigorous, his powers of assimilation will rapidly increase. At the age of one month he ought to take from a pint and a half to two pints in the twenty-four hours.

BOTH taste and chemical analysis show that human milk is much sweeter than that of the cow. As the Creator never does anything to no purpose, we would naturally conclude that the additional sugar had some office to perform in the nutrition of the body of the child. Experience proves this to be true. Whenever it is possible to obtain it, sugar of milk should be used, and not the ordinary cane or grape sugar. Concerning the quantity necessary, analysis shows that in order to approximate the proportions in human milk, when the dilution used for the child consists of two-thirds water and one-third milk, six and one-half drachms of sugar of milk are necessary to each pint. When the proportion consists of half milk and half water, five and one-half drachms are needed. When ordinary sugar is used, not more than half the quantity is necessary; but this should not be used unless it is impossible to obtain the other.

OUR usual method of making mustard plasters for infants has been to use about half mustard and half flour, wetting the same with the white of an egg. When prepared in this way we have never known it to produce a blister, although it makes the surface very red.

## ONE MORE WORD TO MOTHERS.

REMEMBER that the baby feels the cold as much or more than you do yourself, especially if he is not old enough to run about. Do not let him sit on the floor cold and wet, unless you wish to do him irreparable harm. Do not forget to put on his flannel shirts and under-drawers early. It is presumed he has been wearing flannel shirts all the summer. Remember that the little feet need to be protected with warm woollen stockings. The amount of clothing actually required depends upon the constitution of the individual. Some need twice as much as others. The amount required for health can best be determined by the temperature of the limbs, and the colour of the face and hands after a cold morning walk.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE L. N. COLN AND MIDLAND COUNTIES DRUG COMPANY, LONDON.

Mrs S. A. Allen's World's Hair Restorer is not a temporary expedient, but a permanent restorer. The hair is changed to its natural colour and has all the luxuriance of youth.

[SPECIAL ARTICLE.]

**SHOULD COUSINS MARRY?**

FROM A MEDICAL POINT OF VIEW.

By "H.," M.D.

SECOND ARTICLE.

THIS question is on a level with many others in being of deep interest to our race, but unlike vast numbers that engage our attention, the issue is of practical importance, and vitally strikes at the welfare of a large number of families. The subject may be approached from three sides, the *social*, the *religious*, and the *medical aspect*. It is my intention to invite you to consider with me the last mentioned view, but before doing so we will casually glance at the other two. The *social aspect* practically resolves itself into one of expediency and desirability. The *religious view* of the question as put forth in the Book of Common Prayer is decidedly embarrassing—to the book itself—half-cousins may not marry, cousins may; was ever a greater absurdity propounded? And it brings to mind the idea, so well inculcated by our best historians, that many of our ancient laws were made to subserve the purposes of the ruling classes, in preserving their lands and monies, and were not based on justice, equity, or wisdom. And there can be little doubt that the origin of the absurd doctrine in the Common Prayer-book was born out of the exigencies of those who framed this particular law, or their masters.

We will now pass on to the *medical aspect*, which is by far the most important, inasmuch as the other two are bound up in it, or, at least, they ought to be, because, if it is proven to be a breach of Nature's laws that cousins should marry, then no religious dogma or social cant ought to overstep the limit, for universal experience proves that the person breaking Nature's laws suffers for his temerity. An excellent *résumé* was published in these columns a short time ago of the views of many observers, and it is unnecessary I should enter that field again, but I will try and bring home to you the answer from your own daily observations.

Many writers in dealing with this question seem to have confused the *heredity of disease*, with the *results of consanguinity*. I will give you an example, and this instance will also bring home to you the difficulty of apportioning the real cause of the result observed, besides showing you how unthinking observers have erred.

Mr. and Mrs. P.—, living in a healthy country place, the husband a carpenter (it is of necessity that I am vague in my description of actual living examples, lest I cause pain to the afflicted), are cousins, and have several children; now all the children suffer from some degree of angular curvature of the spine. On examination, the mother proves to be a strong upright person, but the father, who, although he is vigorous in his movements, is certainly weak in the back, and his spinal column shows more decided curvature than it normally should do. Now it is an admitted fact that heredity plays a part in transmitting from parent to child angular curvature of the spinal column, but it is also a fact that if the children are brought up under healthy conditions the disease may be quiescent, and not show itself. Now how much can be accurately apportioned to the one cause or the other, how much is due to heredity, and how much to consanguinity in the case of these children? I could quote another family with precisely the same conditions obtaining the same results, but enumeration of such cases would land us with no definite issue. It is much better to go to the comparative physiology for our proof, the reason being that so many factors have to be taken into account in the highly organised human being, that it is difficult, as has already been said, to arrive at any result; but if one of the lower coarser organisms—such as a horse, cat, or dog, be taken, and the conditions of life be approximated, and grave results follow from too close mating, then we can very properly and logically infer, that if these things happen

in a coarser system than man's, how much greater will be the effort on the human economy where the system is so highly organised that very little puts it out of order?

Furthermore, this is one of those points on which the "lower animals," as they are sometimes called, are on virtual equality with ourselves, inasmuch as they are born, reproduce their species, and die and any breach of natural law affects them just the same, but to a lesser degree, on account of their coarser organisms.

Take the case of horse-breeding, and if you consult any experienced breeder, he will tell you, he would no more think of mating animals in which the same blood flowed, if the degree of relationship was not removed at least seven degrees, than he would of trying to get a donkey filly from a mare. He would regard the policy as suicidal, yet it is well-known that the skill and patience spent on racehorse breeding is absolutely unequalled. If a breeder wishes to produce a colt with, say, better quarters than the mare possesses, he will choose a stallion with the desired qualities well-marked. *The involution process is equal to that of evolution*; if you wish to produce defects mate those creatures showing the defects, and in-breed, and you will quickly get it. Now it is an evident truth that the *family likeness* which we see on the human face of relations, tells a great truth, inasmuch as it represents the degree to which Nature has moulded to the same type the relations, and *not only does this apply to the face, but to the mind and conformation of the body*. Now if you intensify the good qualities, you also intensify the bad, and herein lies the whole mischief.

Every school-boy who keeps and breeds pet rabbits will tell you that unless he buys unrelated bucks and does, and mates constantly from unrelated animals, the results are disastrous, the skin becomes coarse, the defects apparent, and the parents are guilty of killing their offspring.

In short, breeders of any kind of stock, will tell you, without hesitation, that *inbreeding* produces poor stock, liable to disease, and frequently unnatural to their offspring.

Now if these results accrue and are apparent in the coarse bodies of animals, say, in two generations inbred, it is a fair inference that the first generation shared the defect up to a certain point, and so what must be the result in the more complex unstable nervous system of man.

The truth is that if cousins marry, and they are very dissimilar in constitution, and sound, their offspring may be up to the average, and this is probably due to the good quality of the blood introduced from widely dissimilar marriages of the parents of the cousins.

But there can be little doubt that if one of the parents (cousins) suffers from a tendency to epilepsy, neuralgia, or the like, you almost invariably get one child mentally afflicted. "King's evil" was no doubt, so named from the constant *marriages de convenienc*e contracted by the nobility, and showing itself in strumous offspring.

The disease and death-roll of our continental sovereigns is very interesting from this point of view, and there can be little doubt in the mind of anyone who has studied it, that empires have been kept in throes of agony by the supreme head exhibiting such unstable qualities begotten from inter-marriage.

It is extremely difficult to place one's fingers on the precise defects that follow from cousins marrying, but suffice to say, that *the parents' defects are intensified in the children, and that the highest organs suffer first*, and that, therefore, the nervous system is the one in which we should first look for defects. Observers state that one of the prime reasons that the North American Indians have so dwindled in numbers is their constant inter-marriage, and since they have been confined to treaty limits, the opportunities for contracting marriages outside their numbers are reduced to a minimum, and that, although their conditions of life are bettered, as far as food supply and better domiciles are concerned, disease has been rife, and the death-rate extreme. The same is true of the Maoris, and the bushmen of Australia.

The following fact quickly becomes evident to any inquirer on this subject, that in inter-

marrying the defects are far more *en evidence* than the possible advantages. Mate pigeons or rabbits, the most easy tests in this relationship, and you will assuredly find that the fur, or feathers, of the offspring becomes rough and coarse, that the animals are not up to the standard of their parents in liveliness, and they exhibit unnatural tendencies to their offspring. This test has been applied over and over again with the results more or less evident in all cases.

Let us hope the time is not far distant when the higher standard of education we are seeking amongst our masses shall, to some extent, be obtained, that such marriages as these shall no longer be allowed, and that the Church will withdraw her sanction from what has been found physiologically bad for the offspring, and through the offspring tends to lower the standard of the vitality of our race. To summarise, at best cousins marrying is a bad policy, and only such should be allowed to do so whose parents are healthy and totally unrelated, and the cousins should have resided in different parts of the country, and be above the average in health. The slightest tendency, especially mental, to weakness is sure to be begotten and intensified. Lastly, let me urge for consideration that profound piece of reasoning and studious accumulation of facts, "The Origin of Species," by the late Charles Darwin. Lunacy authorities pronounce against it, and experience amongst breeders of animals points the finger of warning.

The history of nations affords many illustrations, and if you wish for further proof make inquiries amongst such of your acquaintances as have inter-married, and if there be children you will seldom find them up to the average, taken as a sample of the fruit of unmixed marriages.

**A CAT WITH FALSE TEETH.**

FEAT OF A YOUNG DENTIST WHO HAD A KIND HEART.

THE cat that owned the false teeth had lost his own, and had his jaw broken beside by a drunken wretch who beat him with a cobble stone. With great care the poor animal finally recovered, says *Harper's Young People*, but he had to be fed with a little milk in a spoon for a long time. When able to pursue his ordinary business of catching rats and mice, he could not eat them, because he had no teeth to chew with. Something must be done for him, for life supported on "spoon vittles" was a burden, and a young dentist in the neighbourhood, who had become greatly interested in the unfortunate cat, resolved to try the experiment of making him a set of false teeth.

Taking the cast of the plate was a terrible piece of work, as Captain objected to it with all his might, but it was nothing to what followed when the teeth were fairly in. If the animal had plunged and scratched while the plate was being fitted, he acted like a mad thing when it was firmly attached to his jaw—although it was well made, and fitted perfectly. He could not understand that it would enable him to continue the luxurious feasts to which he had been accustomed, and for several days he was furious over it. Every possible and impossible scheme was tried to get the uncomfortable thing out of his mouth; he tore at it with his claws, he shook his head violently to make it drop out, he butted against heavy pieces of furniture, and if anyone came near him he growled and scratched at them.

There seemed to be danger of his going mad, and his friends were sorely puzzled to know what to do with him, when, greatly to their relief, he calmed down, and appeared to have come to the conclusion that his new possession was, after all, a blessing in disguise. He was once more gentle and affectionate, as he had been previous to his misfortune; and the plate was now often taken out between meals and put back again. In this way it was worn comfortably for over a year.

The accurate final rights of man lie in the far depths of the Ideal. Every noble work is at first impossible.—*Carlyle*.

"The FAMILY DOCTOR combines an unusual variety of Hints on General Medical Subjects."—*Lloyds*.

[SPECIAL ARTICLE.]

# CARE OF THE HEAD AND HAIR AND THE PREVENTION OF BALDNESS.

(Continued from page 138).

AS the hair is usually confined during the day, it should have freedom with the least possible restraint during the night. The best authorities advise a careful brushing for five or ten minutes previous to retiring, gathering it in a loose braid. It should not remain tightly twisted and fastened with hair-pins during the night, not only on account of the breakage likely to ensue, but that the strain upon the scalp may be relieved and the circulation promoted. The rubbing of the scalp both night and morning is an aid to the use of the brush, in promoting the circulation and a healthy condition.

Dandruff is probably the most prevalent affection of the scalp, as well as a source of annoyance. It should be borne in mind that dandruff pertains to the scalp and not to the hair, except as it becomes mingled with it. The most natural method of removing it is with the comb and brush, but the comb should be carefully used. Part the hair, and an operator will soon acquire the faculty of lifting the scales without scattering them through the hair. When this has been done the brush will remove the stray particles.

If there is great dryness of the hair, an oily lotion is a necessity, but it should never be used in excess. Such an one is furnished by an eminent medical authority as follows:—

Tincture of cantharides, three ounces; oil of rosemary, one ounce; bay rum, six ounces; olive oil, one ounce. If there are symptoms of greyness, break up one ounce of rock sulphur, but do not powder it, and place this in the lotion. Working under a hot artificial light is a cause of baldness, and general debility of the system often manifests itself through the falling of the hair almost before it is realised otherwise. Contagious affections of the scalp are also more numerous than is suspected, though men are more likely, through barbers' shops, to suffer from them.

Many times the brush, properly used, will give the needed vitality and vigour to the healthy scalp. There are cases, however, when some application seems a necessity, either to furnish nourishment through the scalp to the hair, to modify its normal condition, or to change the colour. There are many objections to oils and pomades, since they not only soil the head and clog the pores, but in the case of vegetable oils, give to the hair stickiness and an unpleasant odour. One of the simplest applications is a quinine wash made with bay rum to which small quantities of oil of rosemary and cantharides have been added. The amount of oil to be used may be varied at pleasure, or it may be omitted altogether when other tonics or washes are being used. The effect of this simple application is to strengthen the growth and darken the colour of the air. Sometimes in cases of greyness it will restore the colour. Another method of treating heads that are heavily coated with dandruff is to wash them thoroughly once in two or three weeks with the egg mixture above mentioned, applying once in three or four days a borax and camphor wash. It may be made of two ounces of borax and one ounce of camphor, both powdered and dissolved in two quarts of boiling water; the proportion of borax and camphor is not imperative, and may be varied if thought best. It should be rubbed into the scalp with the fingers or a sponge, after which the hair should be rinsed with soft warm water and perfectly dried. A somewhat stronger stimulant comes from the use of a little ammonia or weak tincture of cantharides, while some authorities recommend rubbing the scalp with a raw onion, to be followed by an application of honey, and, of course, a thorough rinsing with soft water. Where the hair is harsh and untractable, a favourite application is the white of an egg beaten to a froth, and thoroughly rubbed into the roots of the hair. This should be allowed

to remain for some time, when it must be carefully removed by rinsing the hair in a mixture of equal parts of bay rum and water. In Germany this treatment is varied by using the beaten yolk of an egg. A wash to be used once a month or so is composed of half a teacupful of ammonia, a tablespoonful each of oil of bergamot and white castile soap, a teaspoonful of powdered borax, and a quart of rain water. This should be thoroughly mixed and kept in a covered jar. A variation in the list of tonics is made by taking tincture of cantharides, two drachms; castor oil, one ounce; bay rum, half a pint. Instead of the bay rum, alcohol made fragrant with a few drops each of the oils of bergamot, orange flowers, and bitter almonds is allowable. It is to be used every day or two unless it irritates the scalp, and should be rubbed in well with the ends of the fingers.

To prevent the tendency to falling of the hair, numerous preparations are in the market. Few of them are desirable, while some are dangerous. One of the best known of this class is made of bay rum, distilled extract of witch-hazel, common salt, hydrochloric acid, and magnesia. Another such, scarcely less well known, is composed of cayenne pepper, castor oil, bay rum, and alcohol. Among the youth of the previous generation, "Bear's grease" held a high place as a promoter of the growth of the hair. It may still be used, and at least is harmless. It is not necessary to buy the bottled and labelled article, with a high price, since its relation to any wild beast of the forest is very remote. The formula for its preparation is, one ounce of powdered gum benzoin to a pound of melted lard. Stir well together for five minutes, keeping it hot, then let settle. Pour off the clear, add a little perfume, and put in wide-mouthed bottles. Another dressing which is highly commended is made by the mixture of a gill of sweet oil with three ounces of lime water, well shaken together. It is frequently bottled and sold under very pretentious names.

Another very good application, both cleansing and stimulating, is made of cologne water and ammonia water, each one ounce; alcohol, half a pint; water, one pint. After using it is well to rinse the hair with warm water. Another shampoo mixture for home use consists of one pint of water, powdered castile soap, two table-spoonsful of alcohol, half the quantity of borax, and the yolk of two eggs. The eggs contain iron, which will be absorbed; the soap and borax will cleanse the skin, and the alcohol supply a sufficiency of heat to prevent cold.

Dyeing or changing the colour of the hair comes within a different field, and begins with the application of "restorers," most of which are merely stains or weak dyes under a less offensive name. Where anything of this kind is used, great care should be exercised and the effect upon the system, especially on the head, should be carefully watched. These dyes or stains are of two classes—those intended for darkening grey hair, and those for changing the natural shade to a more agreeable or fashionable colour. In regard to these preparations and their uses, we quote from a recognised authority: Pyrogalllic acid, water, and alcohol are the ingredients of one. Some hair may be made red or a reddish-yellow by a solution of pure rouge in a weak solution of crystallised carbonate of soda, followed, when dry, by lemon juice or vinegar to fix the colour. To change hair to a reddish-orange, there is sometimes used a solution of tartar emetic, acidulated by some vegetable acid, and the colour is fixed with neutral hydrosulphuret or the bisulphuret of ammonia. A few years ago many women with light air dyed the same to a golden hue, it being then the fashion. Doubtless some of them, at least, used a preparation the active ingredient of which was the bichloride of tin, the colour being fixed with the hydrosulphuret of ammonia. Where this is used on darker hair the same becomes a golden brown or auburn. In making the dark dyes some preparation of silver, the oxide or nitrate, is commonly used. The sulphate of iron, salt, wine, and nutgalls make up another dark dye. A dense black is obtained by using the following materials: First the sulphuret of potassium in water. After moistening the hair with that and allowing it to dry on, there should then be applied a solution of nitrate of silver and water. After a few hours' exposure to the light, hair so treated becomes very black.

But, as said in the beginning, there are very few people, comparatively, who care to resort to dyes. And it is better so, for many of those on sale are absolutely poisonous, while the balance of them, if they do not injure the general health, are at least hurtful to the hair. As for a "darkener"—something that will merely darken the hair without discolouring the skin—there might be a satisfaction to some people in using it. But no one should trifle with any preparation of the sort unless they know its ingredients, and have been assured by a physician or chemist that it contains nothing injurious. An eminent lady physician was wont to advise her patients, who would cover up the finger marks of age, to use the following to restore the colour of the hair turning grey: Rust of iron, one drachm; strong old ale, one pint; oil of rosemary, twelve drops. Put the mixture in a bottle, cork it loosely, shake it daily for ten or twelve minutes, then, after the mixture has settled, turn off the clear portion for use. Another prescription for the same purpose was as follows: Powdered sulphate of iron, one drachm; rectified spirit, one ounce; oil of rosemary, ten drops; pure rain water, one-half pint; shake until mixture is complete. While using either of these it would, of course, be necessary to keep the hair clean. Probably they would serve the purpose and stay, for a time, at least, the natural changes. Certainly these darkeners are practically innocent.

## CAN THERE BE RELIEF FROM THE MORPHINE HABITS?

By R. W. M.

YES; with persistent, well-directed efforts. We know of no drug so alluring in its work on the nervous system as morphine. While its effects are very pleasant, relieving the individual from intense pain, often it may not be otherwise regarded than a wonderful panacea in time of trouble; but it allures to destroy, and eases only to get a firmer grip upon the constitution. No one, as he begins the practice, would suspect the evil which it will bring later, and, as a rule, is only awakened to its baleful effects to find himself environed with disease, pain, evil forebodings, and mental depravity. It will take a most determined effort, with careful medical oversight often, to make headway towards a cure. The first necessary condition is for the individual to give up the drug and hypodermic syringe to someone who will take the responsibility of dealing it out, and one who will not be influenced by the remonstrances of the patient. We would recommend that if the individual had been taking ten grains a day, he cut it down to about four grains a day to start with. This would better be given in equal parts early in the morning, about noon, and just before going to bed. In the meantime the patient should take some exercise, with plenty of nourishing food, and with some tonic treatment, such as electric baths, fomentations to the spine, and occasionally a massage. After the individual has accustomed himself to that amount of morphine which will take two weeks and often more to accomplish, then we would recommend cutting down to one grain, divided up into three doses as before. In this stage the individual will need close watching that he does not obtain the drug in some other way, and it is in this stage also that he will need a good deal of moral suasion and encouragement. After two weeks we would recommend cutting off the remainder, and then comes the severest struggle still; but with perseverance and a firm helper, the system will soon learn to live without the drug. Let no one try the cure unless he is convinced that he is ready to make a desperate effort.

We have under treatment now a similar case who reports that he is standing the reduction very nicely under treatment, and is feeling very much better than he expected.

Some advocate confining the patient in a room so arranged that he cannot escape, and taking the drug entirely away from him. This places the patient on a very severe trial indeed, and we question the propriety of subjecting the nervous system to the necessary nervous strain to accomplish the object in that way.

"The FAMILY DOCTOR. Truly an Astonishing Pennyworth."—Knowledge.

## IS MARRIAGE BECOMING UNPOPULAR?

SOME people have been busy discussing the above question. It is not merely "the silly season" that brings such a question as this to the front: it is being discussed because of the social unrest that is so characteristic a feature of our time, and it is a symptom of that unrest. Women, it is said, have nowadays so many channels of employment open to them, so many different ways of gaining a livelihood, that they no longer look forward to matrimony as an essential part of life; while young men are reported to be fighting shy of marriage than ever, because of its costliness, and for various other reasons, more or less satisfactory. But it would be well to know precisely what we mean when we begin to discuss a question like that noted above. If it be answered in the affirmative, does the answer mean that the institution of marriage is becoming so unpopular that men and women—and especially the "wild women" of whom Mrs. Lynn Linton is never tired of writing—are associating together under some less binding, and therefore less permanent, obligation than marriage, or does it mean that the propagation of the human race is gradually coming to a standstill? So far as we can observe and learn, there is no cause for alarm lest we should have to adopt either of these unpleasant alternatives. Attention is now more fully called to the fact that women are able to make an independent living for themselves: that is all. Marriage seems to be really as popular as ever. Alike for the moral and for the physical health of the people, it is devoutly to be desired that the institution be kept sacred.

But if marriage is to remain the sacred and beneficent institution it has hitherto been, it is not much to ask that the woman who is at the head of the household should do her best to keep abreast of the times in all that concerns the comfort and the health and the consequent happiness of the home. And these essentials can be secured quite as fully in a humble dwelling as in a lordly castle. There can, of course, be no true comfort where there is not a sufficiency of food; but, in this country, if intemperance be not the thief, there are few homes, however humble, in which there may not be found at least an adequate provision of daily bread. Unduly early marriages are, indeed, to be earnestly depreciated, especially among the working classes. It is sad when the new-comer in the household meets with only a cold welcome, on the ground that there is "another mouth to be fed." But with ordinary prudence, and self-control, and temperance, there should always be in the home enough to satisfy modest wants. It is not enough, however, that the food be there; if it be not well-cooked it can never fulfil its proper function. And, therefore, it is needful that women should become intelligently acquainted with the most economical and the most effective methods of preparing nutritious food. Without this their husbands will not be kept in full health, and their children will not grow into strong, capable men and women. Much of the happiness of the household depends on the skill with which the wife manipulates the kitchen pot.

But another factor in the household comfort of hardly less importance is cleanliness and tidiness. There are, no doubt, men who will accustom themselves to almost any slovenly kind of preparation of meals, and to any amount of untidiness about the hearth. But, whether they will admit it or not, most men are repelled by a wife's carelessness in the matter of order, and by a generally unkempt condition in appearance and dress. The working man is not always able to secure perfect cleanliness in his own person; but when he gets home in the evening he likes to see tokens of the care and thought that have been spent in making the kitchen or "the room" attractive. When the wash-tub is supported on a

"THE LOVE OF HOME" is deeply rooted in the hearts of English women, and to make home cheerful and happy is their great desire. To attain this end, it is essential that pure and wholesome food and drink should be consumed. Above all, they should purchase the "BEST TEA." HORNIMAN'S TEA is "the Best," to buy.

couple of chairs, and potato peelings are scattered about the floor, or just within the hearth, and there has evidently been no effort to tidy up so as to welcome father's home-coming, it is little to be wondered at if he should seek the more attractive surroundings of the public-house, were everything done to secure his comfort for the time. In the dismal air of an untidy home marriage may, indeed, be often considered a failure. No doubt the poor wife, too, has her own trials, and it is too much the fashion to think only of the comforts of the brute of a husband. They must both contribute their share to the comfort of the home. And without tidy, comfortable homes, from which everything foul has been removed, we can hardly hope to have a truly healthy people.—*Sanitary Record*.

## APOPLEXY. CAUSATION AND TREATMENT.

WE are not sufficiently conscious of the charms of habit, for this characteristic gives to our different organs a kind of reserve force from which we derive benefit. The stomach digests, almost unhesitatingly, everything that is given to it, provided the material is not altered in composition and flavour; and the imperturbable stomach of lower animals, it is said, is derived from this constancy in the nature of their food. The lungs become accustomed to frequently respired air. Poisons even may, by habit, become more or less inert, and if our life hangs only by a thread, that thread may be considerably strengthened by habit.

Every change in age, place, season, and manner of living involves a danger of dying, which may be translated, and often is translated, by the term "apoplexy." Variations of temperature have so much influence that "apoplexy" becomes almost epidemic in spring-time and autumn, especially when a dry, hot summer succeeds a cold, wet winter, or where sudden and intense cold is succeeded by a mild autumn. Everything that disturbs our moral equilibrium—lively passions, concealed care, anger, excessive joy, everything that obstructs the normal current of the blood; tight clothes, constriction of the neck, excessive cold, driving the blood to the internal organs; high temperatures, hot baths, great respiratory efforts, everything that imposes increased call upon the digestive apparatus; indigestible food, strong waters, drunkenness, all these divergencies from our usual habits are causes of apoplexy. Further, every sudden breaking, even of a morbid habit, may produce the same result; the drying up of an ulcer, of a blister or burn, the interruption of a habitual flow of blood, suppression of a mucous discharge, omission of a blood-letting, of an application of leeches, of an emetic or a purge, contracted by habit, the rapid disappearance of gout, or a chronic eczema may involve the same dangers.

Is apoplexy hereditary? No; a fatal inheritance is no longer an article of belief. We inherit our constitution from our ancestors, but this is a sleeping capital, since it has no bearing on definite lesions to which the body may be subjected. Every descendant from an apoplectic ought to keep an eye on the functions of his skin, stomach, and intestines; he should avoid late hours, reading in bed, and should choose a profession that does not necessitate the bending of the head downwards or forwards.

Apoplexy is a rapid afflux of blood to the brain, a *congestion*. This blood, in abnormal quantity, may interfere with the cerebral functions by inflammation, or produce rupture of a vessel. In the latter case the blood is poured out and cerebral hemorrhage takes place. Most apoplectic states are preceded by symptoms of brain congestion—such as flushes of heat, deafness, fainting, sleepiness, exaggerated sensibility, headache, obtuse condition of the intellectual faculties, difficulty in the articulation of certain words, beating of the carotid arteries. We should then anticipate the attack, and endeavour to prevent it—hot foot-baths, leeches to the anus, purgatives, a light régime, and complete mental repose. If the attack takes place, in whatever way it happens, the following symptoms occur:—Somnolence

(more or less profound), sighing, paralysis of the tongue, (the point of which turns to the right or left,) twisting of the mouth, loss of sense and intelligence.

Often the patient who has lost consciousness revives more or less completely; but on the fifth or tenth day re-occurs the respiration which precedes death. The preservation of consciousness from the beginning is a most favourable sign, but even in such a case, symptoms of inflammation of the brain may supervene. Says an old physician, "In every apoplexy, beware of the eighth day!"

At the moment of the attack, remove all constricting clothes, place the patient on a bed, having the head raised by several pillows, and a little thrown back; if the face is red, place cold compresses on the temples and forehead. Leeches in the nostrils advantageously replace blood-letting, as they act promptly, removing much blood. It is important to ensure the repose of mind and body, to remove the invalid from the influence of light, from all external noise. Purgative injections have a good effect, and the food should be light and liquid.

After a fortnight or so the treatment commences with frictions, long continued, by means of soft brushes, soaked in stimulating solutions—like tincture of benzoin, camphorated spirit; douches and repeated movements excite the paralysed limbs. To avoid constipation, to be an abstainer from alcohol, to be interdicted from all intellectual and social occupation, these are the precautions to which the patient should be submitted for four or five months at least.

Our modern theories on the neuroses have only tended to throw a cloud on the true nature of apoplexy. Hysteria in the male, quite as frequent and very often as serious as that in the female, often stimulates the most characteristic symptoms of apoplexy and paralysis. Charcot has diligently studied hysteria in men. Often one has ascribed cerebral and spinal lesions to apoplexy, the symptoms of which have disappeared with a rapidity which is uncommon in such lesions. These paralytic phenomena of hysterical origin may even last and become permanent.

After all, let us not speak evil of apoplexy. It is the fatal lightning-stroke which painlessly snaps the web of our days, a death less cruel than when the threads are cut slowly one by one. We must not say, "happy those who die young," but "happy those who die suddenly!"

## PHARMACY—PAST AND PRESENT.

THERE is a growing tendency, says the *Lancet*, with the growth of knowledge, to over-estimate the present and to under-estimate the past. There is so much to learn in keeping fully abreast of modern research in every department of knowledge that the true value of earlier work is minimised. With a view to determine its real worth each new statement is scanned so eagerly that it is practically comparable to a minute object examined under a microscope, and the outcome is that it is talked about and written about under its magnified appearance until all sense of proportions in danger of being lost. On the other hand, the undoubted progress made in every branch of science almost inevitably discredits the labours of the earlier investigators, and the modern student is but too apt to look upon their work with his telescope reversed—to see it much smaller than it really is, and even perhaps to reduce it to such small proportions that it appears worthy of disregard. In no branch of science are these natural tendencies more fully shown than in the attitude generally assumed by the pharmacy of the present day towards the pharmacy of the past. Modern chemists and pharmacists must of necessity work whilst it is day and must be well primed with all the latest improvements, and there are many whose interest it is to deluge them daily with laudatory descriptions of the wonderful efficacy of the last new things, which are often new only in name. Granting all that can be said in favour of the present improved methods, of which we shall have to speak later, it is nevertheless only just to maintain an attitude of respectful, if not reverential,

consideration towards the past. The older workers were perhaps groping in darkness, but still they were at work. The methods of research may be now very different, but these methods are the results of the gradual evolution of the labours of numbers of past workers. The spirit actuating the past and the present is the same. It is the spirit of inquiry—the desire to attain knowledge, coupled with the earnest hope that by patient labour something may be done towards the alleviation of suffering and the prolongation of life.

## WAITING FOR THE PHYSICIAN.

### SECOND ARTICLE.

IN our article in the FAMILY DOCTOR of September 23rd we spoke of the many things which might be done while waiting for the physician, in cases of pain or in cases of fever. In this number we will write briefly of the many things that might be done in cases of accidents, of which cases we will first say a few words in reference to fractures or broken limbs. It is not expected that the laity will understand the methods of bone-setting; and wherever a physician can be obtained they certainly should not try, for very much of usefulness and happiness in after life depends upon soundness of the limbs. When a bone that has been fractured has been partially reduced, it is a very difficult matter for an expert to adapt it perfectly, and make a useful limb a month or two after a novice has made a failure. So let us take it for granted to begin with that it is always best to let the physician or surgeon take the responsibility of reducing fractures. But there are some things that can be done to great advantage in these cases while waiting for the physician.

In the first place, an injury of this kind always causes more or less swelling. This can be largely relieved by the use of compresses and fomentations. If the fracture is a compound fracture—in which case there is an external wound, and portions of the bone may protrude through the flesh—it should be wrapped in a clean cloth, and fomentations applied over the wrappings. If it is a simple fracture, with no outside wound, it would be best to apply the fomentations thoroughly over the limb, and after the fomentations, wrap it with a compress of cold water, or with some soothing lotion, and after some little time foment again. Also see that the patient is kept in as easy a position as possible, and do not stir or handle the seat of trouble more than is necessary. This course of treatment will relieve the patient of a good deal of suffering, and will facilitate matters very much when the surgeon comes to reduce the fracture.

The same course of treatment will also be applicable in cases of dislocation of the joints, which are often very painful. We have had occasion to reduce some dislocations the second or third week after the accident, and under some very unfavourable circumstances, on account of adhesions and the swelling. It certainly would have simplified matters very much if a thorough series of fomentations and compresses had been kept up from time to time since the accident.

### HÆMORRHAGES.

Hæmorrhages are also a common accident, and therefore a subject upon which it will be very proper to say a few words. They are of two kinds, arterial and venous. There are several ways to distinguish between the arterial and the venous hæmorrhage. The arterial hæmorrhage receives the rhythmic force of the heart's action, and therefore flows in jets. A bleeding from the veins does not receive this rhythmic force, and consequently flows steadily, and much less rapidly, from which cause we can see that the arterial hæmorrhage is of graver consequence than the venous one. Again, the arterial blood just coming from the lungs, where it has been aerated, is pure blood, and is of a bright red colour, while the blood of the veins has already done its work in the tissues, given up its oxygen, and taken up a certain amount of carbonic acid gas, which gives it a much darker colour.

But in the light of what may be done while

waiting for a physician, it matters little whether it is an arterial or a venous hæmorrhage. In either case, pressure, where it can be applied, is the best measure for stopping the hæmorrhage if it is severe. This can be done by tying a handkerchief or towel tightly round the limb on both sides of the hæmorrhage, requiring sometimes strong pressure. In case of arterial hæmorrhage, it would be well if every individual knew the location of the large blood vessels. Having this knowledge, they will have the advantage of being able to apply the pressure along the line of these vessels, which would be more efficacious than pressure applied in a general way.

If the hæmorrhage is small, resulting from a superficial wound, or from an old ulcer, some simple styptic would be all that would be required, as burnt alum powdered, a solution of iron, or, still more heroic and serviceable, the application of the hot iron.

All wounds, even before the bleeding is entirely stopped, should be protected with bandages wrapped tightly; or, better still, they can be bandaged by using what is known as the graduated compressed bandage. This is made by making a small compress which will fit into the wound. This should be made of five or six thicknesses of some clean material. Another compress a little larger is next made and placed upon it, and so on until there is a graduation of compresses extending above the surface of the wound. In this way the pressure of the external bandage will be applied directly in the wound. This will prove successful in nearly all cases of hæmorrhage from superficial wounds. After several hours a blood clot will have formed, so that the compress may be removed, or applied with less pressure, especially if it gives pain.

A wound on the head may usually be treated by a graduated compress or by styptics. A hæmorrhage of the lungs is of a much graver character, and often nothing can be done for its relief. The hæmorrhage, however, may be controlled in a measure by placing a cold compress or ice bag upon the chest in front, and a hot bag lower down on the spine. We would always recommend this in hæmorrhage from the lungs. In addition, if the hæmorrhage is copious, a teaspoonful of the fluid extract of ergot may be used. The individual should be kept as quiet as possible, and reclining, and the extremities should be kept warm. It has been found serviceable to ligate the limbs tightly in order to retain as much of the blood as possible in the trunk and nerve centres. This may be done by tying a towel around the limbs, and with a stick twisting it until a requisite amount of pressure is applied.

Bleeding from the nose is also a common occurrence, but rarely dangerous. Snuffing cold water up the nostrils will usually be quite sufficient to stop this bleeding. It is said that raising both hands up above the head, and holding them there for a short time, will usually control any severe hæmorrhage from the nose.

Another class of hæmorrhages is called internal hæmorrhage. This is bleeding into the intestinal canal, the abdominal cavity, or some of the other closed cavities of the body. This more often happens in cases of ulceration or cancer. Very little can be done, from the fact that the seat of the bleeding cannot usually be determined. A severe bleeding will cause a condition known as collapse, wherein the surface of the body becomes pale, the pulse very weak and thready, with a tendency to fainting, and perhaps a cold perspiration. Little more can be done in an emergency of this kind than to keep the body warm and dry by light rubbing. Insist upon extreme quiet, keep the head lower than the body, and administer one or more doses of ergot, as mentioned above. It would be well not only to take the pillows from under the head, but is a good plan also to raise the foot of the bed six or eight inches. If the individual lives through the hæmorrhage and revives, good nursing and careful feeding will be quite sufficient, and the patient will often improve rapidly. But he should ever keep in mind that after a hæmorrhage of that kind has once occurred, he is very liable to have another, and should be instructed to avoid all unnecessary strains.

A WISE man should have money in his head, but not in his heart.—*Swift*.

## HOW TO BREATHE PROPERLY.

MOST people breathe properly, often more by accident or instinct than by design; but, on the other hand, hundreds of thousands do not breathe properly, while many thousands at this present moment are suffering from more or less severe affections of the lungs or throat, owing to a faulty mode of respiration—in other words, because they breathe through their mouths instead of their nostrils. The mouth has its own functions to perform in connection with eating, drinking, and speaking; and the nostrils have theirs, viz., smelling and breathing. In summer time the error of respiring through the mouth is not so evident as in the winter season, when it is undoubtedly fraught with danger to the person who commits this mistake.

If anyone breathes through the natural channel, the nostrils, the air passing over the mucous membrane lining the various chambers of the nose becomes warmed to the temperature of the body before reaching the lungs; but if he takes in air between the lips and through the mouth, the cold air comes in contact with the delicate lining membranes of the throat and lungs, and gives rise to a local chill, frequently ending in inflammation. Many persons, without knowing the reason why they are benefited, wear respirators over their mouths in winter, if they happen to go out-of-doors. By doing this they diminish the amount of air which enters between the lips, and virtually compel themselves to breathe through the nostrils. But they could attain just the same result by keeping the lips closed, a habit which is easily acquired, and conduces to the proper and natural way of breathing. We believe that if people would only adopt this simple habit—in other words, if they would take for their rule in breathing, "Shut your mouth," there would be an immense diminution in two classes of affection, viz., those of the lungs and throat, which count many thousands of victims in this country in the course of a single year.

Man is the only animal which has acquired the pernicious and often fatal habit of breathing through the mouth. It commences in childhood, and becomes confirmed in adult life, often engendering consumption, chronic bronchitis, relaxed sore throat, or some other disease of the lungs or throat, which is set down, usually, to a different cause altogether. In concluding this short article, we venture to ask our readers to judge for themselves. When they step out in the morning into the fresh but cold air, let them try the difference of feeling arising from the two modes of breathing—through the nostrils and between the lips. In the former case they will find that they can breathe easily and freely, yet with comfort, while the fresh air, warmed to the temperature of the body by its contact with the nasal mucous membrane, is agreeable to the lungs; in the other case, if they draw in a few inspirations between the parted lips, the cold air, rushing in direct to the lungs, creates a feeling of coldness and discomfort, and an attack of coughing often comes on.

## OUR OPEN COLUMN.

### CORRESPONDENTS' OPINIONS.

#### MANLY TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.

SIR,—Some years ago, reading so much correspondence on tight-lacing, I was determined to give corset-wearing a genuine trial. The first difficulty was to order stays; they were, I thought, a strange article to ask for. After some hesitation, however, I went to an establishment at Brixton, and, on inquiry, was surprised to find that they sold nearly as many gentlemen's stays as ladies' corsets. In a few days I received my stays, and commenced lacing gradually, day by day, until I made them meet. I wore them closed for some time, and then ordered a smaller pair, which I soon wore closed. In conclusion, I will say, though belonging to the small-waisted brigade, I never suffer any ill-effects from my tight-lacing, but, on the contrary, quite enjoy the feeling of perfect compression.—Yours truly,

A CONSTANT STAY-WEARER.

## THE DEATH PENALTY.

AS long as the death penalty exists, the recent carrying it out by electrocution, in America, shows this process of ending life in obedience to the demands of the law to be the most certain, the most expeditious, and the least revolting of any which has yet been tried. But—and the question is becoming a serious one—is a State ever justified in taking life as a penalty for crime? If intended to prevent crime—and that is undoubtedly the strongest argument in its favour—why is it that experience shows that murders are more frequent after an execution? The minute details of all the steps of the crime brought out in the trial, and a record of almost every moment of the prisoner's life, from the time of sentence to death, creates and keeps alive a morbid feeling anything but healthy, and more likely to lead to crime than to deter from its commission. We must not forget that we are living in a different age, and are surrounded by different influences than that in which the doctrine of retaliation was proclaimed in "an eye for an eye, and life for life." The penalty of death is fast disappearing from European law, and yet, where it has been abolished, the result of the experiment shows in almost every State a lessening of capital crime.

The death penalty has been practically abolished in Italy since 1875. There has been no execution in Wallachia since 1828, and none in Moldavia since 1849. The last execution in Portugal was in 1846, and in Holland in 1861. In all but eight cantons in Switzerland executions have ceased. In Finland, Belgium, and Norway the law is still on the statute book, but the penalty has not for years been exacted. In Denmark only three persons have been executed in over twenty years. In Germany the death penalty would have been abolished in 1870, had not Bismarck demanded on the third reading of the Bill a restoration of the penalty, and carried his point. In Russia, murder is punished by penal service in the Siberian mines, the death penalty being reserved for crimes against the State. The guillotine and the gallows still occupy an important place in French and English penal law, but the victims are diminishing with every decade.

The question is ceasing to be one of sentiment, and is appealing more and more to those principles of justice in which are involved the best interests of the community. No doubt there are many so little removed from the animal creation in all their brute instincts that at large they are a constant source of danger; but is the fault actually theirs? Looking back through the strain of heredity, and unhealthy mental and physical training, would not the Church and the State be doing better service in the prevention of crime to cleanse society from the incentive to crime, and, while it exacts a penalty, stop this side of the taking of life?

A FOOL in revolt is infinitely wiser than the philosopher forging a learned apology for his chains.—*Rossiter*.

## HUDSON'S EXTRACT OF SOAP

## HUDSON'S DRY SOAP.

## RECOMMENDED

For the preservation of lawns, laces, beautiful washing fabrics, underwear, fine linen, shirts, sheets, &c., HUDSON'S EXTRACT OF SOAP and HUDSON'S DRY SOAP are recommended. Instead of the offensive soapy smell common in many Soaps, HUDSON'S leaves the linen actually sweeter and fresher than when new.

Just published, 1s., post free 1s. 1d.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience. Offices—18, Catherine Street, Strand, London, W.C.

## Notes &amp; Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

## QUESTIONS.

DISINFECTANT.—How can I make an efficient and powerful liquid disinfectant? Those advertised are so dear.—*Fred Dicks*.

EMIGRATION.—1. Which is the cheapest way to get from London to California, direct or otherwise? 2. In what parts of it can employment of a lighter kind be most readily found—work demanding intelligence more than muscular strength—horticulture, &c., rather than agriculture. 3. What clothing is needful?—*Thurston*.

## ANSWERS.

DOG.—Procure some of the best olive oil, and after washing the ear carefully with lukewarm water, and thoroughly drying (in the daytime) drop into the ear two drops of the oil. Follow this up daily—say, for a week—during which time carefully examine the ear; if a piece of wax is visible, remove it, but do not probe for it, as in this case the ear is very tender.

PROPERTY.—As next friend of your infant daughter you can compel the trustees, by proper proceedings in the Chancery Division, to give information and show their accounts in reference to the trust, and if a friendly application, a solicitor's letter will probably have the desired effect.

## ANSWERS TO CORRESPONDENTS.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

## ADVICE GRATIS.

## BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a Postal Order for ONE SHILLING or more. SUBSCRIBERS are REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than Thursday, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on Friday. The answers to these will therefore appear in the issue of Saturday week following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

## The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:—

King's College Hospital.	Nazareth House, Ham-
University College Hos-	psmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

REED.—Your general condition is obviously due to the fact that you take little or no exercise. If your life is constrainedly sedentary, then you should endeavour to obtain as much active exercise as you can, when you have the opportunity. Be careful to keep your diet light, and as free as possible from all indigestible matters. Take a teaspoonful of Dunn's Fruit Saline every morning, and the following medicine during the day: Acid tartrate of potash two drachms, infusion of chiretta to six ounces. One sixth part three times a day between meals.

F. S. H.—Peruvian bark will not strengthen your system at all. Unless you know something about therapeutics (which, by the way, it is obvious you do not) it is useless for you to attempt to prescribe for yourself. Now, do not be offended, but turn the matter over in your own mind: What do you really know about the matter? You had better give us a list of your symptoms, and we shall be very happy to assist you.

SHYLOCK.—This flushing is not produced by the cause you imagine, but by your extreme self-consciousness—that is to say, you think too much about yourself, your feelings and pains, and fancy that other people take the same interest in you as you do in yourself. You will get rid of this as you get older and wiser. Everyone is too much engaged with his or her own feelings to trouble about you, so never fear. You are evidently not very strong, by your having a tendency to get knock-knees. There is nothing you can do for this latter, except to prevent fatigue. You had better see some doctor about it.

## DR. DUNBAR'S ALKARAM;

or Anti-Catarrh Smelling Bottle,  
Is the only cure yet discovered for Colds  
by inhaling.

## ALKARAM.

If inhaled on the first symptoms of Catarrh. Will at once arrest them, and in the severest cases will generally cure in a single day.

## ALKARAM

Contains no narcotic, the smell is agreeable and reviving, and relieves head aches; in fact, it should be on every toilet table.

## ALKARAM

Is sold by all Chemists at 2s. a bottle.  
Address DR. DUNBAR, care of F. Newbery and Sons, 1, King Edward Street, London, E.C.

## DOUGHTY'S VOICE LOZENGES

## KEEP THE VOICE IN TONE.

From Signor TOMMASO SALVINI, the Eminent Tragedian.

"Theatre Royal, Drury Lane, May 23, 1875.

"SIR,—The other night, when my voice would have otherwise failed, I was able to accomplish my duty to the very last in 'Othello,' which I owe entirely to your Voice Lozenges."

## ASK YOUR CHEMIST FOR THEM.

Sold in boxes by all chemists, 1s., 2s. 6d., 5s., and 11s., or will be sent direct, post free, for 1s. 2d., 2s. 9d., 5s. 4d., and 11s. 6d. Sample boxes 6d., post free 7d.

FRANCIS NEWBERRY AND SONS,

1 and 3, King Edward Street, Newgate Street, London.

Established A.D. 1746.

## NERVE AND "BRAIN" SALT.

## FOR

## HEADACHE

## AND

## SEA SICKNESS.

"BRAIN SALT." (title registered in Great Britain and America) is sold at 2s. 9d. per bottle, and cannot be obtained of dealers in cheap medicines for the low prices sometimes accepted for articles similarly priced. See on all bottles of genuine "Brain Salt" the Government Stamp, bearing the words "F. NEWBERRY AND SONS, 125 years in St. Paul's Churchyard, London."

F. NEWBERRY and SONS, 1 and 3, King Edward Street, Newgate Street, London, E.C. (established A.D. 1746), send "BRAIN SALT," postage paid, for 3s., to any part of the United Kingdom; and those who fail to procure it of chemists may thus readily obtain it from the Sole Proprietor.

CERO.—We have examined the sample forwarded and find mucus, and a little pus suggesting that there may be some slight abrasion, or stricture, of the urethra. This is, however, no constitutional trouble, and has nothing to do with the tonsils, which is a separate affair altogether. If you wish to get them well, you must give up smoking, though beer does not hurt, and suck chlorate of potash lozenges, taking a teaspoonful of Fellow's Syrup three times a day to improve the general health. With regard to the other matter, it is a common thing to exhibit certain irritability when the bladder is full. The urethra trouble should be treated locally by the use of suitable instruments, which you will not be able to use yourself, at any rate, at first, without setting up inflammation. It would be better, therefore, to see a good doctor about it, and after being shown you may possibly continue the treatment yourself.

DISAGREEABLE.—Of course, if your tongue is foul, you cannot expect your breath to be sweet. Now, why is your tongue foul? Over-loading the stomach may be the cause, or unsuitable diet. You should take only very light and easily-digested food, like boiled fish or chicken, Frame Food Jelly, soups, and all other simple diet. No fat, nor sugar, no stewed sauces, pickles, &c. Cadbury's, Epps', or Fr's Cocoa are all very good for you. You had better keep the bowels freely open by means of a pill composed of the following: Blue pill one grain, sulphate of quinine one grain, powdered rhubarb one grain. This may be taken every night and followed the next morning by a dose of salts. Take the following medicine: Liquor potassae one drachm, infusion of chiretta to six ounces. One-sixth part three times a day between meals.

ALF. BLACK.—You must look well after your general health, taking a cold bath every morning, and keeping the bowels freely open; get also as much active outdoor exercise as you can. For the throat, you must use a chloride of ammonium inhaler, and use it several times a day; any chemist will supply you with one. Take the following powder: Borax, chloride of sodium, and bicarbonate of soda, of each seven grains, powdered white sugar fifteen grains, and dissolve in half a tumblerful of warm water and sniff up into the nostrils, bring it out of the mouth. As a general tonic, take a teaspoonful of Easton's syrup three times a day, and avoid spirit drinking, though beer will not hurt.

QUENTIN.—We have carefully considered your explicit letter, and have come to the conclusion that most, if not all, of your troubles owe their causation to dyspepsia of long standing. 1. Among the consequences appears to be distension of the veins of the lower bowel, which would account for the alteration and shape of the excreta, as well as for the mucous discharge. 2. The aching in all these parts is due to venous distension of the pelvic veins, in its turn dependent upon hepatic congestion, and that again upon dyspepsia. 3. Spasmodic constriction of some of the arterioles. Not an indication of approaching paralysis by any means. 4. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 5. This condition accompanies 2. 6. Due to the same cause. 7. The custom is not known to us as such, but, at any rate, as far as cleanliness is concerned, it has much to recommend it. 8. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 9. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 10. This condition accompanies 2. 11. Due to the same cause. 12. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 13. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 14. This condition accompanies 2. 15. Due to the same cause. 16. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 17. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 18. This condition accompanies 2. 19. Due to the same cause. 20. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 21. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 22. This condition accompanies 2. 23. Due to the same cause. 24. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 25. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 26. This condition accompanies 2. 27. Due to the same cause. 28. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 29. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 30. This condition accompanies 2. 31. Due to the same cause. 32. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 33. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 34. This condition accompanies 2. 35. Due to the same cause. 36. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 37. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 38. This condition accompanies 2. 39. Due to the same cause. 40. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 41. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 42. This condition accompanies 2. 43. Due to the same cause. 44. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 45. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 46. This condition accompanies 2. 47. Due to the same cause. 48. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 49. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 50. This condition accompanies 2. 51. Due to the same cause. 52. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 53. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 54. This condition accompanies 2. 55. Due to the same cause. 56. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 57. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 58. This condition accompanies 2. 59. Due to the same cause. 60. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 61. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 62. This condition accompanies 2. 63. Due to the same cause. 64. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 65. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 66. This condition accompanies 2. 67. Due to the same cause. 68. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 69. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 70. This condition accompanies 2. 71. Due to the same cause. 72. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 73. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 74. This condition accompanies 2. 75. Due to the same cause. 76. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 77. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 78. This condition accompanies 2. 79. Due to the same cause. 80. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 81. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 82. This condition accompanies 2. 83. Due to the same cause. 84. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 85. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 86. This condition accompanies 2. 87. Due to the same cause. 88. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 89. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 90. This condition accompanies 2. 91. Due to the same cause. 92. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 93. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 94. This condition accompanies 2. 95. Due to the same cause. 96. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 97. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 98. This condition accompanies 2. 99. Due to the same cause. 100. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 101. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 102. This condition accompanies 2. 103. Due to the same cause. 104. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 105. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 106. This condition accompanies 2. 107. Due to the same cause. 108. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 109. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 110. This condition accompanies 2. 111. Due to the same cause. 112. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 113. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 114. This condition accompanies 2. 115. Due to the same cause. 116. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 117. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 118. This condition accompanies 2. 119. Due to the same cause. 120. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 122. This condition accompanies 2. 123. Due to the same cause. 124. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 125. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 126. This condition accompanies 2. 127. Due to the same cause. 128. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 129. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 130. This condition accompanies 2. 131. Due to the same cause. 132. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 133. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 134. This condition accompanies 2. 135. Due to the same cause. 136. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 137. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 138. This condition accompanies 2. 139. Due to the same cause. 140. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 141. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 142. This condition accompanies 2. 143. Due to the same cause. 144. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 145. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 146. This condition accompanies 2. 147. Due to the same cause. 148. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 149. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 150. This condition accompanies 2. 151. Due to the same cause. 152. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 153. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 154. This condition accompanies 2. 155. Due to the same cause. 156. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 157. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 158. This condition accompanies 2. 159. Due to the same cause. 160. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 161. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 162. This condition accompanies 2. 163. Due to the same cause. 164. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 165. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 166. This condition accompanies 2. 167. Due to the same cause. 168. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 169. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 170. This condition accompanies 2. 171. Due to the same cause. 172. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 173. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 174. This condition accompanies 2. 175. Due to the same cause. 176. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 177. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 178. This condition accompanies 2. 179. Due to the same cause. 180. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 181. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 182. This condition accompanies 2. 183. Due to the same cause. 184. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 185. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 186. This condition accompanies 2. 187. Due to the same cause. 188. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 189. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 190. This condition accompanies 2. 191. Due to the same cause. 192. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 193. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 194. This condition accompanies 2. 195. Due to the same cause. 196. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 197. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 198. This condition accompanies 2. 199. Due to the same cause. 200. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 201. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 202. This condition accompanies 2. 203. Due to the same cause. 204. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 205. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 206. This condition accompanies 2. 207. Due to the same cause. 208. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 209. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 210. This condition accompanies 2. 211. Due to the same cause. 212. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 213. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 214. This condition accompanies 2. 215. Due to the same cause. 216. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 217. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 218. This condition accompanies 2. 219. Due to the same cause. 220. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 221. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 222. This condition accompanies 2. 223. Due to the same cause. 224. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 225. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 226. This condition accompanies 2. 227. Due to the same cause. 228. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 229. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 230. This condition accompanies 2. 231. Due to the same cause. 232. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 233. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 234. This condition accompanies 2. 235. Due to the same cause. 236. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 237. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 238. This condition accompanies 2. 239. Due to the same cause. 240. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 241. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 242. This condition accompanies 2. 243. Due to the same cause. 244. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 245. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 246. This condition accompanies 2. 247. Due to the same cause. 248. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 249. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 250. This condition accompanies 2. 251. Due to the same cause. 252. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 253. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 254. This condition accompanies 2. 255. Due to the same cause. 256. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 257. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 258. This condition accompanies 2. 259. Due to the same cause. 260. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 261. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 262. This condition accompanies 2. 263. Due to the same cause. 264. The local medicine course of some of the arterioles. Not an indication of approaching paralysis by any means. 265. The aching, distension, and flatulence, and liability to indigestion are due to the same causes as 1 and 2. 266. This condition accompanies 2. 267. Due to the same cause. 268. Full Particulars will be Sent on Application.

**THE SANITAS Co., LTD.,**  
BETHNAL GREEN, LONDON.  
(Sole Manufacturers also of the famous "Sanitas" Disinfectants.)

**RAILWAY PORTER.**—We fail to see, why you should call indigestion "a humiliating trouble." Brandy and eggs the first thing in the morning is, of course, the worst thing you can take. Your food must consist of boiled fish or chicken, Frame Food Jelly, and other light, easily assimilable articles of diet. Be careful to keep the bowels freely open by means of Dunn's Fruit Saline taken every morning, with a little liquorice at bedtime. Take the following medicine: Bicarbonate of soda two drachms, aromatic spirit of ammonia one drachm, infusion of gentian to six ounces. One-sixth part three times a day between meals.

**WM. YATES.**—You cannot treat this yourself, it will be necessary for you to see some specialist. It would be absurd for you to entertain any prospect of the kind just now. Send a stamped addressed envelope, reminding us as to what is the matter with you.

**ANDREW.**—It is not very certain what the cause is, but it has been very frequently referred to certain salts being present in the water drunk. It is supposed to be much more frequent in Derbyshire. We are not aware that there is any specialist on the matter, but, if you like to send a stamped addressed envelope, we can give you the names of half-a-dozen leading London physicians, with their addresses.

**J. MCW.**—We do not think you will get permanently rid of them by any other method than by operation, and the consideration of the latter depends a good deal upon your state of health. After all, there would be no necessity to have anything serious done, painting with, or injecting into them, a ninety-five per cent. solution of carbolic acid will often cure them and dry them up. The best plan is to see some good surgeon on the matter.

**CAROLINE.**—The hair must be combed, and the eggs removed from the hairs every day until no more are left. This is the only way to cure them. They are most likely causing the irritation of the scalp. 2. Simply through infection. 3. No; no necessity for that. Have the pillow-cases washed and ironed, together with the sheets.

## FAILING EYESIGHT

Persons suffering from Defective Vision (particularly those who have been unable to get suitable glasses elsewhere), should consult Mr. Bluett, who has had thirty years' practical experience in making and adapting Spectacles for every form of Defective Eyesight, and for which he has received numerous unsolicited testimonials.

The Eyes Carefully Examined and Sight Tested FREE, Spectacles from 1s. 6d. per pair.

SAFE AND RELIABLE.

Established 70 Years.

See Trade Mark on Wrappers. Beware of Imitations.  
SOLD BY CHEMISTS EVERYWHERE.

**REPENTANT.**—This is generally due to sleeping on the back. You have not mentioned as to whether you have adopted any measures to prevent their occurrence. You had better get a large cotton reel, and tie it in contact with the back before you go to bed at night, so that should you have any tendency to sleep on your back, the pressure of this reel will wake you. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bed-time, and followed the next morning by a mild dose of aperient fruit salts. Take the following: Bromide of potassium two drachms, chloroform water to six ounces. One-sixth part three times a day.

**S. H.**—Much depends upon your general health; the size of the varicocele, and the kind of operation adopted. Also what importance you attach to the two alternatives. The age is no barrier.

**L. W. C. K.**—We would not advise you to get married without seeing a doctor and obtaining his advice relative to the varicocele. This latter may be operated on very successfully without any inconvenience. With regard to your father, let him take the following: Solution of acetate of ammonia one ounce, syrup of squills two drachms, sweet spirit of nitre one drachm, chloroform water to six ounces. One-sixth part every four hours. Let him wrap himself up warmly, and keep out of draughts.

**RECREM.**—The plan you suggest is the best possible. But be careful that the corsets exercise no pressure, as this is generally the cause of this little deformity.

**R. J. C.**—We gave an article on this subject in our columns only a fortnight or so ago. You must keep up your general health, dress warmly, and take a teaspoonful of ammoniated tincture of quinine three times a day. Look after your general health as much as possible, pay due attention to the state of the bowels, eat well of good nourishing food and get up the circulation by taking plenty of active outdoor exercise. This is the best treatment we can suggest.

**MAYFLOWER.**—1. Yes. 2. No. There is no doubt that all your symptoms point to one thing only.

**F. THORNTON.**—If you like to send a stamped addressed envelope we can recommend you an eminent London specialist, but we know of none in Belfast. You need not be afraid that we shall refer you to quacks.

**VARICOSE.**—The bathing and suspensory bandage are merely palliative measures; that is to say, they may prevent the veins from increasing in size. But if you wish them to be finally obliterated, it will be necessary to undergo a slight operation.

**VENDREX.**—Yes, certainly; they are called *cryptorchids*. There is no special work in English on the subject.

**A. NEW SUBSCRIBER.**—We should advise you to take iron in a more digestible form than that of the mixture. For example, take the following pills for a considerable period—say months. Bland's Pills three grains arsenious acid one-sixtieth grain. Of course we are unable to say whether there are any more papillomata to be removed. Take a pill three times a day after each meal. Try and get a little more into the open air; of course, as is usual, your business is absolutely the worst possible for your complaint. In fact, it has been no doubt the chief cause of it.

**ENVIPER.**—It would be dishonest of us to pretend to know the nature of these spots, but your history is highly suspicious. We should strongly recommend you to see a good doctor at once, so that treatment may be commenced immediately.

**A. J.**—The only plan is to place yourself under the treatment of someone who is accustomed to dealing with these troubles; but you will not find such an one in your part of the world, you will have to come to London. When you have resolved upon your line of conduct, and wish to come to town, if you send a stamped addressed envelope, we will recommend you to whom to go on your reminding us of the nature of your complaint.

**NERVOUS and WEAK MEN.**—Vigorous Vitality Ensured to men suffering from nervous exhaustion, low vitality, &c. Try **HALE'S** (the only genuine that does not blister or injure the skin) **PATENT ELECTRIC BELT and Suspensor.** Comfortably curative. Effective in electric qualities. No metallic contact with the body. This scientific appliance will infuse a mild continuous current through the diseased nerve centres. Descriptive circular, undoubted testimony, sent free. **ARTHUR HALE and SON, Medical Galvanists, 30, Regent Street (Piccadilly Circus)**

**JNO. T. SUDES.**—You say you have been under treatment and the treatment has done you good. Now, of course, we are flattered by your applying to us for suggestion, but, inasmuch as we are constrained by honor to say so, would it not be better for you to have one of your old prescriptions made up, or keep yourself continually under treatment by seeing the doctor, say, once a month or so? You will probably never finally get rid of this complaint, therefore we suggest the advisability of your attending a doctor who has already seen the condition. We have not seen what stage it is in, hence we are so far powerless to be of material assistance to you.

**TEMPERANCE.**—It is probably allied to winter-lichen. You must wrap yourself up warmly, eat well, keep the bowels freely open, look after the digestion, take plenty of active outdoor exercise to keep up the circulation. Take warm baths and rub the part vigorously with pure vaseline every night or morning. It is in a measure due to acidity, therefore, you may try the following medicine: Salicylate of soda one drachm, bromide of ammonium one drachm, syrup of oranges one drachm, chloroform water to six ounces. One-sixth part three times a day. Avoid sugar, fat things, and greasy things, also pastry, and puddings.

**ELECTRICITY.**—1. The number of cells used is not a sufficiently accurate measurement of the current strength. 2. A out five milliamperes is the proper current. 3. For five minutes. 4. About No. 12 English catheter. 5. Negative pole in canal, the other at an indifferent point and, &c. We fear you will not derive much satisfaction from self-treatment.

**J. E. F.**—We are very glad to hear that your face has got so much better; with regard to the scars left behind, you must rub the face well so as to stimulate nutrition and disengage change; they will get much better in time. You may use a slight stimulant like dilute acetic acid or toilet vinegar. We cannot recommend you to use any of the remedies you refer to. You may of course change from the qualified to the unqualified, but you will be foolish to do so.

**ONE IN DISTRESS.**—You should take a cold bath every morning and get plenty of active outdoor exercise during the day. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bed-time, and followed the next morning by a mild dose of aperient fruit salts. Your meals must be taken regularly, and must consist of plain nourishing food. Take Woodward's Frame Food Jelly, as being nutritious, and eat Hovis bread. Take also the following medicine: Bicarbonate of soda two drachms, aromatic spirit of ammonia one and a half drachms, infusion of gentian to six ounces. One-sixth part three times a day.

**TOOTHACHE.**—1. Unless decay is advancing rapidly, the pain is probably due to debility of the general nervous system. The treatment therefore will be to stimulate nutrition and general tone. Take quinine sulphate two grains, dilute phosphoric acid ten minims, solution of ferric chloride (B.P.) two minims, water to half an ounce. Three times daily after food. Keep the bowels acting freely with a morning dose of sulphate of magnesia. 2. Cleansing the teeth twice a day with myrrh and borax in warm water. 3. None on the teeth; sedative and an astringent on the gums.

**ADA.**—No! We do not advise upon such matters.

**J. PASH.**—1. We agree with the post-office doctor as to the nature of your trouble, and as to the time you will need to take the medicines. The period should be rather over two years of steady treatment, if you wish to be well subsequently. We do not know of any cheap, reliable work on the disease. There are the works of the late Mr. Berkeley Hill, which may be obtained at any medical booksellers, but they are quite technical. 2. At the moment, we do not recall any articles on syphilis published in the FAMILY DOCTOR. 3. You may certainly smoke a little, and drink, say, a pint of beer a day, but you must not touch spirits or other stimulants. Take as much green vegetable as you please. 4. Your friend is wrong. Not all the permanganate of potash in the world would remove the blotches.

**R.A.**—This condition of congenital or hereditary psoriasis is very hard to cure. You had better go on with the ointment you have been using, and take five drops of Donovan's Solution three times a day immediately after meals. Avoid all sweets, fatty, spicy, beer, and wines. Keep the bowels freely open, and take frequent warm baths, rubbing the ointment into the spots when the scales are well off. Get a fair amount of outdoor exercise, and be careful to protect yourself from cold as much as possible. This is the only form of treatment applicable to this complaint.

**S. A. C. Belfast.**—Without knowing something about your age, occupation, and mode of life, we cannot give you the slightest information.

**CONSTANT READER.**—You are probably suffering from astigmatism, and have not been supplied with the proper kind of glasses. We should advise you to go to some eye infirmary in your neighbourhood, and have your eyes examined by one of the physicians.

**S. C. F.**—The ordinary daily habits of washing should prevent you from suffering from this discharge. There is nothing abnormal about it if you will only pay the least attention to it. Take a cold bath every morning, and keep the bowels freely open by means of a teaspoonful of compound liquorice powder, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Eat regularly of plain, nourishing food, and take plenty of active outdoor exercise. Take a teaspoonful of Sellers' Syrup three times a day immediately after meals.

130th Thousand Post free of Author, 2s. 6d.

## THE CURE OF CONSUMPTION

**CHRONIC BRONCHITIS, ASTHMA, & CATARRH.**  
By E. W. ALABONE, M.D. Phil., U.S.A., F.R.M.S.,  
Late M.R.C.S. Eng., late Consulting Surgeon to the  
Lower Clapton Orphan Asylum, &c., Lynton House,  
Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIRN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

"The FAMILY DOCTOR may be recommended as safe and useful in all Households."—The People.

**MRS. POOLE.**—We are not aware that there is any other name for it. It is a patent preparation from coal-tar products, we believe. You will doubtless be able to obtain it at any good chemist's like Corbyn's, Allan and Hanbury's, &c. **WHILLOW COUNTRYMAN.**—You did not keep on long enough with the medicine we ordered. While you were taking it you were better, so soon as your occupation does not permit of a more healthy life, we think it would be well for you to keep on with the drugs in a more modified form for some time. You are not satisfied, the saliva runs from the mouth because you sleep with your mouth open.

**S. H. ABLETT.**—There is no cure for varicose but by operation, so you need not entertain the idea that you are going to be cured without, however clever an advertising firm it may be.

**S. W.**—There is nothing that will remove the sear of a burn. If you attempt to do anything to it you will only make matters worse. We do not remember saying anything about your getting better.

**A. JEFFERY.**—You seem to be in a great hurry to have children; you must have patience. The apparent peculiarities you point out are no peculiarities at all, but perfectly normal in every way. There is nothing here for any doctor to do.

**E. F. O.**—When she is in such a dangerous condition you should certainly let her go to a hospital if you cannot try a little more. With regard to the matter of prescribing to pay a medical man. Unless you have medical attention for this state of affairs, she will be so ill as to be past recovery. We hope that before this reply reaches you you will have seen a doctor.

**ESAU.**—You cannot destroy this yourself, but it can be permanently removed by electrolysis carefully used by an expert. If done by anyone else, the remedy will be worse than the disease.

**NO. 15.**—You must do what you like; we have given you a well considered prescription.

**ROSALIE, A.**—We cannot tell you what is the cause of this pain at the left side, therefore we think it would be better for you to see a medical man who can thoroughly examine you and find out what is the matter. You might try a belladonna plaster placed over the part, this may relieve the pain a little. With regard to the nose, you should use the pain a little. With regard to the nose, you should use the pain a little. With regard to the nose, you should use the pain a little.

**MOTHER IDA.**—We would advise you to have the operation for cleft palate performed at once, or at the earliest possible moment. We do not know of any suitable feeding bottle, but as feeding with a spoon is far better for the baby, being preferable on every sanitary ground, we do not think you need trouble to discover such a bottle. It would be ridiculous and wrong to wait until baby is three years old before having the operation done.

**ANILE.**—In either case she should see a good medical man, or one of the physicians at some women's hospital near to where she lives. This condition is due to inflammation of the internal organs, probably caused by too early use of it. It is not at all analogous to the loss of fluid you mention. At about rest and proper food and medicine until well are the best things.

**BILIOUSNESS.**—The cause is, of course, insufficient exercise; walking about is quite inadequate. You should get a cold bath every morning, and be careful about your diet. As a rule, bacon, fried, is not looked upon as a first-rate diet for bilious subjects. We should advise a Frame Food diet. Savory's Farina Food, and other pre-digested foods as preferable. Then it would be advisable to take a teaspoonful of Epsom salts every morning before breakfast. Take also the following pill every night: Blue pill two grains, sulphate of quinine one grain, powdered rhubarb one grain. To make one pill, to take every night, and the following medicine: Dilute nitric acid one drachm, tincture of nux vomica twenty minims, chloroform water to six ounces. One-sixth part three times a day.

## A WONDERFUL MEDICINE. Beecham's Pills

ARE universally admitted to be worth a Guinea a Box for Bilious and Nervous Disorders, such as Wind and Pain in the Stomach, Sick Headache, Giddiness, Fulness and Swelling after Meals, Dizziness and Drowsiness, Cold Chills, Flushings of Heat, Loss of Appetite, Shortness of Breath, Costiveness, Scoury and Blotches on the Skin, Disturbed Sleep, Frightful Dreams, and all Nervous and Trembling Sensations, &c. The first dose will give relief in twenty minutes. Every sufferer is earnestly invited to try one Box of these Pills and they will be acknowledged to be

### WORTH A GUINEA A BOX.

For females of all ages these Pills are invaluable, as a few doses of them carry off all humours, and bring about all that is required. No female should be without them.

For a Weak Stomach, Impaired Digestion, and all Disorders of the Liver, they act like magic, and a few doses will be found to work wonders on the most important organs in the human machine. They strengthen the whole muscular system, restore the long-lost complexion, bring back the keen edge of appetite, and arouse into action with the rosebud of health the whole physical energy of the human frame. These are FACTS testified continually by members of all classes of society, and one of the best guarantees to the Nervous and Debilitated is BEECHAM'S PILLS have the Largest Sale of any Patent Medicine in the World.

### BEECHAM'S MAGIC COUGH PILLS.

Sold by all Druggists and Patent Medicine Dealers everywhere.

N.B.—Full directions are given with each box.

**ANXIOUS WIFE.**—Take the following mixture three times a day: Bicarbonate of soda twenty grains, sulphate of potash twenty grains, tincture of nux vomica six minims, camphor water to half an ounce. Bathe with aromatic vinegar and water, a teaspoonful to half a pint, several times a day. Eat your food very slowly, avoid stimulants and coffee, and write us again in a fortnight, stating the results.

**JANIE.**—Use some camphor liniment for rubbing the fingers upwards with, twice or three times a day. Deficient circulation is the cause of the difficulty.

**THOMAS ATKINS.**—Your treatment should be persevered in, for at least six months after every sign of disease has disappeared, and you should not marry for at least six months after you have ceased to need treatment of any kind. Take the following mixture regularly twice a day: Solution of perchloride of mercury twenty minims, iodide of potassium eight grains, glycerine twenty minims, tincture of bark half a drachm, and water to half an ounce. Do not smoke, and cut down the stimulants to vanishing point.

**DEJECTION.**—Yours is truly a pathetic appeal for assistance, but we must say we think you have taken a rather too exaggerated view of your case. For instance, the animal craving to which you refer is perfectly natural, but any excessive indulgence in it should, of course, be checked. With regard to your badness, that is not necessarily produced by the cause you ascribe, but may be due to other causes connected with your occupation. If you have anything the matter with you, we mean physically, let us know what it is, and we shall be very happy to assist.

**RENE.**—The black lines under the eyes are most likely due to your indigestion. You must try and get rid of this, if possible, by eating plain food, and by taking a little of the liquorice powder taken occasionally, and followed the next morning by some Dunn's saline. Eat boiled fish and chicken, not stews or made-up dishes, and avoid beer, wines, and spirits. Take also the following medicine: Subnitrate of bismuth one drachm, mucilage three drachms, infusion of gentian six drachms, water to six ounces. One-sixth part three times a day, immediately after meals.

**PETITION.**—Yes, a doctor could give an approximate reply; but if a woman desired it, no medical man could definitely state the contrary at such an early period.

**WORCESTERSHIRE.**—1 & 2. Neither one nor the other of these quick remedies would be of any service whatever. 3. He would probably do himself serious injury in attempting to use such an instrument upon himself. 4. These things are equally worthless with 1 and 2. His best course is to consult a qualified London specialist with a view to undergoing electrolytic treatment, which is the only rational method of curing such conditions. The plans advertised would only result in disappointment.

**VICEROY.**—The discharge consists of prostatic secretion dependent upon a physiological irritability of the prostatic glandular structures. You will need to have some electrolytic treatment in order to remove the tendency. The condition would indicate some disability of the parts for the contemplated union, but the extent could only be ascertained after personal examination by a specialist.

**JEM.**—1. By sensation chiefly, as, unless you are well acquainted with the anatomical structure of the parts, you would be unlikely to discover the condition by palpation. We advise you not to attempt to do so. 2. No. It is not uncommon in people who are perfectly "competent" in every sense of the word. 3. It is very silly, and likely in time to upset his nervous system as well as his general health.

**WILKIN.**—You are quite right to make your diet as light and nutritious as possible. We think you will find benefit from certain invalid foods, such as Savory's Frame Food Jelly, Carrick's Peptonoids. You will find Pepalia, a combination of pepsin and salt, a great aid to digestion of solid food. As a soporific, you had better take ten grains of Sulphonal at bedtime, and the following pill regularly at one time: Aresenic acid one sixteenth grain, extract of gentian one grain. To make one pill, to be taken three times a day, immediately after meals. These must be taken for some considerable period before any really tangible result is visible, but we are sure you will find them beneficial.

**EXPECTANT.**—You will have to obtain a hydrostatic nasal douche (Bailey & Son, instrument makers, Oxford-street, London, W.), and follow carefully the instructions given with it, using the following as a lotion: Braic acid, powdered, one teaspoonful, tannin half a teaspoonful, to be dissolved together in a pint of warm water, and used as a nasal douche three times a day. Take a teaspoonful of Dunn's fruit saline twice a day in water. Drink no stimulant, and take neither sugar nor coffee.

**REGULAR READER.**—1. Two guineas would probably be the fee for each consultation with the gentleman named. 2. We cannot give you the name of a physician in these columns, but shall be happy to do so if you send us an addressed envelope, restating your wish.

**ARITHMETICIAN.**—You had better take a cold bath every morning, and get plenty of outdoor exercise. Keep the bowels freely open by means of a teaspoonful of compound liquorice powder, taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. You should avoid all beer, wine, and spirits, all fats, sweets, and pastry, and take the following medicine: Bicarbonate of soda two drachms, infusion of gentian to six ounces. One-sixth part three times a day.

**ELAN.**—We cannot advise you this without rather acquaintance with the state of affairs. It may be that you are suffering from stone or enlarged prostate, but we cannot assign a cause without more detailed information. It is of no use attempting to treat this pain without knowing something about the cause.

**CANNING T.**—A great deal depends upon the amount of deformity. You had better send a stamped addressed envelope, and we will recommend you to a special medical man.

**PICA.**—The thick substance is due to want of cleanliness, you should use plenty of soap and water. The other matter is due to an over-sensitive of the parts, and can only be overcome by some weeks or months of regular treatment. You should take morning cold baths, keep the bowels freely open, and refrain from stimulating food and drink. Take a teaspoonful of Fellow's syrup three daily.

**SELLERS' CLEANSING AMMONIA** is a perfect boon to every household. A little added to the Bath softens the water, cleanses the skin, promotes health and vigour, and secures all the benefits of a Turkish Bath without any risk or inconvenience. It is most refreshing for Toilet use, and makes a splendid wash for the Hair. For Laundry use it saves Soap, Soda, and Labour, prevents flannels shrinking, and makes Linen as white as snow. In bottles, 6d. & 1s. each with directions for use. Sold by Chemists, Grocers, &c. or from J. SELLERS, 57, Farringdon Road, London, E.C.

**VALUABLE BARGAIN.**—Grand Rich Tone VIOLIN For Sale. Ringing Tone and in Perfect Condition. Complete with fully Lined Case and Excellent Bow. 18s. 6d. The Whole Lot. Absolutely certain to give highest satisfaction. Approval willingly. A Lot of Music Given Free. Mrs. GRAHAM, College Buildings, Ipswich.

**WHOLESALE.**—Avoid all beer, wines, and spirits, and much walking or standing about. Keep the bowels freely open by means of some aperient salts, and take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One-sixth part three times a day immediately after meals. This must be taken until you are quite well, and for at least a week after.

**LES MISERABLES.**—Your nose is due to dyspepsia and feeble circulation. You should be careful to take plenty of active outdoor exercise, keep the bowels freely open, and attend to your diet, making it as light and nutritious as possible. After washing the face at night, paint some ordinary collodion over the red patch, and leave it on till next morning. This treatment must be continued for some time—say, up to one month—before you can expect to be cured. Take the following medicine also: Sulphate of magnesia one drachm, carbonate of magnesia one and a half drachms, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day between meals.

**VERAN.**—You had better take the general advice we have given to "Wholesale" above, and as you do not like a medical man, and cannot give you pills, you had better take Savare's sandalwood capsules, until you are well. Follow out all our instructions to the letter, and you will soon be quite well. Bathe the parts in cold water, not hot.

**WYNDHAM.**—This form of exercise acts as an irritant to the parts which come in contact with the machine, and is therefore apt to engender functional disorders of the same. We cannot go into the question in detail here, but we are strongly against this form of exercise both for men and women.

**C. A.**—You have not referred us to our reply to you in the "Correspondence" columns, hence we do not know when we replied nor what medicine we ordered. Other doctors' prescriptions are no guide to us, and so we very much fear that we cannot be of further help unless we are reminded.

**A. YOUNGSTER.**—The original injury must have been caused by a blow or strain. The only thing for you to do is to keep the part supported by means of a suspensory bandage, and apply a little iodine ointment to it every night, washing it off again before the next application. Keep the bowels freely open, and do not indulge in excess in outdoor exercise—that is, not until you are too fatigued. With regard to the rest of your queries, there is nothing but exactly normal condition. If you lie on your back you must expect to suffer in the way you mention. You had better take the following: Iodide of ammonium half a drachm, aromatic spirit of ammonia one and a half drachms, infusion of gentian to six ounces. One-sixth part three times a day in a wineglassful of water.

**BOTTLEWASH.**—1. Certainly not. 2. A difficult question to answer as it is put. You may try the following: Tincture of perchloride of iron fifteen minims, sulphate of magnesia half a drachm, glycerine half a drachm, water to half an ounce. Three times daily after food. Take this for a week, then try a teaspoonful of Hewitt's "Liq. Santae Buchu" three or four times a day in water. 3. If not cured, the disease will probably result in stricture. Therefore, if you do not find the remedies named effectual, you had better write to us again for further advice.

**TWENTY-THREE.**—1. See reply to "Bottlewash." Follow the instruction given to him as regards medicines, and use an injection of the following: Sulphate of zinc sixteen grains, alum sixteen grains, distilled water to eight ounces. To be used as an injection three or four times a day. 2. Give up beer for the present. 3. You must wait until every trace of discharge has disappeared.

**JAMES KIRKMAN.**—Keep on with the same pills, getting the chemist to add one quarter-grain of extract of opium to each one. You will find that the medicine will then not upset your stomach in any way.

**SCANTY.**—The information you supply is indeed scanty. Instead of wasting money on mousethe lotions we should advise you to have four artificial teeth placed in your jaw so that you may be at a greater advantage when food is placed in front of you. If you want to have a good mousethe you must get well and strong, get plenty of exercise, and keep the bowels freely open. Also take plenty of good nourishing food. With regard to your asthma or bronchitis, you had better try the following medicine: Solution of acetate of ammonia one ounce, syrup of squills one and a half drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, decoction of senega to six ounces. One-sixth part every four hours.

**SIMPSON.**—You had better go on with the medicine as we recommended. It will probably do you good.

## The Life of Food

is the fat within it—the more fat the more real benefit from food; that is why cod-liver oil is a powerful builder of flesh.

## Scott's Emulsion

of pure cod-liver oil with Hypophosphites has solved the problem how-to-take cod-liver oil. For that reason if no other the medical fraternity prescribe it for all wasting diseases.

*The combination of Hypophosphites peculiar alone to Scott's Emulsion has added vastly to the oil value—they are a direct tonic to brain and nerve.*

Prepared by Scott & Bowne, Ltd., London. Sold by all Chemists and Vendors of Medicine at 2/6 and 4/6.

# MR. SPURGEON'S GARDENER.

**S**PEAKING of the great preacher, a former gardener of his says: "Mr. Spurgeon was one of the most genial and pleasant of men. Although known all over the world, he never put on any of the airs of a great man. He was on a level with the people in sympathy and feeling, which helped to give him his vast influence for good. He would often come into the garden and talk to me about the flowers, especially asking if I understood their Latin names. He was an excellent Latin scholar, and one had to call up all his wits to discuss the subject with him."

Branching off on a topic more personal to himself, the gardener (Mr. James Fuller) continued: "My calling ought to be, and is, a healthy one, but no man can ever tell when and why illness may come. Up to February, 1888, I was strong and well. Then I found my appetite failing me, and my tongue looked like a piece of brown leather. What little I ate gave me pain in the chest and sides, and I had also diarrhoea with severe griping pains. My hands and feet were cold and clammy; indeed, I felt cold all over my body. About a week later I had an attack of rheumatic fever. At first this took me in the hips and shoulders, and then spread to every joint, and I went to bed and sent for a doctor. For weeks I was in great agony and helpless as a baby—not able to move hand or foot. Outward applications gave but little relief. I was harassed by a dry, hacking cough, with much retching and straining to raise the phlegm. I was in this state for over two months, during which time four doctors prescribed for me, but nothing did me any real good.

"One of these physicians, after sounding me, said: 'Fuller, your ailment is the first stage of consumption.'

"He was mistaken, however.

"Some time later I went to the Great Homer Street Hospital, where I received every attention, and several doctors took great interest in my case. My stomach was so weak that for some time I was put on starvation diet. After a while I left the hospital, the doctors saying they had done all they could for me. In a weak, emaciated condition I returned home. After a few

days' rest I went to Freckenham, near Newmarket, to see if my native air would help me. Arriving there I became so bad I could barely walk, my cough and the spitting all the time getting worse, and my breathing short and hurried.

"Despondent and feeble enough by now, I went to Bury St. Edmunds and consulted a celebrated specialist, who gave me medicines but held out no hope of my recovery.

"Time ran along until June, 1888, when I heard some of my Freckenham friends speak so highly of Mother Seigel's Curative Syrup that I determined to try it. In four days I found relief. My appetite returned, food agreed with me, and I gained strength fast. My cough and the other troublesome symptoms soon left me. Having taken the Syrup for a few weeks I was able to return to Norwood and go to work. One old friend who called to see me was astonished, and said to my wife, 'Well, well; I should not have been surprised to hear that your husband was dead.' Thirteen years ago I came to Norwood as gardener to the late Rev. C. H. Spurgeon, and lived at the lodge, Westwood House. I tell everyone that I am indebted for my life to Seigel's Syrup."

Mr. Fuller's present address is 42, Queen's Road, Crown Hill, Upper Norwood, near London.

On this short, clear statement only little comment is called for. In the first place it must be distinctly understood that Mr. Fuller did not have consumption or any other organic lung affection whatever. The symptoms which looked that way arose from the stomach and from nothing else. The cough was a "stomach cough," and the short breath was asthma, resulting from a poison in the blood acting upon the nerves which control the lungs. When Mother Seigel's Curative Syrup had set the digesting machinery in order, and expelled the impurities from the blood, the alarming portents disappeared as a matter of course. The point is this: Don't give yourself up to die of consumption until you absolutely know you have consumption. The chances are a hundred to one that you have what Mr. Fuller had, indigestion and dyspepsia, which can imitate and counterfeit almost any disease under the sun.

## THE PATENT MASTICATOR 16 Blades in One.

TO USE IN PLACE OF KNIFE. For preparing Meats, and other Food for mastication by mining and pulping same on your warm plate, and so preserving all the nutriment. Invaluable to the AGED, YOUNG CHILDREN, and all suffering from WEAK DIGESTIVE ORGANS or DEFECTIVE TEETH.

## GILLINGWATER'S HAIR DYE

GIVES A PERFECTLY NATURAL APPEARANCE.

It is absolutely impossible to detect that the Hair has been dyed when Gillingwater's is used.

GILLINGWATER'S HAIR DYE, for use when the hair is Grey, turning Grey or Faded, also for changing Red Hair to a beautiful Black or Brown. Gillingwater's Hair Dye stands unrivalled by all similar preparations. The safety, reliability, and excellence of this Hair Dye has deservedly won for it a world-wide reputation extending over half a century.

**ADVANTAGES.**—Simple in application; never fails; does not stain the skin; one application only necessary; anyone may apply it; never disappoints.

**CAUTION.**—The great sale of GILLINGWATER'S HAIR DYE has induced competitors to substitute articles of their own manufacture. Purchasers should be careful never to buy a case of Dye that has been OPENED, and always OBSERVE every genuine case bears the Name—"GILLINGWATER AND CO."—to counterfeit which is **FORGERY**.

Strongly recommended in preference to all other Hair Dyes, by the eminent Dr. CHURCH, of the Royal Agricultural College. His Certificate accompanies every bottle. Gillingwater's Dye lasts longest. Obtain Gillingwater's or write direct for it. Gillingwater's will send it, free by post, on receipt of Postal Order for the amount, the package bearing no indication of contents.

Sold, with fullest directions, to dye any desired shade of Brown or Black, in elegant cases, 3s. 6d., 7s. 6d., and 21s.

GILLINGWATER'S HAIR DEPILATORY most effectually and safely removes superfluous Hair from the Face, Neck, or Arms. Large Cases, 3s. 6d.

"FOR THE BLOOD IS THE LIFE."

"The Hon. Surgeon to his EXCELLENCY THE VICEROY OF INDIA prescribes 'Clarke's Blood Mixture' largely, and speaks highly of its efficacy in skin affections, &c. On this account we wrote asking if you could supply the Mixture for dispensing purposes."

Letter from A. JOHN AND Co., Chemists and Druggists, Agra India, June 5th 1888.

"CLARKE'S BLOOD MIXTURE is entirely free from any poison or metallic impregnation, does not contain any injurious ingredient, and is a good, safe, and useful medicine." ALFRED SWAINE TAYLOR, M.D., F.R.S., Lecturer on Medical Jurisprudence and Toxicology.

CLARKE'S WORLD-FAMED BLOOD MIXTURE is a guaranteed cure for all blood and skin diseases. It is the most searching blood-cleanser ever discovered, and it will free the system from all known blood poisons, be they animal, vegetable, or mineral. As it is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, from infancy to old age, the proprietors solicit sufferers to give it a trial to test its value.

Skin Diseases, Eruptions, Blotches, Spots, Pimples, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scuffs, Discolorations of the Skin, Humours and Diseases of the Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

How is it that CLARKE'S BLOOD MIXTURE has obtained such great popularity? is a question which has perplexed many. The answer is that it is unquestionably the finest Blood Purifier that science and medical skill has brought to light, and thousands of wonderful cures effected by it have stamped it as one of the most extraordinary discoveries of modern times.

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the world; or sent to any address on receipt of

33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN.

"7, Canonbury Park North, London, N., Jan. 13, 1892.

"I had a very bad arm for eight or nine months, and had medical advice which did not benefit me much. I met a gentleman at the Crystal Palace, and he told me a friend of his had a carbuncle on his leg, and that your Blood Mixture cured him right out. He advised me to try it, which I did, and after taking four 2s. 9d. bottles I am glad to tell you the place healed quite up, and I have not felt anything of it since.

"I have no objection to your publishing this cure.

"Yours faithfully,

A. BONNER.

"Lutton-road, Long Sutton, Lincs, July 27, 1891.

"I received your letter of the 22nd. The testimonial you saw in the paper is quite true. My leg was bad about five years, and I thought I would try a bottle of Clarke's Blood Mixture, and did so, and, to my great surprise, my leg got on wonderfully well, and is just as well as the other one. The book which is wrapped around the bottle will show you how to go on. It is best to get a case of the mixture, 11s. Clarke's Blood Mixture is worth its praise. I can't recommend it too highly. I am sure it will do your leg good. I have much pleasure in writing this letter to you, because it is a medicine worth buying. It is a great boon to any sufferer.

"Yours truly,

PHILIP BALES."

## EDITORIALS.

**S**PECKS FLOATING BEFORE THE EYE are occasioned by some foreign substance floating in the aqueous humour. The image of an object is formed on the retina in the back part of the eye, and the foreign object passes before that field, casting a shadow upon it in the same manner that clouds float between the earth and sun, casting a shadow upon the earth. Of course it interferes with a clear vision, and is noticeable to a greater or less extent. The specks thus floating are foreign substances which should have been eliminated. With a torpid liver, and torpid elimination, these foreign substances accumulate in the body everywhere, and it is common for them to be thrown into the cavity of the eye. They occasion considerable annoyance, and can only be relieved of this disturbing element by improving the elimination to the extent that all foreign matter is eliminated from the body. This can be done by regulating the diet. See that the bowels are kept in a free state of activity, and a good Turkish bath should be taken once or twice a week until the system is cleared of all offending material. No medicine is required. Above all things, do not treat the eye for it.

**THE ADVISABILITY OF AN OPERATION FOR CATARACT.**—We should always recommend the operation at the proper time, that is, when the cataract is ripe, in which case the individual will be nearly blind in that eye. A cataract is an opaque hardening of the crystalline lens, which by a careful operation can be extracted. This operation leaves the eye clear of any obstruction, but without the lens. Consequently the patient will have to consult an optician, and get a glass to take the place of the lens that was taken out. With this they usually have very good sight indeed. There is so little danger in the operation, and so many chances to receive good vision, that we should always recommend the operation.

**SATISFACTION GUARANTEED.** For Health, comfort, economy. Cases made to order are best. Distance no hindrance. Every kind, lowest prices, best qualities, made quickly by FORD & FAIR, Corset Factory, 141, Stockwell-road, London, S.W. Estb. 1856. Please call or write. Measurement forms free. Try one. [ADVT.]

**DANDRUFF** is caused by an exfoliation of the outer cuticle of the scalp. Cleansing of the scalp is of primary importance. This can be accomplished to advantage by a thorough cleansing of the head and hair once a week with the white of an egg. After thorough cleansing, and to prevent hair falling out, and to improve the nutrition of the scalp, we would recommend the electrical brush, if one can have recourse to a battery. If not, we would recommend as a stimulating lotion the following:—Quinine thirty grains, chloride of sodium, or common table salt, one-half teaspoonful, bay rum eight ounces, rain water eight ounces. This can be scented *ad lib* with the oil of rose. Apply at night with rubbing with the ends of the fingers.

**SWIMMING A HEALTHFUL EXERCISE.**—Swimming is a delightful exercise if not carried to excess, and is beneficial in many ways. It certainly will serve to expand the lungs, and develop the muscles in a remarkable way. The great danger is in remaining in cold water too long, and not being sufficiently protected after coming out.

**CHILBLAINS.**—The best cure for chilblains is prevention, and protection of the extremities by woollen coverings (which can well be worn under silk stockings), and plenty of exercise to keep the blood well circulated, and keeping the feet at a reasonable distance from the fire will obviate the necessity for remedies; except in anæmic subjects or delicate children, whose physique prevents sufficient exercise being taken. In these cases, it is good to wash the feet at night in hot bran water, into which pour some “cloudy ammonia,” after which apply the following lotion:—Pure white soap one drachm, a mild solution of ammonia two drachms, tincture of cantharides two ounces. A less troublesome remedy than the above is to paint the frosted parts night and morning with a lotion made of equal quantities of tincture of iodine and a solution of ammonia.

**COLOUR BLINDNESS AND TOBACCO.**—A new theory has been advanced in regard to the defective colour-sense, which holds that it is probably due to the use of tobacco, and arguments are adduced giving the theory some plausibility. Inasmuch as it is chiefly men who suffer from colour-blindness, there seems some reason to suppose that at least it is due to something peculiar to men, as smoking in this country generally is; and if tobacco is not to be held accountable for it, what is? In the exceptional cases of deficient colour-sense found among women, if the victims do not smoke, they may possess the defect by inheritance.

In 1531 the British Parliament passed an act punishing poisoners by boiling to death.

An interesting note has appeared in *Nature* on the thrush, treated not from an ornithological, but from a bactericidal point of view. The great mortality which prevails among children suffering from thrush gives a considerable value to any investigation into this disease. Alkaline substances are usually recommended to counteract the acidity of the mouth, which is supposed to be favourable to the growth of the fungus. Signor Marantonio, however, who has made experiments in one of the Roman hospitals, finds that thrush grows abundantly in alkaline as well as in acid media. Salicylic acid is found to have a destructive effect upon it, and has been most successfully prescribed in actual cases. Occasionally it appears that thrush is endemic, and the organism has been isolated from the dust in the chinks of a floor. It can stand desiccation for four and a half months, and will weather even fifteen hours of direct sunshine (which is usually fatal to its kind); so that it is a particularly hardy specimen of disease germ, and the wonder is not so much that children die of it as that any manage to escape it.

A SCIENTIST who has investigated the matter states that the men who are employed in the Paris sewers are as healthy as the average person, and no other eight hundred men in that city are so free from zymotic diseases.

**THE BUSY INSECT WORLD.**—A well-known scientist is quoted as authority for the statement that there are five times as many species of insects as there are species of all other living things put together. The oak tree alone supports 450 species of insects, and 200 kinds make their home in the pine. Forty years ago Humboldt estimated that the number of species preserved in collections was between 150,000 and 170,000; but scientific men now say that there must be more than 750,000, without taking into account the parasite creatures. Of the 35,000 species in Europe, however, not more than 3,500 are obnoxious or destructive. There are more than 100,000 kinds of beetles.

**IS SCARLET FEVER DYING OUT?**—A singular fact has been revealed by the carefully kept death records in England. This is a steady diminution in the number of deaths from scarlet fever, which fell from 14,275 in 1881 to 4956 in 1891. No adequate explanation has been offered. As contributing causes, however, Dr. William Ogle finds (1) that the proportion of children to the population materially declined in the decade; (2) that the isolation of the sick and other sanitary practices became more general; and (3) that in some unknown way scarlet fever has been gradually assuming a milder form. The last conclusion is justified by ample evidence. The part played by sanitation has doubtless been of some importance, as may be inferred from the fact that typhoid fever deaths have also been diminishing. Dr. Ogle feels assured that epidemics of scarlet fever will not soon, if ever, again be the scourge of infant life they have been.

**A MELANCHOLY AFFAIR.**—Social customs in Japan differ widely from those which prevail among us. Over there, for instance, a wedding must be rather of a melancholy affair. It is not good form for the bride to admit that she is glad to get married. When she is told of the prospect she is expected to howl loudly and long. Also she must keep it up by day and by night until the ceremony takes place. After she has been richly-dressed for the event she must renew her shrieks, and hang back until one of the attendants throws a veil over her face. Then an old hag takes her on her back, and carries her to a sedan chair. When she arrives at the bridegroom's house she is a wife; the simple rite in the dowry chair being the only legal ceremony required, though profuse entertainment and congratulations from assembled guests follow her arrival.

## RECENT PATENTS.

This list is specially compiled for the FAMILY DOCTOR by Messrs. Rayner and Co., Patent Agents, 37 Chancery-lane, W.C., from whom all information concerning Patents may be obtained gratuitously.

19,377. An improved ambulance combination stretcher. J. TAMBLYN and D. A. SAUNDERS. Oct. 16th, 1893.  
 19,446. Improved appliance for dental purposes. H. GUTHRIE. October 16th, 1893.  
 19,488. The use of collapsible tubes for liquids and powder toilet preparations, inclusive of dentifrices, and inclusive of any preparation in the form of a paste. H. A. ROBERTSHAW & Co., Halifax. October 17th, 1893.  
 19,539. Improvements in surgical dilators. A. BEAVIS, London. October 17th, 1893.

**SHE DIDN'T KNOW THE LADY.**—Mrs Clancy—“Yis, Mrs. Muggins, Pat and Oi part to mate no more. Oi went to the hospital to ax after him. ‘Oi want to see me husband,’ sez Oi—‘the man that got blowed up.’ ‘Yez can’t,’ sez the docther—‘he’s under the influence of Ann Estheticks.’ ‘Oi don’t know the lady,’ sez Oi. mighty dignified loike; ‘but if me lawnd wedded husband kin act like that when he’s at dith’s door, Oi’ll have a divorce from him!’”

“The FAMILY DOCTOR. The contents are varied and useful, with an entire absence of Quackery.”—*Observer*.

[SPECIAL ARTICLE.]

# TRICKS OF FAKIR PRIESTS EXPLAINED.

By C. W. H.

SELF-INFLICTED voluntary tortures have always a grim fascination for the vast majority of mankind. Witness the crowds that will flock to see a man dance on broken glass or bend red-hot irons on his naked flesh, when such feats are performed on the public stage; or watch the assembly applaud the humbler performer in the shape of the fire-eating "nigger" at the seaside; or note the daily records in the public press of the feats of a fasting man, such as Succé.

The other day the writer had an opportunity of watching closely the feats of a gentleman who styled himself a Fakir priest, and, noting that several of the audience got up to leave on seeing the first feat, it dawned upon him that perhaps an explanation of such seeming cruelties might be interesting to my readers. The great bulk of the public is not acquainted with natural law, or the details of anatomy, consequently all performances of the kind seem sensational and horrible in the highest degree, and, to a minority, absolutely revolting. Nevertheless they are not so, but are surrounded by so much stage realism that what are really very innocent performances seem genuine, as I shall endeavour to show.

Let it be remarked that in most of these "shows" things are what they seem—that is to say, if the performer puts an elongated bodkin, which the programme and the gentleman who gives the necessary introduction styles a "dagger," through his tongue, he really does so, but it is practically painless, and no blood issues afterwards.

But let us review such a performance in chronological order. Most of the performers begin by a dance which is generally vigorous, if nothing else; this is supposed to render the person insensible to pain, but I apprehend he would even in this state of insensibility decline to allow any practical test on his body of the *bona fides* of such anaesthesia; as a matter of fact, the writer challenged one performer, and the idea was scouted.

When the dance, which is carried out somewhat in the manner shown in the central figure of the illustration, is completed, various tests are gone through to show the accuracy of this statement, and one of the most startling is thrusting a long-pointed, thin, steel instrument through the tongue. After many flourishes the instrument is passed through the central raphe of the organ, which, to facilitate the operation, is pulled as far as possible forward out of the mouth; then, with the dagger (✓) in position, the Fakir walks through the audience. "Astounding feat!" exclaimed my neighbour at the last séance I witnessed.

Does the hook of an earring hurt when passed through the lobe of my lady's ear, I asked? This performance is on a par; the central raphe of the tongue is of a fibrous nature, with little or no blood or nerve supply, and it is possible to make a hole through it which shall be permanent just as it is so commonly made through the ear. Fig. 4. R., shows the part pierced; the tongue is here represented in section. Many negro tribes cut gashes right through the substance of the lower lip, and wear ornaments in the hole thus made. Tastes differ: Savages wear pieces of stone or wood about the size of a plover's egg through their lips, civilised ladies wear pieces of gold or brilliant, dangling from their ears. The Fakir makes capital out of a less common feat.

The next item on the programme is not so easy to explain, but is, in reality, equally simple. If you examine Fig. 3 you will see that this diagram represents a section of the human eye: A, the eyelid; B, cul-de-sac; C, fat; D, bone; G, the globe; M, muscle; and O, the optic nerve. The operation is described as turning out the eyeball from its socket, and laying it on the cheek. This is utter nonsense; what is in reality done is, a round-ended stiletto is inserted in the cul-de-sac B, the upper eyelid

is pushed up and everted, and the globe at the same time pressed gently (with a vast array of force) forwards, at the same time the lower eyelid is pulled downwards, this gives the eyeball a very startling appearance, and the writer has frequently heard the friends of patients, who have watched an ophthalmic operation when the eyelid everter has been inserted in position, afterwards describe how the eyeball was "taken out and laid on the cheek." Fig. 2 shows the *modus operandi*. By the use of a few drops of a twenty per cent. solution of hydrochlorate of cocaine this feat can be performed by anyone quite painlessly, but I should not advise my readers to try it, because the slightest unsteadiness of the hand might lead to the stiletto puncturing the conjunctiva, and setting up of suppuration of the fat about the eyeball, unless the instrument was surgically clean.

Bites by live snakes, which are described as poisonous, are generally shown. Now one of two factors obtain in this item, either the snake is non-poisonous, or it has been rendered harmless by the destruction of its poison bag, so the snake business can be dismissed without more ado. If any of my readers believe the snake which bites the Fakir to be poisonous and entire, they must be possessed of more gullibility than I give them credit for.

Burning portions of the body with a torch is the most painful thing the performer does, and you are told that the burning will be continued until someone in the audience cries, "Hold!" At the performance I witnessed a person connected with the place cried out, and so the burning was not continued long enough to prove to a poor sceptical mortal like myself that this performance was any more harmless than the previous ones. I have since experimented with a torch, and I find that, held as I saw this one, it can be kept in position a considerable time without much pain. It is not, however, quite on the same footing as touching red-hot iron, or molten lead, with the naked hand, a feat which we were credibly informed some time ago H.R.H. the Prince of Wales had tried, and which is free from pain and easily explained.

Dancing on broken glass is rendered innocuous by the dense thickness of the epidermis of the sole of the foot when exposed to usage. The gamin of the gutter suffers little or no hardship any more than the negro by reason of his barefootedness.

I must now close, but to reiterate, the eyeball is not, as a fact, moved forward, except for a very small fraction of an inch, because such a proceeding is a physical impossibility without stretching the optic nerve and destroying the sight, and all tales of the eye being removed and replaced are bogus, and a trial of your credence. Such performances are not elevating sights to witness, but an explanation of the *modus operandi* takes away the edge from the shrieks of the daily press at such cruelties (*sic*) being allowed. None would go and witness them if they thought the spice of danger was absent, and an exposure of their innocence will do more to stop such exhibitions than all the polemics of leader writers on their barbarity. The derivation of the verb "fakir" is now clear, it is no longer a vulgarism.

TEMPERATURES OF THE POLES.—The Southern Hemisphere is colder than the Northern Hemisphere, or rather the summers are much colder and the winters a few degrees warmer, the reason being that at the North Pole much of the ice which forms is held in by the land, while at the South Pole, there being very little land, the ice forms and then floats toward the Equator, chilling the continents it passes. The greater quantity of water in the Southern Hemisphere is a reason of its more equable climate, and the fact that the sun spends eight days more on the northern side of the Equator than he does on the southern accounts for the average temperature in the south falling below that at the north.

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, LINCOLN [ADVT.]

## THE PHILOSOPHY OF CLOTHES.

IN spite of "Sartor Resartus," we are not sure that there has yet been developed among us any quite satisfactory Philosophy of Clothes. It may be that we are on the way to it, but he might well be pronounced a mere visionary optimist who would declare that the goal has yet been reached. Men may indeed claim that they have at last got a decent and comfortable enough style of dress, if the swallow-tail and the still tolerated abomination called a chimney-pot be excepted. But what of the women? Can it be reasonably maintained that their garments are always modest, and that they are invariably conducive to the maintenance of health? And if not, why not? Here we are in presence of deepest mystery. Who is it that rules? It must be supposed that there is some supreme arbitrator, whether called Wörth or by some other name, who ordains what each woman shall wear, and whose fiat is regarded as law; but why it should be so, no one can tell. And why the women should all follow so humbly and sheep-like the example set by some unknown entity in Paris or elsewhere is also one of those things which no male creature may hope to understand. For our part we should not meddle with the matter if it were not for the intimate bearing which dress has upon health. For this reason alone, we find ourselves reluctantly compelled to study with some care the prevailing fashions of the day.

Some members of the hygienic confraternity seem to be even more completely *au courant* in these matters than we can yet boast ourselves. Thus Dr. Theodor, of Rome, contributes to our valuable contemporary *Gesundheit* an interesting paper on the disfigurement of the body brought about by following the fashion, and the consequent injury done to the health of its votaries. He shows how clothing, which was in the first instance assumed as a protection against climate, and out of considerations of propriety, has often been so perverted from its original uses as to become a dangerous enemy to health. If garments must be worn, the natural expectation would be that they should be made to fit the body; but that is only the expectation of the simpleton, because anyone acquainted with the mode knows that the body must be made to fit the garments. In the matter of dress there are two main questions to be asked: the first is as to what is the fashion; the second (if there be a second) is as to what may be good for the health. The latter is, however, quite a subordinate consideration. Comfort is also secondary; the mode must govern all else. Nature is expected to adapt itself to art, instead of art being serviceable and ancillary to Nature.

The Venus of Milo and the Venus de Medici are the recognised ideals of womanly beauty, noble in curve, perfect in proportion—the expression in imperishable marble of the lovely visions which floated before the imagination of the Greek sculptor; but these ladies must be condemned as hopelessly out of the fashion when tried by the standard of the modern belle, whose wasp-like waist is the triumph of the nineteenth century *modiste*. And this triumph is attained by tight lacing—the prolific parent of a vast number of feminine ailments. Respiration, digestion, circulation—all suffer from this cause; and the lamentable results are palpitation, spinal trouble, migraine, anæmia, chlorosis, dyspepsia, and a thousand other evils. According to Dr. Theodor, the Parisian bodice known as *corset à la sirène* is specially responsible for these and still more specific troubles which have been recently observed in Germany among girls and women who affect this particular kind of vanity; and as he recognises the difficulty which the individual woman finds in withstanding the imperative dictates of fashion, he recommends the formation of unions and societies which should have for their object the promotion of a style of dress which would at least not offend against the primary laws of health.—*Sanitary Record*.

PRIDE is the mask of one's own faults.

## THE TENDENCY TO SKIN DISEASES.

By C. A., M.D.

MOST skin affections should be looked upon as the symptoms and expression of a general constitutional condition. I do not except even the parasitic diseases which, by taking root in the epidermis, awake certain constitutional tendencies. It is just this constitutional cause which accounts for the characteristic obstinacy of dermatoses. "The more obstinate the complaint," said Sydenham, "the more it partakes of the individual." It is especially in these difficult cases that it devolves upon the physician to prescribe a definite regimen and appropriate treatment. Keeping to himself his disquietude and suspicions of possible incurability. From all time, the influence of the nervous system in skin diseases has been recognised. The old dermatologists continually speak of attacks of eczema provoked by anger or joy, and of other cutaneous affections coinciding with nerve-storms and neuralgia. One sees also, frequently enough, psoriasis following on moral causes, on lively and deep emotions. Contemporary works have proved that we must ascribe these mysterious influences to the vaso-motor system. Microscopic lesions of the nerves of the skin have equally caused nutritive changes, and explained the symmetrical distribution of certain skin diseases. Finally, the intimate relationship of lepra, zona, and ichthyosis, with disturbances of the nervous system, are absolutely traditional and well-recognised.

How many eruptions are connected with gastro-intestinal affections! Every day, in treating indigestion, old and rebellious skin troubles miraculously disappear. We all know the relation of nettle-rash to dyspepsia, of acne to constipation. The interference with the natural function of the skin, especially its duty as an eliminator, often aggravates the internal complaint; so that there is a vicious morbid circle, a continual exchange of effete products. We often observe, in this connection also, faulty liver action. People who suffer from bile and heart disease, are predisposed to acne. Is not the liver our great organic scavenger, the gland that the medicine of the ancients charged with eliminating *acid humours*, and to which modern science resigns the duty of microbe-killing? However it be, when the liver is torpid and congested, the skin loses its fresh and supple appearance: itching and eruptions frequently manifest themselves.

We must not fail to observe the connection of genito-urinary complaints with skin diseases. Gravel, albuminuria, uraemia, and inflammation of the bladder, produce boils, carbuncles, nettle-rash, eczema, &c. We know that erysipelas and erythema are connected with the menstrual function; how often acne and eczema appear at the climacteric—the woman's purgatory! The respiratory function has its share also in the production of skin complaints; thus tropical lichen coincides with respiratory weakness in hot countries. We all recognise the muddy earthy look of consumptives. Eczema and asthma are so nearly related that Ducloo looks upon asthma as a kind of acute herpes, a temporary, fugitive, eruptive attack in the organs of respiration. Cazenave lately treated an asthmatic who for seven years had not slept a single night through. This patient was suddenly attacked with eczema in the legs with abundant sweating. The oppression of breathing disappeared from that day, as if by magic. How can one fail to believe, in a case like this, in the intimate relationship between the eczema and the asthma!

It is on account of this relationship that in order to prevent acute morbid relapses, and to hinder the invasion of chronic maladies, we try so often, by friction, massage, and electricity, to maintain or even to revive, the healthy action of the skin. For this reason, it is often necessary to treat old obstinate ringworm

"WEATHER WARNING."—If you have any symptoms of an attack of cold or cough, use at once the universal remedy, KEATING'S COUGH LOZENGES; one alone affords relief in cases of cough, asthma, or bronchitis. Sold everywhere in tins, 134d. each; free on receipt of stamps. Thomas Keating, Chemist, London.—[ADVT.]

almost roughly. Heal up an old extensive eczema, and you substitute diabetes, albuminuria, cancer. It is especially at about fifty years of age that the important function of the skin as an emunctory and natural scavenger is most recognised.

Eruptions at this critical age often supplement functions of atrophied organs, and frequently preserve maladies which are less desirable; this is an axiom with which every physician is familiar. With regard to eruptions manifesting themselves before puberty, they are cured often enough by the development into adult life.

Defective nourishment often excites cutaneous disease. Alibert states that in the poverty which existed during the Revolution the people, being obliged to eat things unfit for food, affections of the skin predominated enormously. During the siege of Paris the St. Louis Hospital was full of patients. Bergeron and Jacquiemer accuse stale milk (ten to twelve months old) of producing impetigo in nurslings. Often in infants and children I have found this to be a cause, and for this reason I advise families never to select as a wet nurse a woman confined less than three months ago.

The vulnerability of the skin is infinitely variable, according to race, climate, and profession. Compare the peasant's child, who handles nettles in the field with impunity, with our modern young lady, who, by means of gloves and toilet accessories, has exaggerated the cutaneous sensibility to such a degree. Children, women, blonde and red-haired, have the finest skin. Great fatigue, and deprivation of sleep render the skin susceptible, as do other causes of debility, dentition, puberty, lactation, &c., everything that relaxes the skin, or interferes with its normal functions, predisposes it to eruptions. Uncleanliness, parasites, variola, blistering fluids, &c., frequently become the cause of the ulterior skin disease.

We are compelled, in the face of near facts, to admit the existence of a gouty predisposition to skin complaints. This explains the long duration, hopeless tendency to relapses, to internal metastasis, to the changing diseased conditions that one always observes in the study of dermatoses; their disappearance in the wake of dangerous illness; the cerebral troubles and cancer which follow their too rapid suppression. Frequently hereditary, the gouty temperament manifests its weak point on the most trifling occasion; a simple blow, an iodised bandage, the handling of irritating substances, develop an obstinate eruption, and reveal the cutaneous susceptibility. This eruption will at all times remain elementary, and will avoid the *derma*, which implies the absence of scars, a thing which does not happen in syphilis and scrofula, which have also their expression in the skin.

The gouty man is as liable to joint-disease as skin disease; but it is a mistake to confuse these two constitutional conditions, which differ in certain important points. For example, in gouty joint-disease there is a tendency to obesity and perspiration, constipation, and hemorrhoids. In skin disease the individual, although a good feeder, remains thin, with a dry skin, and a tendency to diarrhoea. The arthritic loses his hair early, he is a martyr to congested brain, to flatulent dyspepsia and heart-burn. The eczematous patient is subject to itching of the skin, cold in the chest, and further he is nervous and habitually exhibits melancholic tendencies with extreme irritability, which form a contrast to the ordinary indifference of the arthritic. Moreover, the latter suffers from muscular rheumatism, gravel, &c., whilst the other class complains mostly of neuralgia.

COMMERCE, with its spreading wings, has traversed the globe many times, and binds nations together with the strong ties of mutual self interest. Through its influence London has become the metropolis of the world, and her merchants have amassed wealth sufficient to make them the envy of princes. Holloway's Pills and Ointment have now become essential articles of commerce with all parts of the world. They have effected cures which have seemed miraculous, and given relief in complaints when all hope had been lost. In all known diseases their success has at all times been wonderful. In cases of disorders of the stomach, bile, liver complaint, indigestion, fevers, ague, &c., they act like a charm, as the cure is speedy and certain.—[ADVT.]

## FRUITS.

By E. L. CONDIT.

THE value of fruits as food is far from being understood. They are more or less abundant in every part of the world, and nourish and refresh those wise enough to include them among the necessities of life.

Nature has provided under a variety of forms and coverings, the sweets and acids, flavours and oils, essential to the sustenance of every portion of the body. First in importance and universality is the apple, and the grape follows; these have been called the king and queen of fruits. It has been quaintly phrased that "in that case the berries might be members of the royal family; peaches, pears, and plums, members of the cabinet; and tropical fruits, the foreign ministers." Fruits are first cousins to grains, and science has demonstrated that together they constitute a food which produces a well-developed, strong-limbed, and clear-brained people.

The athletes of ancient Greece were trained entirely on a vegetable diet. The boatmen of Constantinople, who live on bread, cherries, figs, dates, and other fruits, have a wonderful muscular development. The children of the desert exist for a long time upon a handful of dates a day, and travellers speak of raisins and parched corn as a common fare.

During the last ten years there has been a most gratifying increase in the use of fruit, and the supply has multiplied and improved to meet the demand. Fruits are to be highly prized, whether fresh or dried, cooked or raw, as food or in beverages, and ought to constitute a large part of the daily fare. Wives and mothers are learning that a farinaceous and fruit diet is not only desirable for the children, but is one of Nature's agencies to provide a sound body and a sound mind, and aid in the formation of temperate desires and habits.

Taste, and often genius, are shown in the arrangement of fruit for the table. All varieties are appropriate breakfast dishes, and the season determines largely what can be used. Fruits should be carefully selected. Melons should be kept on ice, so as to be thoroughly chilled when served. Nutmeg melons should be cut in the grooves and have the seeds removed before serving. Watermelons should either be cut across the middle and served in the rind in sections, or have the heart removed and brought in on plates. Apples should be perfectly ripe and pared before eating. From among the many varieties some can be found suited to almost every month of the year. Sweet apples are particularly nice baked, and served with sweet cream. Bananas are destined to be the fruit of the future, says one importer, and no other fruit possesses such a large amount of nutriment. Grapes should be washed and drained well before serving.

Oranges are to the southern and tropical lands what the apple is to the temperate zone, but the facilities of transportation give each section the benefit of all. The simplest of many ways to eat an orange is to cut a slice from the top and eat the juice and pulp with a spoon. Medical experts claim that a sour orange eaten daily before breakfast produces usually a condition of almost perfect health. Peaches are not only a delicious fruit for food, but beautiful for table decoration.

Apricots and nectarines increase the variety with a delicate though peculiar flavour. Pears are more highly prized each year, and, combined with peaches, plums, and grapes, present a dish delightful to the eye as well as grateful to the palate. The red or strawberry pineapple is greatly inferior to the white, though suggesting its delicious flavour. The sugar loaf, one of the sweetest and best pines, comes from Havana, while some choice varieties are produced in Jamaica. They should either be grated or picked with a fork from the hard core, and sprinkled with sugar a little time before serving.

Many small fruits are used as long as the season allows. The fresh strawberry, raspberry, and blackberry are in great demand on the table; their fine flavour is lost in some measure by cooking. The white currant is a favourite for the table, but the red is more commonly

used in cooking. Red and white currants mixed form a pleasing dish. If berries are clean, do not wash, but pick them over carefully. If they need to be washed, put into a sieve or colander, and set in a large pan of water, allowing the water to flow around each berry. Drain quickly, and avoid mashing. Strawberries may be served on the stem to each person by setting at the plate a glass of water holding a few clusters, and a little dish of powdered white sugar.

## TALES WORTH TELLING.

[COMPLETE STORY.]

### OLD MR. WADE.

BY ALFRED ENGLISH.

THE pompous little chairman of the village chapel committee ended his neat little speech with a final flourish of his fat hands, and, leaning back in his chair, complacently awaited the reply of his audience, the Rev. James Wade. But there was no response from the motionless figure by his side. It was growing dusk, but the flickering firelight showed him the outlines of the old man's gaunt frame, the droop of the bowed head, and the trembling wrinkled hand upon which it rested.

There was something in Mr. Wade's attitude that disturbed the chairman's self-complacency, and he shifted uneasily from one position to another, and wished heartily that his words had remained unsaid.

It had seemed a simple thing. Old Mr. Wade had become old-fashioned and rusty, and outgrown, too, by the people of the bustling little village. What was to be done, then, but to throw him on one side, like any dingy old garment, and replace him with a new minister of later pattern and more popular style. But, for some reason, it is an easier matter to discard an old coat than an old pastor; at least, so thought Mr. Hicks, as he glanced uneasily at his companion.

At last the stillness became unsupportable. He started up and fell to poking the fire with nervous, energetic strokes, which seemed likely to put out the flames. His action, however, served to arouse Mr. Wade, who rose mechanically, reached for his shabby beaver hat, and with a low, "Good-night, Mr. Hicks," moved with slow, uncertain steps toward the door.

"No ill-feeling, I hope, Mr. Wade," said Mr. Hicks, following him. But the veteran suffered his nerveless fingers to rest for an instant in the strong grasp of the chairman, then silently opened the door and went out. He tottered down the steps, and fumbled several minutes at the gate before he could open it.

The news of his dismissal had come to Mr. Wade with cruel suddenness, and only by degrees did he recover from his half-dazed condition. Over and over, in mechanical fashion, he repeated Mr. Hicks' words—

"This, sir, is a progressive age. The majority are tired of old-fashioned doctrines, and desire a younger preacher."

They were tired of him, then; that was what it all meant, and there was no longer any use for him in the world. It would be so always, now; nobody would care for him, or look to him for aid. And the girls—his daughters—what would they say when they heard of it; how would they receive this news? With bitter reproaches, with stinging words, he knew; the thought sent a shudder through him. Yes, it would make things worse for him at home, and things were sorry enough there at the best. All through the dreary years since his wife's death the old man had been under the rule of two unmarried daughters, who made no effort to conceal the fact that their old father was an uncomfortable burden on their hands. They allowed him shelter and food to avoid town gossip, and added his meagre salary to the comfortable little income that they gained by teaching. But by continued taunts they succeeded in making his whole life sad and uncomfortable. Yet the old man always expected that some day he would come home

to find a kind welcome and loving words from them.

"They're Mary's children," he would say to himself. "Surely they must care a little for their old father."

But this dreary November night the old comforting assurance was no longer his. In the bitterness of this new pain he gave up all hope that he could ever be wanted anywhere.

With these thoughts in his mind the old man stumbled on, and at last turned in at the gate and reached the house that he called home. He stepped out of the cold and gloom of the night into the warmth and cheer of the cosy little hall. He paused for a moment, then as he looked up it seemed for an instant as if he were waking from a painful dream, for there in the doorway stood a winsome little maiden, who eyed him with childish curiosity. The old man was passionately fond of children, and his faded eyes grew wistful as he said, in quivering tones, "Come and see me, little one."

There was little in the gaunt old man, with his stooping shoulders, thin, spectacled face, and shabby, scanty, ill-fitting garments, to attract a child. But she started toward him, and was almost in his arms when a sharp voice cried: "Father, what right have you to touch her? Come away, Elsie dear." With these words Miss Harriet, the younger of the daughters, led away the child, and Mr. Wade was once more alone. The look of terror that stole over the child's face cut deep into the old man's heart as his daughter's cruel words failed to do. A slight moan escaped his lips, but, dreading a fresh rebuke, he choked back a rising sob and hobbled away into the darkness of his own room.

Half an hour later the little household gathered at the tea-table. Miss Wade, tall and stately, presided with cold dignity, and opposite her sat Miss Harriet and little Elsie, the daughter of a near neighbour, who had left the child for the afternoon. Mr. Wade took his seat, and reverently bowing his head, moved his lips in a murmured prayer of thanks. Instantly his daughters began a clatter of silver and china, while, in needlessly loud tones, they began to talk gaily on some amusing and trifling subject.

Little Elsie eyed the old man furtively during the opening of the meal, and fidgeted uneasily in her chair. She was a timid child, and Miss Wade's remark lingered in her memory.

"Will he hurt me?" she whispered to Miss Harriet, after some minutes.

"Why, you poor child! Does he frighten you? You'd better take your plate and cup into the kitchen, father. I don't wonder the child is frightened. You really are uncanny to-night."

So the old pastor was banished to the kitchen, there to eat his bread and drink his weak tea alone. He longed for a bit of meat for his supper, and a little cream and sugar for his tea. Once, months before, he had made bold to reach for the milk jug, but was stopped by the words, "Do you think we can afford to provide you with luxuries?" After that he did not offend in this way again, but to-night he watched, with almost a feeling of envy, the sleek, well-fed cat as she lapped her brimming saucer of creamy milk. Lucky cat! There was always enough food for her.

On his way upstairs a little later Mr. Wade passed the parlour door, and paused a moment to look in. The fire was burning cheerily in the grate, there was a cushioned chair before it, and on the table by the big lighted lamp was the evening paper. The old man hesitated. He was never allowed in that room, he knew; but the "girls," he remembered, had gone to take Elsie home, several doors away. And that paper, he was sure, had a long report of the conference held the day before. The temptation was irresistible. He sat down in the big easy chair and began to read. This weary old Christian veteran, his years of active service ended, yearned for news of the thousands of soldiers in the thick of the fight, and rarely did a paper or magazine enter his hands. That the work he so loved was still going on, he felt sure; but in his narrow, cramped life he longed for detailed tidings of the progress of the Church.

With glistening eyes he read, forgetting his sorrows. Half an hour had passed when a

hand drew the paper from his grasp, and his eldest daughter's cold voice said, "You forget that this room is not intended for your use." Miss Wade was never so abusive in her language as her hot-tempered sister, but her icy, sarcastic words were often quite as cutting. But to-night her father scarcely heard the words. He rose mechanically, and with feeble steps climbed the stairs to his chamber. There, in the bare, desolate room, with its bit of faded carpet and its scanty furnishings, shut out from the cheery little parlour with its fire, piano, books, and cushioned chairs, the old man spent the long evenings in dreary loneliness.

Sleep, however, brought unconsciousness, and with the morning came a new desire to live. It came—for so curiously does the trivial mingle with the tragic in this checkered life of ours—from an invitation out to tea! The invitation came from Mrs. Bickford, one of his parishioners, a rich widow and childless, and as full of whims and oddities as a woman can possibly be. Doubtless she had summoned him to say that his dismissal was richly deserved, reflected the old man, but, at all events, he should get a good supper.

Afternoon came, and Mr. Wade brushed his threadbare clothes, tied and retied his rusty necktie with stiff, eager fingers, and smoothed his thin locks with infinite pains. He was trembling all over with delight, this foolish old man, for it was many a weary month since anyone had invited him out to tea, and he was as pleased as a child at the prospect.

A little smile stole over the wrinkled face with its sad lines and furrows of care, and Mr. Wade decided, in this new, intoxicating pleasure, to say nothing to his daughters of the committee's decision until after his return from Mrs. Bickford's tea. So off he started, with something akin to briskness in his gait, and his head quite erect, as became a pastor invited out to tea by a wealthy member of his flock.

All through the meal, at which the parson was the only guest, the cheery little widow watched him narrowly with her sharp little eyes, gossiping gaily the while about this thing and that. And the pastor forgot his sorrows, forgot his shabbiness—yes, forgot his daughters even, and laughed his weak, quavering laugh which no one had heard for years, as he told long anecdotes of by-gone days.

The widow, it seems, had observed the old man for many months with mingled pity and indignation, and had come to a somewhat startling determination in her funny, whimsical fashion. To be sure she had been beset by a doubt or two, mainly in connection with her husband, dead some twenty years. But she was not a woman to hesitate long when she saw her duty plainly, and these doubts were therefore disposed of summarily.

So the old lady, in her crisp black silk gown and best lace cap, smiled on the shabby, sad old man, while she helped him liberally to the sweets on the table, and finally said—

"James Wade, you ought to be looked after, and the Lord says that I should do it."

The amazed pastor fairly gasped for an instant, but he had been ruled all his life by womankind, so he meekly murmured, "Yes."

"It is very lonely without a man about the place, and John, he is worthless unless there is a man to see after him. You and I, pastor, are old enough to do without talking about love, and the sooner we are married the better."

The widow drew a sigh of relief as she ended, to think that now the matter was all settled. The pastor wiped his spectacles, and said tearfully, "God bless you."

A little later, as they sat before the blazing fireplace, the pastor faltered out, "But what will the girls say?"

"Say?" responded the widow briskly. "Why, lots of things. Never saw them when they didn't. But we won't tell them till it is all over, and then let them talk!"

And so they were married. It was wonderful to see how soon Mr. Wade got accustomed to his fine broadcloth and his life of ease. Then, too, he never realised that the affectionate and almost obsequious manner with which his daughters now treated him was due to the change in his fortunes. The simple old man really believed that of which he had dreamed was come, and that his daughters had returned to their old, childish fondness for him.

# THE COOK AND HOUSEKEEPER.

## RECIPES FOR THE TABLE.

**GIBLET PIE.**—Line a baking pan with pastry, and fill with the livers of chickens or pigeons boiled in the water left from cooking, and mixed well with yolks of two hard-boiled eggs, celery chopped fine, parsley, thyme, sage, black pepper, and a little onion to suit the taste, one cupful of cream, and one spoonful of butter. Cover with pastry and bake. The gizzards may be used with the livers if the tough parts are removed, also the hearts of the chickens.

**STUFFED ONIONS.**—Parboil some good-sized onions. Take out the middles, and fill with force-meat. Place them side by side in a shallow dish with butter, and sprinkle a little salt and sugar over them. Cover the onions with thin slices of bacon. Cook thoroughly and serve in their own sauce.

**ALMOND BISCUITS.**—Beat half a pound of butter and half a pound of white sugar to a cream; mix with one pound of flour and one-fourth pound of almonds, blanched, and beaten to a paste with the juice of a lemon; work it well together, roll it out, and cut into small round cakes. Bake them in a quick oven.

**VEAL SOUP AND JELLY.**—Veal jelly, which is equally good hot like soup, or cold, is made by slicing a pound of veal very thin, and putting it in a closely-covered jar in alternate layers with sliced turnips. Add teacupful of water and a little sauce. Place the jar in a pan of water, and simmer gently for four hours. Strain before serving.

**FOR A WEAK DIGESTION.**—When an illness leaves a patient with a weak digestion, the following will be found light, wholesome, and nourishing:—Beat up in a basin a fresh-laid egg, add six table-spoonfuls of cold water and two of potato flour. Mix thoroughly, and pour as much boiling water over it as will make into jelly, stirring it well. Before serving a little milk and sugar should be added.

**SAGO PUDDING.**—The "old man of Tobago," who lived upon a sago, might have had his pudding in one or two ways:—First, boil one cupful of sago in a quart of water. Pour it over apples that have been pared and stewed a little, and bake half an hour. Or, if his doctor forbade apples, he might have four spoonfuls of sago boiled in a pint and a half of new milk, sweetened and flavoured with cinnamon, and baked slowly.

**MUSHROOMS WITH TOAST.**—Rub the tops of the mushrooms with a piece of flannel dipped in salt. Heat some butter in a saucepan, into which put the mushrooms with a little salt and Nepaul pepper; let them stew gently till the butter has almost disappeared, when add cream and the grated rind of a lemon. Let them simmer now only till done. Serve the mushrooms on cut rounds of fried bread, and squeeze some lemon juice over them.

**BROILED MUSHROOMS.**—Peel large, firm mushrooms, remove the stems, lay on a close gridiron over bright coals, turn, season with pepper and salt; take up on a heated dish, pour over melted butter with a little lemon juice.

**HOW TO PICK OUT A GOOD LOBSTER.**—If you examine a lobster that was alive when thrown into the boiler you will find that the tail is curled up to the body, while one that was dead has the tail extended. In buying lobsters this is a good thing to bear in mind.

To prevent the juices from exuding from fruit pies, press the edges of the pie smoothly together, and trim. Then take a strip of cloth an inch wide, and long enough to go around the edge and lap; wet it in cold water, and wind it around the pie, one half the strip lapping over the upper crust, the other half drawn below; then bake. In this way there will not be a drop of the juice lost.

"FOR THE BLOOD IS THE LIFE."—CLARKE'S WORLD-FAMED BLOOD MIXTURE is warranted to cleanse the blood from all impurities, from whatever cause arising. For Scrofula, Scurvy, Eczema, Skin, and Blood Diseases, its effects are marvellous. Thousands of testimonials from all parts. In Bottles 2s. 9d., and in cases containing 6 times the quantity 12s. each, of all chemists. Sent for 3s or 12s stamps, by the Lincoln and Midland Counties Drug Co., Lincoln.—[ADVT.]

**SWEET PICKLED CABBAGE.**—Shave thin, or chop fine, two small cabbages; add a teaspoonful each of powdered cloves, cinnamon, and allspice, two teacupfuls of vinegar, two teacupfuls of salt, a small teacupful of dark sugar, a pinch only of red pepper. Scald thoroughly all together. The cabbage must be cooked, not left tough. Stir constantly. Do not eat it for at least a week. Spices may be used "at discretion."

A STEW usually has vegetables and dumplings cooked with the meat. A haricot of mutton, or any other meat, is a stew with the meat and vegetables cut fine—the size of a haricot bean. A ragout is a stew highly flavoured with wine. A salmi is a stew of game. A chowder is a stew of fish. A fricasee is a form of stewing where the meat is fried or browned in fat, either before or after stewing, and is usually served without vegetables. A pot-pie is a stew with the dough put on as a crust. Braising is a form of stewing usually done in a covered pan in the oven. It gives a richer, stronger flavour than that obtained by stewing over the fire.

**ABOUT LOBSTERS.**—To open one, first wash and wipe it carefully, a desirable preliminary often omitted; break off the claws, and then the legs, being careful to draw out complete the feathery portion connected with them, which are the lungs of the creature. Then the shelly armour may be crushed and removed without breaking the meat, and the jointed protection of the tail taken off. With a knife, carefully cut along the rounded part, spread open with the fingers, and take away the intestine that will be found passing through it, and also the stomach. The soft greenish substance is the tomalley (what did the word come from?), and with the soft pinkish portion and the coral, or undeveloped spawn, is eatable, though some persons ignorantly reject what others regard as a *bonne bouche* which gives flavour and finish to the plain meat. Lettuce is the proper accompaniment for lobster.—For stewed lobster, put a pint of milk upon the stove to heat. Rub together a teaspoonful of flour and a piece of butter the size of an egg. When the milk is hot, stir in the butter and flour, and season with salt and pepper to taste. Chop about two pounds of lobster rather fine, and stir into the milk, letting it get thoroughly heated through. Just before sending it to table, stir in two table-spoonfuls of vinegar.—Lobster is nice fried like any other kind of fish. Take regular slices of the solid portion, and fry in hot butter or fat from slices of salt pork, which seasons it, and gives it a different taste from any other modes of cooking.—Some persons object to the use of oil in salad dressing. Let such try this excellent way: Beat the yolks of two eggs, take half a cupful of milk, teaspoonful each of mustard, salt butter, white sugar, half a teacupful of pepper. Put in a small saucepan, standing in a larger vessel of boiling water, and stir regularly. When cooked to the consistency of cream, add half a cupful of vinegar, then mix in the well-beaten whites of the two eggs after it is taken from the hot water. Five minutes is ample time to make it, though so many ingredients are called for.—The remnants of plain boiled lobster may be made into croquettes by being chopped or pounded fine, and mixed with bread crumbs and a little melted butter seasoned. Form them into balls, roll in egg, then powdered bread crumbs, and fry in boiling lard.—Or they may be scalloped, like oysters. Put into a buttered dish; spread fine bread crumbs and lobster in alternate layers, having the last layer crumbs. Add bits of butter, pepper, and salt; moisten with milk, and bake.—Still another approved way is to heat the chopped lobster in a little vinegar, with butter and seasoning.

**DIAGNOSIS.**—Mrs. Grumbleton—Oh, doctor! I'm afraid I swallowed my false teeth in my sleep! Dr. Wagg—Don't be alarmed, my dear madam. Do you feel a gnawing sensation?

TOWLE'S PENNYROYAL AND SWEET PILLS FOR FEMALES quickly correct all irregularities, remove all obstructions, and relieve the distressing symptoms so prevalent with the sex. Boxes, 1s. 13d. and 2s. 9d. (the latter contains three times the quantity) of all Chemists. Sent anywhere on receipt of 16 or 24 stamps by the Maker, E. T. Towle, Chemist, Nottingham. Beware of imitations, injurious and worthless.—[ADVT.]

## HINTS FOR THE HOUSEHOLD.

ONLY bright, happy, healthy subjects should be discussed in the hearing of a sick or ailing person.

DISTRESSING vomiting may be relieved by applying to the stomach a hot woollen pad brought from the oven.

The quickest way to treat a burn or scald is to cover it with oil and flour, and bandage with linen. In case of prostration from either accident administer a mild stimulant.

WHEN a delicate person is fatigued and has no appetite, sponging the body with bathing whisky, diluted alcohol or milk, will nourish the system and produce rest or refreshing sleep.

PLAINNESS IN TABLE LINEN.—Plain clothes, like a heavy satin cover in their damask sheen, are much affected now on fashionable dinner-tables.

BITS of camphor laid about closets where mice are wont to frequent will draw their visits to a close.

A ROOM with a low ceiling will seem higher if the window curtains hang to the floor. Lambrequins may be used to extend the curtains to the ceiling, and thus carry out the effect.

To erase scratches on varnished furniture, take a mixture of half paint oil and half turpentine, and with a cloth rub over them, and then rub dry with a soft, clean cloth.

A VERY complete filling for open cracks in floors may be made by thoroughly soaking newspapers in a paste made by one pound of flour, three quarts of water, and a table-spoonful of alum, thoroughly boiled and mixed. Make the final mixture about as thick as putty—a kind of paper putty—and it will harden like papier-maché.

A TIMELY TABLE.—The following table gives the length of time required for cooking fruit:—Cherries, five minutes; currants, blackberries, raspberries, six to eight minutes; gooseberries and halved peaches, ten minutes; strawberries, fifteen minutes; whole peaches, twenty minutes; halved pears and quinces, twenty minutes; sliced pineapple, twenty minutes; crab apples and sliced pears, thirty minutes.

BEAUTIFUL CHINA.—A full set of silver plate used to be considered the height of luxury in the way of table service, but in these days of exquisite china, when it is an easy matter to spend £100 for a dozen porcelain plates, silver in this form is relegated to an inferior place, and, like the heavy old four-post bedstead, becomes attractive only when it is an heirloom. However, the collecting of beautiful china is not entirely a modern fashion. That extravagant lady, Catherine the Great of Russia, not contented with her massive service of gold, had made in France for the Imperial table, several dozen plates painted by distinguished artists of the time, for which she paid about 4000 roubles a plate. French works of art were made to do the duty of dinner plates, upon which, no doubt, was served plenty of tartar sauce.

SURGEON SAID:—To keep debt, dirt, and the devil out of my cottage has been my greatest wish ever since I set up housekeeping. Surely these form a trinity of evils that should be carefully guarded against. A man who is in debt is a slave, toiling to meet the demands of another. He cannot call what he possesses his own. He had better a great deal have less, and "owe no man anything," according to the apostolic injunction, than to have large possessions for which he is responsible, but which in whole or in part belong to another. A man in debt is like a person overboard with a great weight about his neck, with which, by great exertion, he may reach the shore, but which, nevertheless, may sink him at any moment. But whatever excuse may be made for men going into debt, surely none can be offered for their living in dirt. Soap and water are cheap, and brushes and brooms are not very expensive.

"The Family Doctor will be found of great use in every Household."—*Sportsman*

# THE MOTHER'S PAGE.

"OH, don't do that!" many a mother exclaims, even to her children who are young men and women grown. It seems to make little difference what they propose to do, for the habit of years on the part of the mother, growing out of fear, ignorance in the care and education of her children, and an unwise solicitude has made this expression involuntary—a sort of wet blanket upon every innocent and spontaneous desire frankly expressed. Such mothers are no doubt faithful and conscientious, indeed they are fidelity itself, but this does not take the place of right knowledge. Notice how soon the habit of deception is formed by children who continually feel the mother's repression, how it separates parents and children, and finally leads to the saddest results. "Don't say anything about it before mother, she'll be sure to put a damper on it," said a young girl to her friend of a proposed course of action perfectly proper in itself.

That mother had pitifully defrauded herself, as well as her children, and in consequence had no one but herself to blame for the result. If from early childhood she had been in the habit of considering matters with them, if she had talked over their little plans and hopes, showing an interest in what to them is of so much importance, how different in maturer years their relations to each other might have been, how much more happiness might have been assured for both.

Dear mothers, if you hope to become the trusted and beloved friend, the companion of your children in later life, don't say "Don't" to the children except when it is unavoidable.

\* \* \* \*

A WISE father or mother will not do for children the many things which they should be taught to do for themselves. Simple justice to children requires that they should be put upon their own resources. "My papa never allowed us to say I can't," remarked a young girl, who, in spite of many obstacles, was learning to sing. Blessed are the fathers and mothers who banish "I can't," and who encourage their children to believe that they can. "I never learned to cook," said a grown woman "because my mother thought I would make too much trouble in the kitchen." That mother saved herself some annoyance perhaps, but she had deprived her child of its lawful due. The child's desire to learn should be gratified, and the mother should gladly give these early lessons, thus helping the child to help itself. Children need guiding, and this is the mother's happy province. No greater cruelty can be devised than to bring children up with the expectation that everything will be done for them, for this is to create a class of dissatisfied, helpless dependents, of no use or comfort to themselves or anyone else.

\* \* \* \*

## ONE DAY IN A MOTHER'S LIFE.

THERE is no class of women under the sun who so need to be coached in regard to hygienic principles of rest as mothers. Ah, how heavily the cares of life press! So heavily that even the longest day in the year refuses to furnish that one precious half-hour which, if devoted to rest, will save a woman's good looks and vitality from premature decay.

Why, hygiene, these days, is as much of a fad as the souvenir spoon. Wise ones are very wide awake to this fact, and as a result those delicate nerve centres, upon which we women depend for womanly comeliness and sweetness of disposition, are, as far as possible, carefully looked after.

The sister does not live who can be at her best when fagged to death. No matter how clever the patents used to run the domestic machinery, the wear and tear tells, and in a way to bring to the front unpleasant little gusts of temper that might be easily controlled were it not for an overtaxed system.

STEEDMAN'S Soothing Powders for Children putting their teeth have now been in use over fifty years. They relieve feverish heat, prevent fits, convulsions, etc., and preserve healthy state of the constitution during the period of teething. Manufactured only at Walsworth, Surrey. Sold everywhere please observe the *W.N.* in Steedman—Advt.

Rest, if only thirty minutes a day. Give the tired nerves a chance to relax. This is a duty which you owe, not only to yourself, but your family as well.

Rest by all means—rest, if you have to filch from the day's duties the thirty minutes for repose. Surely, somewhere in between the flying hours they may be sandwiched.

What the average woman needs is a nook all her own, in which will be found the softest of divans, the downiest of head-rests, and a light so tempered that it will aid in wooing the god of sleep.

You need not hesitate to accept this luxurious idea on account of the cost, for even a slender purse can surely afford a plain little cot. This gives you a comfortable beginning. When a thin hair mattress and a pretty cheesecloth cosy have been added, along with a trio of denim-coloured pillows, you will, I feel certain have secured a very strong incentive for following my advice.

The home which owns the fairest, the freshest-looking, and the best-natured wife and mother, is always supplied with cosy corners. Now comes the question. Do you know how to rest? Not one woman in a hundred does.

How often one hears the remark: "I do most of my thinking and planning when lying down."

Could anything be more exhausting? The trouble is this: Every moment given to so-called rest seems to the busy soul just so much time wasted.

There are so many tasks waiting their turn. And how they march and counter-march before the half-closed lids! Thump, thump! beat, beat! There is a regular trip-hammer movement going on in the base of the brain. It is discouraging—so discouraging that you give up the struggle.

What is needed is a first-class method for "shutting down the thought valves of the mind," as someone puts it. Close down your mind like a water-gate. If you cannot do this, place near your couch something that will turn your thoughts into a more soothing channel. A big, branching palm or a few cool, feathery ferns are restful. Banish, with what will-power you possess, harrassing details. The first trial will no doubt be a failure, but after a time you will gain better control of your mind, and some fine day you will discover that this little way-station along life's road is doing more for you than all the balms and lotions in the universe.

\* \* \* \*

## DON'TS FOR WIVES.

BY A HUSBAND.

DON'T talk too much about what "lovely times" you used to have when you were "free and single," or your husband may wish that you were so at the present time, and it is a sad day in the life of any wife when her husband cherishes that opinion regarding her. It is a sadder day still for him.

Don't treasure up all of your daily trials for your husband's ears when he comes home at night.

Don't tell him how bad the children have been, or how hateful the girl has acted, or how the clothes-line broke with the week's washing on it, or how the baby has cried all day, or how badly the ironing has been done, or how the milkman left milk that soured in an hour, or how the grocer has sent bad eggs for good ones. Don't add all these things to the trials your husband has borne all day. He has had his trials, you may be sure of that, and unless he is an exception to the general rule, he has not said anything at all about them to you.

Don't "nag" at him all of the time. That is the hatefulest little word I know of, and the "nagging" practice is one of the most vicious. Much should be forgiven a husband who has a "nagging" wife—one whose tongue is never still and whose every word is of fault-finding or complaint. Such a woman is a blot on the fair face of creation, and her husband has much to bear. Whatever else you may do, don't nag your husband.

Don't compare him to other men to his disadvantage. Don't tell him that you "do wish" he were like this woman's or that woman's husband. Nothing can flatter him so much as your openly-expressed conviction that you have the best and kindest and handsomest husband in all the world. No doubt you told him so once, and even if you think differently now, nothing but harm can come of your telling him so.

Don't go around slipshod and slovenly before your husband. He may not say anything about it, but it will have a demoralising effect upon him all the same. Don't come to the breakfast table with your hair in crimping pins because you are going to town later in the day, and the crimp will all come out if you take your hair down before breakfast. Your husband won't see you when you are in town, and he does see you now, and wouldn't you rather look your best before him than before any other man in the world? The time has been when you would have been "mortified to death" had he caught you with your hair in crimping pins.

Don't ask him to be both master and mistress of the house. Don't ask him what you shall have for dinner or burden him with all of the family marketing. Don't expect him to oversee your servants or to do things that you, as mistress of your own home, ought to do. He probably has his hands and his mind full.

Don't look for perfection in your husband. He has not found perfection in you, has he? Perfect men are so rare in this world that if one could be found he would be worth his weight in gold, and perfect women are equally rare. If your husband is "as good as the average" be thankful that he is no worse, and bear in mind that it rests largely with you whether he grows better or worse.

Of course nearly all of these "Don'ts" apply to husbands as well as to wives. Men are no better than women, nor as good—they have their failings by the score, but don't increase their shortcomings by showing them the weak tide of your own characters.

\* \* \* \*

SLEEP, O my darling, sleep,  
Safe folded are the sheep;  
The faint stars lie in the quiet sky,  
The soft wind croons thy lullaby;  
The leaves upon the linden tree  
Are whispering tenderly to thee,  
And close at hand lies Slumberland,  
O sleep, my darling, sleep.

Wake, O my darling, wake,  
The sunbeams kiss the lake;  
The seagulls fly to the eastern sky,  
The happy ships are sailing by;  
The birds upon the linden tree  
Are calling merrily to thee,  
The whole glad earth is rimmed with mirth,  
O wake my darling, wake.

EMIGRATION.—Too crowded indeed! Meanwhile, what portion of this inconsiderable terraqueous globe have ye actually tilled and derved till it will grow no more! How thick stands your population in the Pampas and Savannahs of America; round ancient Carthage, and in the interior of Africa; on both slopes of the Altaic chain, in the central platform of Asia; in Spain, Greece, Turkey, Grim Tartary, the Curragh of Kildare! One man, in one year, as I have understood it, if you lend him earth, will feed himself and nine others. Alas! where now are the Hergists and Alarics of our still-glowing, still-expanding Europe, who, when their home is grown too narrow, will enlist, and like fire-pillars, guide onwards those superfluous masses of indomitable living valour: equipped, not now with the battle-axe and war chariot, but with the steam-engine and ploughshare? Where are they? Preserving their game!!—*Curlyte.*

TO TOBACCONISTS (commencing).—*Illust. Guide*, 239 pages. "Post Free." How to Commence, £20 to £1000. Tobacconist's Outfitting Co., 181, Euston Rd., London. Manager, H. Myers. Est. 1866. Smoke "Pick-Me-Up Cigarettes."—Advt.

[SPECIAL ARTICLE.]

## CARE OF THE FEET.

BY A STUDENT.

A HUMAN foot, when graceful and proportionate in its outlines, and neatly dressed, is one of the most comely members of the body—as well as one of the most useful. Like other portions of the anatomy, the foot varies considerably in size with different individuals of the same general weight and build, but the average shows that for a well-proportioned man of six feet, weighing perhaps 180 pounds, the foot will measure 11 inches in length, and will fit comfortably in a No. 9 shoe. Occasionally a man nearly six feet in height will be found with a foot small enough to wear a shoe not larger than No. 4, though the smallest men of normal proportions rarely use a shoe more than one or two sizes smaller; while the largest foot on record, which measured 20 inches, would have filled a No. 36 shoe. The average size of a man's foot, however, is about 10½ inches, requiring a No. 8 shoe. Among women, the average length of the foot is something more than an inch less, and the shoes are correspondingly smaller, though it is not safe to rely wholly upon the old rule that the length of a woman's foot is one-seventh of her height.

In many cases there may be said to be national traits or peculiarities of the feet, and, by common consent, to the Spaniards the award of the most beautiful feet must be made. The Spanish foot is very slim, with long toes, small heels, and the graceful arch of the instep, without which the most perfect outline is faulty. The French foot is larger, but it has the arch of instep and pointed toes, which, when properly fitted in the shoe, gives the impression of a much smaller member. The Germans have broad feet, though well arched, and the English foot may perhaps be called a cross of the French and German, being broad at the ball but inclined to the narrow toe. The Irish foot is short and thick, with little arch, while that of the Scotch is large, bony, and broad.

Taking into consideration the delicate nature of the human foot, the great number of small bones, muscles, tendons, and nerves, with the trying usage to which they must inevitably be subjected in the course of the ordinary life, it is apparent that the greatest possible care should be exercised in the proper treatment and preservation of these indispensable members. Nor should this painstaking be deferred to adult life, when the wearer of the feet is often awakened to the fact that irreparable mischief has already been wrought. With the delicate muscles once paralysed, the bones and joints demoralised, malformations begun, there is no prospect ahead but that of a partially-crippled existence, accompanied by more or less of torture and mortification. Nor is the general health so often attacked and ruined as through the feet—especially in childhood.

It is the part of the wise mother, then, to carefully watch the feet of her little ones during their tender years. "Keep the head cool and the feet warm," is a faithful admonition, especially adapted to the children. With many woollen stockings should be avoided altogether, especially when they cause itching or sweating of the feet. Perspiration will be absorbed by the wool, making of the stocking a cold, clammy mass, more to be dreaded than the most tempting "mud-puddle." Equip such children with firm, substantial cotton hose, providing woollen anklets or leggings, if thought best, and their feet will be warm and dry, except for outward wetting.

When this happens, whether in child or adult, the wet garments should be promptly removed, the feet bathed—if possible with lukewarm water—and vigorously rubbed till dry. Where this is promptly done, dry shoes and stockings being put on, there is little danger of serious results. Care in keeping the feet warm and dry is very much better than muffling the throat and neck. Too often it happens that a thick muffler is laid aside, the child steps into a draught of air, the perspiration is checked, and deadly lung or throat troubles follow; whereas, had the throat been but lightly covered, the strong circulation of

the blood naturally keeping it abundantly warm, with the extra attention devoted to the feet and lower limbs, where the circulation is least vigorous, there would have been no danger of colds or more dangerous maladies.

While the child's foot is immature, with yielding bones and tender muscles, it is of the greatest importance that care be exercised in all that pertains to the shoes, if serious trouble in later life would be avoided. The shoe should fit properly, being neither too large nor too small, and the child should be taught to walk firmly and squarely upon it; as soon as there are signs of the heel "running over," the aid of a cobbler should be invoked, or a new pair procured. More is meant by the "fit of a shoe" than is often realised. Unless the hollow of the foot is fitted, there is a constant tendency to break down the arch, making the foot flat and the owner miserable; and the graceful contour, once destroyed, can never be wholly regained. In mature life, except in case of disease or debility, the muscles may be trusted to maintain the true proportions.

There are a few common diseases of the feet which are annoying and sometimes painful, for which the services of a physician or a chiropodist are scarcely required, since the intelligent individual can generally treat them quite as effectually. Above all, ignore the peripatetic "corn doctor." If the trouble is serious enough to require skilled attention, better employ the family physician, whose business it is to understand the ailments of the human system. If he is unable to effect a cure, the applicant will at least be safe in his hands.

Corns are the most nearly universal disease of the feet, and a word about their prevention may well precede anything regarding their removal. In the first place, a frequent and thorough bathing of the feet is one of the best possible (though not an infallible) preventive of corns. Sometime during each twenty-four hours, summer and winter, the feet should be bathed thoroughly, and when there is a tendency to sweat or they are subjected to hard usage, a night and morning bath is preferable. But the hard-working man or woman may think this too great a waste of time. It will not require many minutes to bathe the feet thoroughly twice a day, for the task is comparatively light when performed at short intervals; and to say nothing of the added comfort, the prevention of diseased conditions is well worth all the time and trouble. The feet require soap and water as much as the face and hands, and an argument against one may with equal force be made an argument against all.

Feet thus bathed will be comparatively free from corns, bunions, and callouses, dead and wrinkled skin will be unknown, and disorganised nails a rarity. Still, it is a fact that corns occasionally baffle all known preventives, and put in an appearance under the most forbidding conditions, and in the most annoying and provoking positions. As they are due to certain pressure exerted by the boot or shoe, they may sometimes be smothered in infancy, so to speak, by a change of foot-wear. Having several pairs of shoes, and changing them daily or regularly at longer intervals, will enable the wearer quite frequently to avoid corns, even after they show signs of formation.

Where remedies become necessary their name is legion, and some of them will usually be found effective. If one does not answer the purpose, try another. In the early stages of corn growth, paraffin oil is recommended. Pare down the hard part as much as possible, and apply the oil night and morning. If between the toes, saturate a piece of tissue paper, cloth, or felt, and wear it, with daily renewals. In most cases a hard corn can be easily removed with a knife, without pain or blood-letting. Do not pare it, but when the kernel is dry and hard find the edge of the indurated portion and pass the point of a small knife between the hard substance and the live skin beneath. Use the back of the point of the knife—not the edge, which would be liable to wound the tender flesh under the corn. Press the knife very gently under the corn, lifting it slightly and drawing the blunt point toward you. If the root of the corn runs down into the flesh, it should be carefully followed with the knife, and though the spot will be tender, there will

be no pain worth minding in the operation, and the relief of having the kernel removed will be very grateful. Rub the tender skin with a little vaseline and the task is done. Soft corns cannot be coaxed from their beds in that way.

Ingrowing or malformed nails are very painful sometimes, and while rare where proper attention is given to bathing the feet, trimming the nails, and selecting proper-fitting shoes, they sometimes, like corns, appear without any apparent cause. Where the case is serious, it is better to consult a physician; but if taken in time the growth may be checked in this way: Soak the nail, and scrape the central portion quite thin. The corners may then be lifted somewhat from the flesh, and a small quantity of lint pressed into the crevice.

Thin strips of adhesive plaster may be applied to draw the irritated skin still more away from the nail, and in a few days the trouble will probably be remedied without other treatment, while the application of a soothing ointment will banish the soreness.

There is another affection of the feet, not quite so general as the above, which is, nevertheless, quite as aggravating, and in some respects more annoying, and that is sweating. If there is simply a tendency to perspiration, frequent bathing and changes of foot-wear will be especially necessary. In such cases the addition of a small quantity of ammonia to the water will be found beneficial, and if there is excessive tenderness—which is very apt to be the case—weak alum water may be applied. An application of cologne, bay-rum, or diluted alcohol is also helpful. Powdered chalk and starch are also recommended, especially where there is a tendency to chafe and blister.

(To be continued.)

## DRESS AND HEALTH.

ALTHOUGH it is true, as shown by actual investigation, that tight-lacing is, on the whole, on the increase, yet in the days of independent thought and action—we might better say, in these days of the better education of women—we find many who dress perfectly hygienically. While some of these are still suffering from the results of transgressions committed when they were young and foolish, or before they knew any better, it is interesting to the physician to note how much more readily these yield to treatment when ill, how much clearer the complexion, and how much more graceful the carriage in health! These facts are so marked that they can scarcely escape notice from even the most casual observer.

It may be interesting to know some of the reasons for the great advantage this class have in point of health and beauty. Were we to speak of all the reasons, volumes would have to be devoted to the subject, for there is no organ or tissue of the body which is not directly or indirectly affected by our manner of dress. The walk cannot but be more easy, and hence more graceful, when the muscles of the trunk are free, the hips unburdened by the heavy weight of clothing, and the feet comfortable in broad soles and low heels. If thought be given to the position to keep the shoulders and hips well back, the spine curved forward, the head erect, and the chin dropped, and in addition to this, if pains be taken to develop the muscles of the trunk so that they can carry the upper part of the body erect with ease, one can scarcely help developing a graceful carriage. The complexion is fresh, the hands white, and the cheeks ruddy, because—

First, there is no interference with the circulation, damming back the impure blood in the veins, and making the hands blue and bloated, the face coarse and red.

Second, there is spacious lung surface, where the blood can unload its burden of effete matters, instead of depositing them in the skin. Here, too, it can take on a large quantity of oxygen with which to tint the cheeks, and burn up the rubbish lying about in the tissues, rendering the skin dark and sallow.

Third, the digestive organs have room in which to do their work, which, if not otherwise abused, can furnish good, well-prepared building material. Those who would be beautiful, and think to become so by showing spite to the

Creator of the human form divine, fall sadly short of their purpose, and that in consequence of their own misapplied taste.

[SPECIAL ARTICLE.]

# ORIGIN OF GRAVEL.

By "LANCET."

[T used formerly to be told us that a beautiful maiden, having a wealth of kindness, received, for a glass of water offered to a fairy who was thirsty, the gift of scattering from her lips roses of precious stones of great size and of various compositions. In no respect altered, but altogether degenerate, we still produce stones, but they are not very precious; they are, in fact, the common calculous. These calculous secretions are found nearly everywhere, our bodies seem inexhaustible quarries, whose wretched materials are destined not for the repair of our corporal edifice, but for its destruction.

This faculty of sowing in our organs gravel and stone is called *uric acid diathesis*. We may suppose that our body, a furnace always ignited for the duties of life, draws badly, it receives an excess of nutritive matter, and there forms in the blood as a result of albuminoid substances imperfectly assimilated the elements of these stones.

It is the excess of receipts over expenditure that is the evil with rich, sedentary, or inactive people; but there is a uric acid diathesis among poor people, in the case of those who take up their nutriment badly, allowing mineral matter to be deposited in their economy.

In the two cases besides there is perversion of nutrition, the mechanism of which we cannot grasp. Not to dwell upon this any further, let us enter into the heart of the subject. The most frequent manifestation of calculous diathesis is gravel. The kidney is as much the "sewer" of the body as the urine, which traverses it, carries off all the refuse, albumen, sugar, gravel, &c., and reveals all its ills. The salts which the urine carries deposit themselves either in the kidneys or the bladder, under the name of infarcts, sand, gravel, and calculi.

Gravel is then the production of the body resulting from the urine, and is of variable shape, size, and composition.

In practice one may distinguish three kinds of gravel. First, the calculi are hard and of a reddish colour, this is gravel formed of uric acid and urates. Second, the calculi are brown, hard, and nodulated like a raspberry; it is oxalate of lime that gives them this appearance. Third, the white, or grey, and friable calculi are formed of phosphate of lime, or the triple phosphates.

By far the most frequent, the uric acid or red gravel is found chiefly among the inhabitants of towns and among rich people. This gravel is a rear relative of gout, diabetes, obesity, and all the evils of the rich, consequent upon inactivity and the abuse of all kinds.

The most common causes of red gravel are heredity, digestive troubles, excess of food, insufficient exercise, violent moral emotions, and blows or wounds in the region of the kidneys.

Heredity is the most frequent and most cogent cause of uric acid gravel, and this hereditary gravel respects neither the child nor even the new-born infant. One sometimes finds red gravel in the urine of very young children; they suffer acute colic at these times, during which they vomit and utter shrill cries.

Troubles of the digestive functions also often provoke uric acid diathesis. A dyspeptic ends by having red gravel, but the gravel in his case disappears when the state of the stomach amends.

Excess of food is the cause, if not the surest, at least the best known of uric acid diathesis, and it is gravel which venges itself upon the rich. Doubtless an exclusively animal diet, a choice and tempting cuisine may prove dangerous, but an excess of wines, liquors, and brandy are otherwise highly favourable to the production of uric acid.

The safe and heavy bordeaux is the only exception to this rule, but avoid sparkling

moselle, champagne which comes to a head in the glass, burgundy of a purple-brown hue, Spanish wine sweet and full of alcohol, strong and intoxicating English beer, or even cider, if it is old and not a customary beverage.

Heavy substances are equally in the long run favourable to the production of gravel. Asparagus, congesting the kidneys, favours the agglomeration of gravel, French beans, sorrel, and the tomato constitute dangerous foods for predisposition to this complaint. Insufficient exercise is again a powerful cause of uric acid diathesis; a person suffering from gravel may be a man of perfect sobriety, condemning himself to the most severe regimen, if he does not by muscular exercise, proportionate to his years, completely "oxydise" the nourishment he takes, he is condemned to remain a sufferer.

Violent moral affections, vivid emotions, fits of passion, &c., may bring about the hasty appearance of gravel in the urine, an accident of persistent recurrence if the humour is continued.

Lastly, blows or injuries in the region of the kidneys, may provoke gravel more or less lasting.

Gravel produces pains of variable intensity in the region of the kidneys, often a simple aching consequent on walking or riding. If the stones are large, their expulsion may give birth to a violent crisis, nephritic colic—a rare occurrence, however, which might attack one patient in a hundred.

The emission of blood in the urine, on the contrary, is frequent enough in cases of passing red gravel. In white gravel there is no blood with the urine, no violent crisis, but the pains, although less acute, are of longer duration.

There is not yet known a successful remedy to meet the calculi collected in the kidneys and deposited in the bladder. What has not been tried? Someone has favoured the injection of warm blood from the fox or goat, and the urine of the goat taken as a draught—what strange remedies! The blood of the pig, or the boar, the brain and kidney of an ass taken in wine, the powder of the glow-worm or the ordinary worm, crickets, locusts eaten with bread, the flesh of the hedge-hog, grasshoppers, the liver of a hydia, &c., all these ought surely to dissolve gravel and stone.

Better advised, we have returned to a very simple regimen: A diet chiefly of vegetables, exercise, the removal of the ordinary causes of gravel, such are the precautions we commend to you.

Nephritic colic should be treated with vigour, the thing is to soothe an intolerable suffering as quickly as possible. Sparse cupping, mustard poultices, leeches, crushed ice applied in a bladder upon the painful place, the local application of hot cloths, hot irons, pure chloroform on wadding, a mixture of chloroform, soothing balm and laudanum; such are the external means which ought to be applied at once.

If the pain remains active, one should use injections of laudanum or chloral, or chloral and morphine as a draught. A subcutaneous injection of morphine five to fifteen milligrammes renders signal service.

As a last resort, one has recourse to inhalations of ether or chloroform, a dangerous means, which must be avoided if possible.

The gravel which is the cause of nephritic colic is expelled at the same time as the urine, usually from six to twenty-four hours after the crisis; one exceptionally sees voluminous secretions remaining in the bladder two or three months before expulsion.

The calculi brought down from the kidneys into the bladder may give rise to *stone* by means of the addition either of elements of the same nature or deposits of a different kind, the abuse of strong alkalines. Bicarbonate of soda, mineral water, alkalines, &c., may hasten this formation.

To sum up, one ought to rid himself of gravel, because of its possible consequences—Nephritic colic, renal hæmorrhage, and formation of stone—but to treat it chiefly by exercise and diet.

"For years he was well known to me,"

So the physician sadly said,

"But now, called to his autopsy,

I am obliged to cut him dead."

## NURSING IN WORKHOUSES.

[T is to be hoped that the conferences of lady guardians lately held, in reference to the nursing of the aged and infirm inmates of the workhouses, will have some good effect, and will not be allowed to lapse until some real improvement is made in the lot of a most long-suffering class. To be really ill in a workhouse infirmary is one thing, bad enough no doubt, although often mitigated by good nursing and kind attention, but to live in a workhouse itself and suffer the aches and pains of chronic ailments, and struggle against the feebleness and decrepitude of age unhelped and uncared for, is quite another and much worse thing to bear. At the meeting held on October 23rd, under the presidency of the Countess of Meath, Miss Twining read a Paper on the subject, and deplored that the arrangements for the care of the poor were not on such kindly lines as abroad, where sisters and deaconesses were always available for the work. A resolution, proposed by Miss Twining and seconded by Mrs. Shaen, was adopted, to the effect that "it is desirable to form an association for providing trained attendants for the aged and infirm inmates of workhouses as distinct from trained nurses of sick wards." Before the meeting separated Lady Meath promised to pay for the training of the first six attendants.

It must not, however, be imagined, because of the efforts made to extend the benefits of good nursing to the aged and infirm as well as to the sick, that these latter now have all that is proper in the way of care and attention. Since the legislation which led to the erection of separate infirmaries by the metropolitan parishes and unions, the sad lot of the sick poor in London has been immensely alleviated. Anyone who will refer to the reports for 1865 and 1866 by Mr. Ernest Hart and the late Dr. Anstie describing the condition of the nursing in the sick wards of the workhouses in those days, and will then visit one of the modern separate infirmaries, such as the one at Notting Hill, will see what great strides have been made in bringing modern methods to bear on the treatment of the pauper sick. But it is otherwise in the provinces. A few large towns have put up splendid poor-law infirmaries, but in the majority of country places the sick are still treated in workhouse sick wards much on the old lines. Even in London, however, things are not as they should be. The existence of the great rate-supported infirmaries is apt to encourage a certain sense of pharisaic pride and satisfaction, not entirely well founded. We Londoners are not as dwellers in other towns; we treat our pauper sick in separate infirmaries with trained nurses and proper nursing appliances. Do we? That is just the question.

According to a return presented to the House of Commons in 1891 the metropolitan separate infirmaries and sick asylums (not including the Asylums Board Hospitals) provided 12,464 beds for the sick. This seems an immense number, but according to the same return there are still 5832 beds in sick wards remaining in metropolitan workhouses, the nursing of which is on a very different footing from that which obtains in the better separate infirmaries. Whether it is due to the growth of London, or whether it is that the separate infirmaries, with their better appliances, have drawn to themselves a class of acute cases which formerly were treated at home, the fact remains that the separate infirmaries which were instituted with the object of clearing the sick out of the workhouses do not supply sufficient beds for the purpose, and that there are still upwards of 5000 left within the workhouse buildings.

Again, inquiring from the same return as to the ratio of paid nurses to sick beds quite irrespective of whether they are trained nurses or not, we find how poorly off the workhouse sick beds are compared with those in the separate infirmaries. Paddington, for example, has one paid nurse for every 10·1 sick beds in its infirmary, but only one to every 33 in its workhouse; Chelsea, 1 to 11 in the infirmary, 1 to 28·1 in the workhouse; St. Pancras, 1 to 14·9, against 1 to 23·6; St. Marylebone, 1 to 14·8, against 1 to 20; Holborn, 1 to 17·3, against 1 to 36·2. This is sufficient to show what we wish to draw attention to—namely, that outside

"The FAMILY DOCTOR. Truly an Astonishing Pennyworth."—Knowledge.

and beyond the sick who are, as we fondly hope well treated in the specially-built separate infirmaries, there is a great mass of sick who have never got into these havens, and still remain in the old workhouses. Nor can we feel quite happy regarding even the separate infirmaries: the old feeling as to the management of paupers dies hard, and so long as a great metropolitan parish like Islington only affords one paid nurse to every 341 patients in its infirmary, we cannot feel that the sick poor always get proper nursing even in these great institutions. There is a great opening yet for philanthropy and reform in our dealings with sick and aged paupers. Lady guardians and visiting committees with right of entry would throw a flood of publicity on the inner working of our poorhouses, and might greatly lighten the lot of many of our poorer neighbours who have fallen by the way.—*British Medical Journal*.

## CORPORAL PUNISHMENT IN SCHOOLS.

AFTER considerable experience of childish misbehaviour, and of moral and physical methods of chastisement, public opinion, as represented upon the School Board, has arrived at the decision that corporal punishment may be administered by duly qualified and prudent schoolmasters. Though we do not admit that corporal punishment is at all indispensable to the educational armamentarium, yet as long as juvenile human nature continues to be what it is, we may expect that its instincts and inclinations will, in a great many cases, prove to be too strong and wayward for mere moral suasion. We find this wilful tendency even among the educated and in the adult. To expect more self-control or more intelligence in children would be unwarranted presumption. We can, therefore, support unreservedly the very moderate motion passed at a recent meeting of the London School—namely, that head teachers should be allowed to administer punishment when necessary, and also to transfer the right in respect of "slight" punishment to properly qualified assistants. Without an arrangement of this kind the authority of a teacher is limited to mere remonstrance, a means of control which many children would not understand, and which others of them would laugh at. If teachers are appointed to maintain discipline we must in reason and in very decency trust them. We should, for our own part, wish to have some definite interpretation of the term "slight punishment." We presume that it would be merely a punishment sufficient for its intended purpose. Floggings, in the ordinary sense of the term, such as were common in the time of Nicholas Nickleby, are now, of course, utterly unheard of in the days of the enlightened and highly-trained teachers into whose care the education of the "rising generation" is entrusted. Such forms of maintaining school discipline excite as much contempt in the mind of the present-day schoolmaster as the proposal to bleed a patient suffering from typhoid fever would do in the mind of the present-day physician. Some further information on the subject of methods is in any case desirable, but we imagine that there need be little doubt that schoolmasters, having now more though not unqualified liberty in the matter, will use discretion in the choice of time, means, and points of application.—*Lancet*

ARISTOTLE mentions a woman who had five living children at a birth four times successively. Menage tells of one who had twenty-one children in seven years.

ABOUT THE KORAN.—The Koran, the sacred book of the Mohammedans (usually spoken of by Oriental scholars as the "Alcoran"), was composed by Mohammed (Mahomet), and is said to have originally been written upon the bleached shoulder blades of sheep. The first edition contains 6000 verses; the second and fifth 6214; the third, 6219; the fourth, 6236; the sixth, 6226, and the seventh, or "Vulgate" edition, 6225. The words and letters are the same in all editions, viz.: 77,639 words, and 323,015 letters. The George Sale (common English translation) is divided into 114 chapters.

## PHYSIQUE AND CHARACTER.

By J. S.

PHYSIOGNOMY is a science of observation. Study based upon observation is attractive and easy; one can give himself up to it anywhere, in spare hours without preparation, according to circumstances. This kind of work exacts neither hard application nor the silence of the study, it is often even in the midst of an excited and noisy throng, that one encounters the most valuable elements of investigation and gathers the most useful notes.

I have always had a marked predelection for this kind of investigation. First, I made observations to occupy my attention from pure idleness, and without any preconceived idea; then, little by little, I made comparisons, and drew deductions from these comparisons, and so I ended by setting up a code of rules, which experience has completed by confirming.

There are certain observations on traits of visage, nose, mouth, eyes, ears, chin, &c., which I propose to set forth here; I shall give them just as I have gathered them, briskly engaging my readers to arrange them by their own personal experience.

There is nothing so recreative as the work of compiling and investigation, which unfolds at every step fresh peculiarities.

There is nothing at once so instructive and amusing as these comparisons, comparisons which quickly teach one to make ready use of *Analogy*, that operation of the mind by means of which one penetrates so easily, and without effort, into the most arduous branches of science.

In the street, the theatre, concert or drawing-room, as one lounges at the cafés or on the promenade, when one pays a visit, gets on top of an omnibus or into a train, everywhere are presented to us inexhaustible subjects for study upon which to exercise our talent.

It is sufficient to look around, in order to gain by practice such confidence in the means with which this art furnishes us, when it quickly becomes a guide in all social relations.

"That man does not please me, notwithstanding that he has never done me the least ill; but before he comes, I ought to break with him!" said Jean-Jacques Rousseau.

Nothing more just or true! As soon as we are in the presence of one of our fellow creatures a sensation takes hold of us; instinctively we feel that beneath that material covering, there is a soul, of which the form before our eyes is the faithful interpretation; and if we go to the root of things, we soon acquire the profound conviction that every form in Nature is the expression of the force which has created and developed it.

We implicitly proclaim this truth in all our judgments. It is by his lines and his contour that we foretell the character and pace of a horse; all his manners, his look, his attitude, as I say, a simple indication such as the pricking of his ears, or his way of champing the bit, tell us far more of the secret blemishes of the animal, and of the service he can render us, than all the assurances of the seller.

The peasant by a simple glance, judges, without deceiving himself, of the milk-giving qualities of a cow. Every moment we surprise ourselves by saying, "Here is a fruit which is hard and tough! A beast timid or spiteful!" Why, then, should it not be the same with man? Why, on seeing such a shape of nose, or such eyes, should not one say with as much reason, "Here is a humbug, or a chatterbox, a bad man or a hypocrite; this man is honest and good; that one vicious and crafty!"

Evidently this is the sort of judgments we form every day, only they operate as if we obeyed a sort of intuitive impulse; there is on our part neither pre-conceived reason nor pre-meditation; we submit to a certain kind of secret influence of invisible currents, of which we are not the masters. Why not regulate these intuitions? Why not seek the key of these sympathies and antipathies? Why submit blindly to persuasions and repulsions, against which it would be so easy to arm ourselves, and so avoid being victimised?

At every instant in the course of life we make terrible blunders in this respect.

We must take, I suppose, a domestic circle. Behold a stranger whom we are going to introduce and establish in our home; we are going to give into his hands the keys of the house; he will soon be fully initiated into the intimate secrets of our existence; have we not a powerful interest in divining beforehand the traits, the position, the utterances of this man, whether he does not misinterpret his thoughts, and that we have not received an enemy who will perhaps imperil our lives and property?

By what do we see that he is active, sober, and discreet, that he is honest and merits all our confidence? Will the certificates, which he presents to us, enlighten us in this respect? One knows what value he ought to place on these references of convenience!

But in these circumstances, if we have the good fortune to be something of a physiognomist, what an advantage, and what disillusion!

I knew an old lady who had absolute confidence in my judgment; she never engaged her servants without appealing to my knowledge, and she arranged matters in such a way as to make me meet, as if by chance, with the person whom she wished to take into her service. One day she did not take into account my estimate on the subject of a cook, who had been particularly recommended by friends. She had greatly to repent of it, for not only did this amiable girl make an outrageous number of perquisites from the larder (as I had foreseen), but she drank like a fish. The deception of my old friend was so great that I had the generosity not to take too much advantage of my sagacity.

To change a servant when one is deceived is, without doubt, a most annoying thing, but still more serious are the consequences of an error when one has to take a wife, or acquire a daughter or son-in-law; it is then one cannot give too great proof of his sagacity. A marriage contract is not broken as easily as a salaried engagement, the serious misfortune that one experiences in that case being even more cruel than the other.

One of my friends came one day, as cheerfully as possible, to acquaint me of his approaching marriage. He was entering into a family with whom I kept up relations, and he announced to me his fixed intention to live, once married, under the roof of his wife's parents.

"Take care," I said to him; "it is generally necessary to mistrust mothers-in-law—distrust your future mother-in-law in particular!"

"Nonsense, man. Why?"

"Because she has an inquisitive and authoritative nose, which tells me nothing good."

My diagnosis (I had no need to press it home) was very ill-received by my friend, who, full of happiness, and besides slightly sceptical on the matter, was but little disposed to listen to me. Some months after I saw him again; he was profoundly depressed. The mischief-maker ruled in his house, and the tender solitude of his mother-in-law had (as I foresaw) become the most abominable of plagues. Under the pretext of supervising the repair of his linen, the order of his papers, or the state of his health, an inquisitive hand turned out his drawers and dived into his pockets. If he went out, they were disturbed by his absence; when he returned, they wished to know where he had been; and then, when he forgot to embrace his mother-in-law, he was accused of coldness!

"This woman is killing me with her affection and her little attentions," said my poor friend to me, holding his head in both his hands; "and, to crown it all, when I revolt against this insufferable rule of inquisition, they treat me as an ingrate."

Let us not exercise our choice blindly, you understand. Let us study with care the physiognomy of those who would take a place in our lives, and who take a part, more or less important, in our interests. Our health, our happiness, and sometimes our safety and honour depend upon it!

"Know thy fellows, and know thyself." Such are the two precepts which should be inscribed in the heads of all who work at the foundation of education. "When, then, will the time come when the knowledge of man shall be an integral part—still better, the principal part, the centre—even, of natural history?" said Lavater. We shall not know too much to associate ourselves with the prayer

"The FAMILY DOCTOR conveys to its readers much Useful Information."—*The Graphic*.

uttered by the celebrated physiognomist. True progress will be realised when physiognomy, psychology, and physiology go forward on terms of equality. If one, even in this day, does not accord to physiognomy the position it should occupy, it is because one is not yet sufficiently alive to this truth, that man, intellectual and moral, outside the domain of his will, presents to us, without knowing it, a revealing silhouette in his outward appearance.

The image of an object reflected in a mirror appears only as the object exists; the form is the mirror of the being!

The nose will be our next subject of study.

## THE INCAPABLE WOMAN.

NOWHERE outside of an old-fashioned romance is there a spot in the world where the incapable woman can to-day maintain a foothold. In the leisurely three-volume novel, dear to our grandparents, Arabella and Ariminta, gentle, pallid, timid, submissive creatures, faltered and gasped and fainted gracefully in their chairs at the slightest excuse for such behaviour. To swoon with ease was regarded as a proof of elegance and as a distinctive line marking the difference between the milkmaid and the lady born and bred. Possibly the tight-lacing then in vogue aided the lady in her ability to perform this part of her rôle to the satisfaction of the spectators, who were usually within the receding vision of the fainting and fragile being, whose delicate nerves were proof against neither terrors by nor shocks by day.

Frankly, we doubt whether the old novelists were quite fair in their portraiture of the current life of their times. We find Jennie Deans able to undertake a long, difficult, and every way arduous journey, reaching its end as fresh and hearty and full of purpose and courage as at the beginning, her beauty not marred by hardship and loss of rest. Mary, Queen of Scots, was able to sit for hours in the saddle, no cavalier of her period riding harder or faster or more bravely than the bold and beautiful queen. The famous women who made the Court of France splendid during successive changes and revolutions were not frail die-away creatures of ghostlike hues and willowy outlines; they were substantial flesh-and-blood women, equal to all the dangers and perilous adventures which are often their portion.

Recalling the much harder conditions of housekeeping of the times of our grandmothers and of their mothers before them, we are impressed with the fact that the women who surmounted successfully so many obstacles must have been made of really tough fibre. The modern appliances which give us everything for our tables in highly condensed and beautiful forms, ready for use, with the minimum of preparation, were then unknown. They pounded the pepper and pulverised the sugar and rolled the salt. So far from having electric lights to command at the touch of a mysterious knob, they had not even lucifer matches. The fire had to be kept in by strenuous care, and sometimes one went to her neighbours to borrow a handful of fire with which to light her own. Nothing was easy. Everything required hard, persevering, and unremitting labour, so that we may well believe that the women of that elder day were far from being incapable.

Incapable women may, for the brief season of youth, while the sea-shell colour tints the rounded cheek and the *beaute de diable* beams in the bright eyes, win a passing tribute from thoughtless men. But the women who wear well must know how to meet emergencies, how to order and see their orders obeyed, how to hold themselves in calm composure, whatever tempests are abroad. The incapable woman was never so much an anachronism as to-day.

HOWEVER unwillingly a person who has a strong opinion may admit the possibility that his opinion may be false, he ought to be moved by the consideration that, however true it may be, if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth.—John Stuart Mill.

## FETTERS?—A RETROSPECT.

"How strongly our hearts are fettered on earth."

"FETTERS!" asked a laughing youth, seizing the left hand of his favourite cousin, a bride of three months at twenty. "Fetters?" the plain gold betrothal circle, with its mystic initials, "G. A. T. to E. R., Feb., 1886," then the wedding-ring, heavily chased in semblance of a wealth of golden roses, bearing the new name and date a year later. Life seemed all golden glint, all roses of youth and hope and love; heretofore the best of all things had been rendered as but due her, from parents, friends, and lovers, and in purest faith she had given her life to the keeping of another, submitting with joy and a light heart to wear his gifts—almost resenting the bachelor suggestion—fetters, indeed!

Of her own choice she was bound to the life of another, one whose life had never touched either mental or moral plane such as she held in ideal; won by long persistent devotion, the enlisting of sympathies and influences for his happiness. How unselfish womankind grow to love those in whom a disinterested person would seek in vain for loveliness is a mystery yet to be solved, yet the facts remain and she fondly hoped to find in the cosy new home, in making a true home, the joyous freedom of her previous life, and the realisation of her fair ideal. How soon the unacknowledged sinking at heart at the first disappointment, the first sensation of truth of her enthrallment! While the golden bands fitted snugly the taper fingers, no jingle called to mind the facetious cousin's suggestion, but as the years by trios, as then the months, had passed, and the fingers grew thin so that as often the golden circles slipped off they brought a season of reflection and retrospect, a realisation of what those fetters have been, of the added links to those first perishable ones, these imperishable as are only the immortal souls of little children. Seven trios of years. Sitting alone at the task of the family, mending,—prosaic enough, indeed,—the thin hand holding the "patch beside patch," off slip the now half-worn-away rings, and as she recovers them, memory reproduces the day, "long weary years ago," when they were in the jest and ballinage of her honeymoon first regarded as "Fetters." Stitching away fancy and fact labour together.—The first trio of years found her indeed fettered to a new life, tied down to the prosaic life of the farm routine—the mother's duty. Bereft of her loving mother, and all too late realising her lack of even physical strength to contend with necessary labour, yet wearily struggling to hide away the galling fetters, and be brave and loyal to her master.

Another and another trio still added weight of cares of duties, of little loving souls to be trained for time and for eternity; fettered to humble life by "lack of ducats," too, and faulted by those from whom she most needed kindness.

Another trio of years, the fetters begin to wear into the very soul life and sap her strength from its foundations; rebellious often, alas! how vainly one must struggle who fails to keep her faith. Now as the fifth trio of years close, one, two, three little lives go out over the river to the better home, three broken links on earth, there strongly binding ones to renew a hope of *réunion* where sorrow never comes.

Fetters? How strongly our hearts are fettered to earth by our ties of blood! Each child a link in the great cable, and the part on the other side has its helpful influence over first and last. Sixth trio, and the baby girl, whom, as seventh daughter, she almost ventured to call "Omega," yet left unspoken the thought. Now they begin to go out into the great world, and the magnetic influence of the mother love and care must reach out after them, must in turn be fetters to hold them to truth and right. Years of the seventh trio are gone and yet in the great need for the day, she has realised the promised "strength," and in retrospect sees the bright spots, the triumphs, and fettered to earth by mother love and desire feels, too, that release from all that these imply comes only in the fulfilment of the too often lightly spoken, lightly heard, "Till death do us part."

## THE FIRST QUARREL.

WHY THE TINIEST FRACTURE OF FAMILY PEACE SHOULD BE AVOIDED

WATCH beginnings. There is always a point where the entering wedge breaks in, and after this the progress of disintegration is easy. It is the first quarrel that makes possible the next, and after one or two fights and reconciliations, those who love each other, it may be devotedly, grow accustomed to strife, and no longer feel horror-stricken at the bare mention of it. The little rift is not more than a hand-breadth, but may widen and broaden until alienation and distress and the wreck of all household happiness follow the first tiny fracture of peace.

In the union of husband and wife, which is the most intimate and confidential relationship on earth, there must be something more than mere superficial admiration, the one for the other. The two have pledged to each other a lifelong consecration. Nothing can affect one without equally affecting the other. For weal or woe they have joined hands, and to the outside world they present a united front.

And yet, if testimony could be taken, it would be found that many married people have not been perfectly happy during the early years of wedlock. There has been friction. There has been disappointment. The little rift has been suffered to open the way for estrangement.

"We decided," said a man, whose long life has been singularly tranquil and satisfactory: "we decided, my wife and I, when we were married, that we would never let the sun go down on any lack of peace between us. We would ask each other's pardon, if necessary, but we would never quarrel. One or the other should always give up the point on which both could not agree, and, whatever else came to us, we resolved to have no discord." Beware of the little rift.

## HOW TO TREAT NEURALGIA.

IN the first place we must understand distinctly what neuralgia is. Neuralgia is the result of the irritation of a certain nerve, which may be brought on either by chill or weakness. We know that the nerve is the seat of the disorder, for we can distinctly trace the pain along that particular nerve. The neuralgia of the face, which is the form very prevalent among women, is also known as *tic-doloureux*. It comes on in paroxysms, lasting about a minute, suddenly coming, and as suddenly disappearing. This form of neuralgia may be due to nervous strain, exposure to cold, lactation, or some mental excitement. Sciatica is also another form of the same complaint. It is usually associated with gout, rheumatism, and allied complaints. The pain becomes intense upon the slightest movement of the body. We can distinguish neuralgic pains from others by the fact that they are not associated with inflammation, fever, or any structural change in the parts affected. Where they result from exposure to cold, external applications, such as menthol, or some stimulating liniment will frequently dispel the pains altogether; where due to nerve weakness, internal tonic medicines must be resorted to. The Quinine and Gelsemin Palatinoids are about the finest remedies to alleviate and give temporary freedom from pain I am acquainted with. They can be obtained from any chemist, and I usually give one every two hours until the neuralgia ceases. But bear in mind that these afford temporary relief only. If we wish to guard against future attacks, we must fortify the system by strengthening the nerves, and giving tone to the system. For systematic tonic treatment there is nothing to equal a tablespoonful of Oppenheimer's Cream of Malt with Cod-liver Oil and Hypophosphites taken regularly three times daily after meals. Do not forget to take a good daily walk, obtain a plentiful supply of fresh air, play tennis, cycle, cricket, golf, anything you will so long as you get healthy exercise. Massage and the Turkish bath have many advocates, while alternately hot and cold water douches along the course of the nerve have proved beneficial.

## ADVANCE OF KNOWLEDGE.

THE growth of higher knowledge has been a very gradual one, says the *Nineteenth Century*. It has come by leaps and bounds within the last two centuries, after remaining stationary for more than sixteen hundred years. The nineteenth century especially has been a period of activity and progress in the various branches of science, such as the world has never seen before. Nor could it have been seen before. The full light of liberty—liberty of action and liberty of thought—was necessary for any great forward movement, and the world was lying in the bonds of darkness and superstition. The tree of liberty is a plant of slow growth, that has fought its upward way painfully, bowing its head often beneath the blasts of persecution, and often broken beneath the foot of the oppressor. Like Igdrazil, the tree of life, it has its roots deep below in the kingdom of the dead. It was not till this century that it had attained such growth as to burst into the blossom which is everywhere bringing forth noble fruit for the service of man.

Had Hahnemann and Stephenson, Herschel and Edison lived in the middle ages their genius would have availed mankind nothing. The slow world was not ready for them, and it would have crushed and silenced them as it did Galileo and many another brave spirit that was born out of time. They would have gone under, and shouts and hymns would have celebrated another triumph of orthodoxy and authority. Authority was the juggernaut beneath whose car all the best and boldest spirits were crushed in the sacred name of religion.

"In almost all places of studie," wrote Cornelius Agrippa, "a damnable custom is grown, in that they binde with an othe the schollers which they receive never to speak against Aristotle, Boetius, Albert, or any other of their schollers being accepted a God, from whom if a man differ a finger's breadth in thought, immediately they will call him Heretike and worthy to be burned."

Montaigne, too, adds his protest to the same effect:

"The opinions of men," he says, "are received according to ancient belief, by authority and upon trust, as if it were religion and law, and thus the world cometh to be filled with lies and fopperies. It is not inquired whether Galen has said anything to the purpose, but whether he has said so-and-so; and 'tis irreligion to question any of Aristotle's decrees."

The old Frenchman adds quaintly:

"Whoever should bundle up a lusty faggot of the fooleries of human wisdom would produce wonders."

## SPECIALITIES.

## SWINBORNE'S ISINGLASS AND CALVES' FEET GELATINE.

WE have carefully examined the two preparations forwarded to us, and find them of perfect manufacture. The economical purposes served by gelatine on the human body are well known, and the manufacturers have accompanied the preparations with a useful little book of recipes for jellies, creams, and other invalid cookery written by Lady Constance Howard. The specimens sent us were perfectly pure, tasteless, and absolutely free from smell, subserving admirably the purposes requisite for the *chef de cuisine*.

## DOUGHTY'S VOICE LOZENGES.

THESE are oval tabloids of attractive appearance, and pleasant taste, being in addition nicely perfumed. We have tested

## FAILING EYESIGHT.

Thirty years' practical experience has proved Mr. Bluett's system of sight testing by examination of each eye separately to be the only perfect method of accurately determining the lenses required to restore the vision, and make reading or working a pleasure.

Consultations Free. Spectacles at Store prices.  
**F. J. BLUETT,**  
Specialist in Spectacles, and author of "Detective Vision, its Cause and Cure."

8A, GT. PORTLAND STREET, LONDON, W.  
(FOUR DOORS FROM OXFORD STREET.)

DUNN'S  
FRUIT SALINE

This PURE preparation is a quick relief for Sick Headaches and Derangements of the Stomach and Liver, Purifies the blood and is delightfully refreshing. Through Chemists and Stores.  
SPECIAL OFFER.—To prove its efficacy, 1s. 6d. bottle will be sent post free for 1s. 6d. stamps. Works: CROYDON, LONDON

their effects upon our musical friends and find them unanimous in expressing the opinion that Doughty's Voice Lozenges are of the greatest possible service in restoring and sustaining the jaded vocal organs when broken down with overwork, or debilitated from catarrh.

## NEWBERRY'S "BRAIN" SALT.

WE have examined and tested samples of this preparation; we find it pleasant to take, harmless in composition, but calculated to act well in cases of headache and brain fag, due to overwork and anxiety.

## OUR OPEN COLUMN.

## CORRESPONDENTS' OPINIONS.

## MILITARY TIGHT-LACING.

TO THE EDITOR OF THE FAMILY DOCTOR.  
SIR,—The letter about military tight-lacing in Russia is most interesting, and many thanks are due to your correspondent. It would be most interesting, I think, if some of your readers could give some information upon this subject in foreign military colleges at the present day. German and Austrian officers undoubtedly wear corsets, but whether the custom is begun at school I cannot say. A friend of mine saw the cadets of the American Military Academy, and remarked on the whiteness of many of their faces. He was told this appearance of ill-health was largely due to the extreme tightness with which they drew in their broad leather belts, many young men being in the habit of confining their waists in belts, furnished with four or five buckles, drawn in regardless of the pain, indigestion, and headaches. Hoping to read more of this interesting topic, I remain, yours truly,

A WILLING WASP WAIST.

## Notes &amp; Queries

This column is specially devoted to subscribers who are desirous of obtaining information on any practical subject, whether Domestic, Medical, Sanitary, or otherwise. The Editor suggests that Correspondents should express their wishes in as brief a manner as possible.

All letters should have the words "NOTES AND QUERIES" on the envelope.

## QUESTIONS.

**BANKRUPTCY.**—What is the position of the employé of a bankrupt firm? Is he entitled to salary in lieu of notice, or does his pay cease at the date of the stoppage?—"Employee."

**CUSTOMS.**—What book details the manner in which customs duties are charged and paid in different European countries?—"Fuller."

**EARRINGS AND SAILORS.**—What is the reason that we always see nautical men with small gold rings in their ears in all nationalities?—"D. Lewinn."

## ANSWERS.

**EXECUTION.**—It is absurd to suppose that your rights, as the judgment and execution creditor of a firm, can in any way be prejudiced by your subsequent sale to the same firm or their assignees in trust for the benefit of creditors.

130th Thousand Post free of Author, 2s. 6d.

THE CURE OF  
CONSUMPTION

CHRONIC BRONCHITIS, ASTHMA, & CATARRH.  
By E. W. ALABONE, M.D. Phil. U.S.A., F.R.M.S., Late M.R.C.S. Eng., late Consulting Surgeon to the Lower Clapton Orphan Asylum, &c., Lynton House, Highbury Quadrant, London, N.

By the success of this discovery all barriers have been broken down, and it is now an acknowledged fact that CONSUMPTION, BRONCHITIS, and ASTHMA ARE CURABLE by this treatment. MANY THOUSANDS of cases, abandoned as hopeless, have been SUCCESSFULLY treated.

Dr. FAIRBAIN, M.D., L.R.C.S., writes: "The success of your treatment of Consumption is simply marvellous. I had no less than 60 cases of cure last year."

**NERVOUS and WEAK MEN.**—Vigorous Vitality Ensured to men suffering from nervous exhaustion, low vitality, &c. Try HALE'S (the only genuine that does not blister or injure the skin) PATENT ELECTRIC BELT and Suspensor. Comfortable, curative. Effective in electric qualities. No metallic contact with the body. This scientific appliance will infuse a mild continuous current through the diseased nerve centres. Descriptive circular, undoubted testimony, sent free. ARTHUR HALE and SON, Medical Galvanists, 30, Regent Street (Piccadilly Circus.)

**LOSS.**—The occupier of the house in which a person has lodgings is not liable to him for any loss of his goods which he may sustain. It is the person's duty to lock them up safely.

**DOG.**—Little dogs that won't take their medicine should be made to take it. Now if I were your master I should open your little jaws, and give you a grain and a half of pure salutarina, and half a drachm of grated aconite nut, made into a stiff pill with lard, and follow it, in about an hour, with a good teaspoonful of castor oil. Your worm troubles would soon disappear and the others probably follow them.—"Fugh, Liverpool."

ANSWERS  
-TO-  
CORRESPONDENTS.

Correspondents will in every case be answered as early as space and time will permit.

It is particularly requested that all communications may be distinctly written and concisely expressed, and marked "ADVICE GRATIS" over the address on the envelope.

All communications should be addressed to the EDITOR of the FAMILY DOCTOR, 18, Catherine-street Strand London, W.C.

Just published, 1s., post free 1s. 1d.

**THE PHYSICIAN.** A Family Medical Guide. Containing upwards of 250 Recipes for the prevention, treatment and cure of nearly all the ills incidental to the human frame, with advice to the healthy, rules for the sick, tables on digestion, &c. Also a Treatise on Consumption. By Eminent Physicians. Carefully copied from the prescription book of a London Chemist. Thirty years' experience.

Offices—18, Catherine Street, Strand, London, W.O.

## ADVICE GRATIS.

BY A PHYSICIAN AND SURGEON.

N.B.—Communications requiring answers in this column must be marked outside as directed above or they will not be noticed.

Any of our Subscribers or Readers who desire to have their answers inserted in the earliest number should enclose with their questions a *Postal Order* for ONE SHILLING or more. SUBSCRIBERS ARE REQUESTED TO CROSS THEIR ORDERS. These letters must be received not later than *Thursday*, otherwise the number of letters we receive renders it quite impossible to pay proper attention to them as the paper goes to press on *Friday*. The answers to these will therefore appear in the issue of *Saturday week* following. The sums we receive in this way will be sent to one of the leading Hospitals or other charitable institutions.

## The "Family Doctor" Hospital Fund

Has already given large amounts to the following Hospitals, &c.:

King's College Hospital.	Nazareth House, Ham-
University College Hos-	metersmith.
pital.	British Home for Incura-
London Temperance Hos-	bles, Clapham-rise.
pital.	Ophthalmic Hospital, King
West London Hospital.	William-street, W.C.
City of London Hospital	Poor Box—Five Police
for Diseases of the Chest	Courts.
Evelina Hospital for Sick	St. Thomas's Hospital.
Children.	City Orthopaedic Hospital
Hospital for Sick Children	London Hospital.
St. Peter's Hospital.	Charing Cross Hospital.

**ROBERTS.**—1. When thirsty take lemon juice neat, without sugar. 2. Eat your food very slowly, drinking only after meals. Wash your face with hot water, using Terebene or Vinolia soap. Rub the parts thoroughly with a towel after drying. Pierce each spot with a spear-headed needle at bedtime, and take the following mixture before each meal: Dilute muriatic acid ten minims, sulphate of magnesia half a drachm, tincture of nux vomica eight minims, water to half an ounce.

## EASTON'S SYRUP.

WHENEVER this Syrup is prescribed the best and purest Preparation should be taken. Made by J. SELLERS, Manufacturing Chemist, 57, Farringdon Road, London, E.C., who will forward either sized Bottle free by post for three extra stamps. Or any Chemist will procure it. Sold in 4-oz. bottles, 1s. 6d.; 8-oz. bottles, 2s. 6d. 16-oz. bottles, 4s. 6d.

"THESE NATURE'S HERBS," positively nothing more universally reliable known, as proved by Published Testimonials of most Influential Authorities; they readily relieve aches, pains, inflammations in every part, headache to sciatica. Why experiment when a remedy with a three-quarter-century record such as this costs but a farthing a meal? send 16d. or 36d. to-day—Sir Thomas's Buildings, Liverpool, or Chemists—for BROMLEY'S GOUT & RHEUMATIC PILLS THE FAITHFUL CURE.

# DISINFECTION.

## KINGZETT'S

(PATENT)

### SULPHUR FUMIGATING CANDLES ARE PERFECT

And afford the best means of Preventing and Arresting the Spread of Cholera, Fevers, and all Infections by Fumigation with Sulphur.

They can be lighted with the greatest ease, and burn steadily and thoroughly.

6d. Size.

1s. Size.

Full Particulars will be Sent on Application.

**THE SANITAS Co., LTD.,**  
**BETHNAL GREEN, LONDON.**  
*(Sole Manufacturers also of the famous "Sanitas" Disinfectants.)*

**GEORGIUS.**—Your condition is by no means a solitary one. They are as common as they are relievable. But it is useless for you to suppose that you will be able to escape a personal interview with a medical man, for that is out of the question. You may take cold baths, plenty of exercise, good food, and pay due attention to the state of the bowels; but you will require some additional local treatment, for which you will have to consult a specialist.

**JULIA.**—You appear to have psoriasis, but do not give us anything like sufficient detail to enable us to judge as to its cause. You may, however, try the following mixture after each meal: Fowler's solution five minims, water to one teaspoonful, and use for each spot after bathing off the scales, chrysophane ointment (five per cent). To be applied on alternate nights. If after a month of this treatment there is no improvement, write us again restating your request that we should give you the name of a specialist.

**T. K. H.**—We certainly do not think you need "go under" at forty-three. On the contrary, there is reason to believe that a course of electrolytic treatment might be of the greatest possible service in your case. You must, however, consult a properly qualified man, and if you wish us to guide you further it would be better to send us a directed envelope, as we are unable to publish the name of any physician in these columns.

**CHARLES GRAHAM (Camden Town).**—Take a cold bath every morning and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime, and followed the next morning by a mild dose of aperient fruit salts. Let your meals be composed of light and nutritious diet, and taken regularly at uniform hours. Take a teaspoonful of Farrish's Food three times a day immediately after meals.

# FOR COUGHS

# POWELL'S BALSAM OF ANISEED

For **ASTHMA, BRONCHITIS, NIGHT COUGH, INFLUENZA, and ALL LUNG TROUBLES.**

**SAFE AND RELIABLE.**

Established 70 Years.

See Trade Mark on Wrappers. Beware of Imitations.  
**SOLD BY CHEMISTS EVERYWHERE.**

**J. J. F.**—You had better go on with the treatment we have already recommended. It seems to have been very beneficial in your case, and we accept your grateful thanks with pleasure and pride. A glass of beer in the day time will not hurt you, but do not exceed this amount. Be careful to keep the bowels freely open.

**PETRUS NIGER.**—The desire is easily checked by means of drugs, such as bromide of potassium and salix nigra, but this is likely to be unbeneficial in the long run. We do not see what difficulty there is in obtaining a companion under the relations you suggest. No diet will be particularly good for you. The only thing you can do is to refrain from stimulating food and drinks. You may try the following: Bromide of potassium one drachm, syrup of oranges two drachms, chloroform water to six ounces. One sixth part three times a day.

**W. H. G.**—You must avoid all beer, wine, and spirits, and much walking or standing about. Take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buchu to six ounces. One sixth part three times a day immediately after meals. If this does you no good, the chances are that you have a congested patch which requires electrolytic treatment. We know of no one in Bristol who is qualified to undertake such cases.

**EDWARD.**—You must use plenty of soap and warm water to these, and they will dry up in time. No special treatment is required beyond being careful to dry thoroughly after washing, and then dusting with a little oxide of zinc powder.

**J. B. P.**—We cannot suggest even a treatment for a skin disease of which we have no description. The only thing you can do for this is to go and see a skin specialist.

**BURNEX.**—You had much better follow the doctor's advice. He will not wish you to have the abscesses opened unless he thinks it necessary. Continue to take the pills if you find you get constipated without them, that is obvious. If you prefer to be constipated that is merely a matter of choice. We do not see that any advice is necessary under the circumstances, especially as you appear to be visited by your own doctor.

**C. B. 35.**—You are perfectly right, medicine and cold baths alone are of very little use indeed. You had better send a stamped addressed envelope for advice.

**DR. DUNBAR'S ALKARAM;**  
 or Anti-Catarrh Smelling Bottle,  
 Is the only cure yet discovered for Colds by inhaling.

## ALKARAM.

If inhaled on the first symptoms of Catarrh, Will at once arrest them, and in the severest cases will generally cure in a single day.

## ALKARAM

Contains no narcotic, the smell is agreeable and reviving, and relieves head aches; in fact, it should be on every toilet table.

## ALKARAM

Is sold by all Chemists at 2s. a bottle. Address **DR. DUNBAR**, care of F. Newbery and Sons, 1, King Edward Street, London, E.C.

## DOUGHTY'S VOICE LOZENGES

KEEP THE VOICE IN TONE.

From Signor **TOMMASO SALVINI**, the Eminent Tragedian.

"Theatre Royal, Drury Lane, May 23, 1875.  
 "SIR,—The other night, when my voice would have otherwise failed, I was able to accomplish my duty to the very last in "Othello," which I owe entirely to your Voice Lozenges."

## ASK YOUR CHEMIST FOR THEM.

Sold in boxes by all chemists. 1s., 2s., 6d., 5s., and 11s., or will be sent direct, post free, for 1s. 2d., 2s. 9d., 5s. 4d., and 11s. 6d. Sample boxes 6d., post free 7d.

**FRANCIS NEWBERY AND SONS,**  
 1 and 3, King Edward Street, Newgate Street, London.  
 Established A.D. 1746.

## NERVE AND "BRAIN" SALT.

FOR HEADACHE AND SEA SICKNESS.

**F. NEWBERY and SONS**, 1 and 3, King Edward Street, Newgate Street, London, E.C. (established A.D. 1746), send "BRAIN SALT," postage paid, for 3s., to any part of the United Kingdom; and those who fail to procure it of chemists may thus readily obtain it from the Sole Proprietor.

**JAMES F.**—You had better take a cold bath every morning and keep the bowels freely open by means of a teaspoonful of compound liquorice powder taken every night at bedtime and followed the next morning by a mild dose of aperient fruit salts. Your meals should be light and nutritious, and taken regularly. Take a teaspoonful of Farrish's Food three times a day immediately after meals.

**G. W. G.**—You ought to go to a medical man and have your varicocoele attended to. It is of no practical or permanent use to wear suspensory bandages, &c. The veins must be tied. With regard to the skin disease, we are not in a position to say what it is without a personal examination. You should take frequent warm baths, and be careful to keep the bowels freely open. Avoid much standing or walking about. Take a teaspoonful of Farrish's Food three times a day immediately after meals.

**C. F.**—If your family history is good on both sides, there is no harm in your marrying. With regard to the other matter, you must come to some arrangement between yourselves. **CARRIAGE PAID.**—We have inadvertently answered your letter in the ordinary columns.

**JAMES PATTERSON.**—You had better use the following:—dissolve this powder: Borax, chloride of sodium, and bicarbonate of soda, of each, seven grains, powdered white sugar fifteen grains in a half-teaspoonful of warm water, and sniff up from the palm of the hand several times a day, bringing it out of the mouth, so as to allow it to traverse the length of the nostril. Keep up your general health also, paying due attention to the state of the bowels, eating regularly well-cooked and assimilable meat, such as fish or poultry, getting a fair amount of active outdoor exercise, and taking as a general tonic a teaspoonful of Easton's Syrup three times a day immediately after meals. Persevere in this treatment, for you must not expect to be cured at once.

**FRAN.**—There is nothing abnormal or uncommon about this. Nothing requiring a particular treatment so long as you look after your general health.

**F. W. BELLAMY.**—The only thing you can do in a case like this is to call in a doctor to advise on the case. Should you neglect to do so and anything serious happens you will be to blame.

FOR INFANTS AND INVALIDS.

# SWINBORNE'S ISINGLASS

Is the Best.

A little should be taken in Tea, Milk, or Broth, or as a Lemon Jelly.  
 IT IS MOST NUTRITIOUS.

"The FAMILY DOCTOR is stored with useful Hints for the Preservation of Health."—*Daily Chronicle.*

**GRATEFUL.**—You should take a cold bath every morning and get a fair amount of active outdoor exercise. Avoid all beer, wine, and spirits, and take the following medicine: Sulphate of magnesia three drachms, carbonate of magnesia half an ounce, spirit of chloroform one drachm, peppermint water to six ounces. One-sixth part three times a day between meals. If the old trouble is still on you, you ought to have that cured or you will never be well.

**RAW RECRUIT.**—You must avoid all beer, wines, and spirits, and much standing or walking about. Be careful to keep the bowels freely open, and take the following medicine: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre two drachms, tincture of hyoscyamus two drachms, infusion of buckthorn six ounces. One-sixth part three times a day immediately after meals.

**CORPORAL BUGLE.**—Sudden distension of synorial pockets in connection with the joints is not at all unusual, but we do not think change of dietary would be likely to prevent such troubles. You should, however, give up beer altogether, and we do not advise you to replace it by any other stimulant. If you must drink spirits, the least harmful to you would be an occasional very small dose of old Scotch whiskey (Robertson's by preference) well diluted with soda or seltzer water. Keep the bowels free, and do not take too much meat.

**ANEMIA.**—Your mother has expressed a very foolish opinion—entirely wrong, by the way—in saying that you cannot be cured. The opinion is not only foolish, but wicked, for the disease, under proper conditions, is one of the most amenable to treatment. You can obtain the Biphosphates of Messrs. Oppenheimer and Co., 14, Worship Street, London, E.C., who will send you a price list on application. At the same time, you should take each morning a teaspoonful of Epsom salts dissolved in water. You have no need to despair; write us again in a month, with a report of progress, and we will advise you again.

**DAISY.**—It would have been much better had you given us some account of your age, occupation, habits, diet, &c., as well as of any other illnesses which you may have suffered. You do not say whether you have bad teeth; whether you have neuralgia, or other nervous trouble of any kind. If you will give us this information we shall be glad to do all we can to help you. Meanwhile you may apply the following lotion each night to the scalp using a small piece of sponge for the purpose: Blistering fluid three drachms, glycerine six drachms, rose-water to six ounces.

**R. F. W.**—We cannot tell from your writing whether you are male or female, nor are we able to guess at your age, occupation, or habits. Few symptoms are given, and these are quite insufficient to enable us to make a diagnosis of your case. You may have gastric catarrh, with some engorgement of small vessels in the pharynx. On that supposition we suggest your taking the following mixture before every meal: Subnitrate of bismuth fifteen grains, mucilage of acacia half a drachm, tincture of gentian half a drachm, camphor water to half an ounce. Take also one teaspoonful of compound liquorice powder in a little water each night at bedtime.

**R. F.**—We should advise you to read the advice given to "Roberts," and to follow the instructions there suggested. You would do wisely to give up the milk and strabout, to take underdone meat and fresh fish each day, and to eat plenty of green vegetable.

**A. Y. Z.**—Strictly follow up the regimen prescribed for you and take the following medicine: Subnitrate of bismuth one drachm, mucilage of acacia three drachms, aromatic spirit of ammonia one drachm, chloroform water to six ounces. One-sixth part three times a day immediately after meals.

**NEMO.**—We presume you wish us to use this pseudonym again. You had better take ten to fifteen grains of antipyurin three or four times a day while this neuralgia and the other pains last. If you do this you will soon find that this trouble disappears. Keep up your general health, take plenty of active outdoor exercise, and keep the bowels freely open.

**DOOW BONG.**—1. Have this removed; you had better see a doctor with that object. 2. This is a question for an oculist; we cannot tell you what the weakness of the eye is due to. 3. No; we know of no reason.

**ENTREATY.**—There is no such thing as a "sure cure" for any complaint known to the physician. Such things are only talked of by the charlatan and by the advertiser of quack medicines. Take three grains of iodide of potassium in half an ounce of camphor water three times a day, and if you are a smoker, give up the habit.

**F. A. G.**—1. Dunn's Fruit Saline (W. G. Dunn & Co., Croydon) you will find as good as any others. If you will say exactly what the conditions are, for constipation may depend upon many causes, we shall be happy to give you all the information in our power as to the length of time it may need to be administered. 2. Use a cathart or an indiarubber brush, or a glove of rough Turkey towelling. The ordinary brush is not what we should designate as a "flesh brush."

3. Leave well alone since the swelling causes no inconvenience. **M. F.**—Persevere with the medicine, use the application already advised for the warts, and see that the outer skin is completely retracted and the whole of the inner parts washed with soap and warm water at least once a day. The pain, if given are suggestive of early stricture, but only examination with an instrument can determine the fact positively. We still think you would do wisely to consult a surgeon.

**R. C. H. D.**—1. It is possible you have a varicose; if so you ought to have it operated on, as nothing else will cure it. 2. For this also it will be necessary to have something done. Send a stamped addressed envelope and we will recommend some one.

**C. R.**—You had better take a teaspoonful of confection of senna every morning before breakfast, or if you like, take a dose of this at night with some fruit salts in the morning. You should not allow yourself to get into this condition; it is only caused by want of attention to diet and exercise.

**G. STREYER.**—We have no means in your letter upon which to found a diagnosis. There must be some reason for the appearance of the spots and the simultaneous falling out of the hair. If you write us a full description of the case, naming habits, occupation, diet, &c., we shall be happy to prescribe. Meanwhile you had better inquire whether the patient has had any sore throat or any pains in the bones or elsewhere.

**ZERO.**—Your liver is out of order, and you will do well to take one of the following pills daily at dinner time: Blue pill one grain, pill of colocynth and henbane three grains, as well as a teaspoonful or less of sulphate of magnesia in water each morning before rising. Your eyes should be examined by an ophthalmic surgeon with a view to the use of spectacles if necessary.

**X.**—The so-called "remedies" named are useless for any kind of skin disease. If you will describe the particular complaint from which you are suffering as nearly as you can, stating at the same time your sex, age, occupation, habits, and diet, we shall be glad to suggest some treatment for you.

**D. D. A.**—1. The continued improvement in your case is very satisfactory. Keep on with the medicine for another month and report again. The hair will grow presently. 2. Certainly the child should undergo a course of mercurial treatment. The rule is contrary to what you state. Children properly treated, as a rule, do not die, but recover entirely. Give the baby half a grain of grey powder twice a day, watching for any effect upon the gums. This should be continued for a month, then intermit for a week and again persevere with for a further period. Report again when writing of your own case.

**CARRIAGE PAID.**—As pencil writing is difficult to read in gas light, we shall esteem it a favour if you and several other correspondents will in future write in ink. As you say, the advertiser whose paragraph you enclose is a quack of the best sort, whom you are wise to avoid. We do not think the description in the paragraph applies to known pathological condition. You probably have eczema of the leg, though from the imprecise description it is not possible to be positive on the point. You may take each morning a teaspoonful of sulphate of magnesia dissolved in a little water. Bathe the part each night with warm water to bring away crusts; dry carefully, then apply the following ointment: Creosote fifteen minims, red oxide of mercury four grains, oxide of zinc one drachm, vaseline one ounce. Drink no beer, and keep the ointment applied on old linen rags, afterwards bandaging the part.

**M. P.**—1. These habits are, we regret to say, very common in subjects of both sexes. The difficulty is to obtain a candid history of the whole of the circumstances. Take the following mixture after each meal: Bromide of sodium twenty grains, carbonate of ammonia two grains, glycerine twenty minims, tincture of bark half a drachm, water to half an ounce. 2. The medicine ordered above will help to relieve the excitement and to induce sleep. Beer at that late hour is not good for you, and may possibly be accountable for the moodiness named. Try a cup of Bovril instead. If not better in a month write again.

**CISSE.**—The condition is known as dropsy. It is not only difficult but dangerous to treat such cases without careful examination of the patient. Your best course will be to consult some good doctor in your own neighbourhood.

**QUININE.**—The biphosphates of carbonate of iron can be obtained at Messrs. Oppenheimer & Co., 14, Worship-street, E.C. They will send you full particulars of price and method of administration.

**MISERABLE.**—Blushing is not at all infrequent in young fellows of your age. There is, as a rule, some cause for it, but you make no mention of such a thing in your letter. Take a dose of the following mixture three times daily: Liquid extract of ergot fifteen minims, bromide of potassium twenty grains, tincture of nuxvomica five minims, water to half an ounce. Keep the bowels acting freely, take plenty of outdoor exercise, avoid sensational literature, and rest assured that by degrees all your difficulties will disappear.

**FRANK BULLEY.**—1. Ophthalmia neonatorum. 2. Sulphate of copper one grain.

**LUX.**—You had better bathe well with cold water every morning and keep the bowels freely open by means of some Dunn's Fruit Salt taken every morning. Take a fair amount of outdoor exercise, and wear a suspensory bandage so as to keep the parts well supported. You should, however, see a doctor who makes a speciality of this complaint, and can pull you together again. Send a stamped addressed envelope, and we will advise you.

**POSTER.**—You will have to pass an examination of the Pharmaceutical Society if you wish to assume the position of a chemist. It is illegal to vend medicines without a license from this society. The blatant quacks who sell their so-called remedies at market corners do so at their own risk, but even they require a hawker's license, which is obtainable from the police at a very small sum.

**M. PEPPEBORN.**—She had better take the following medicine: Carbonate of ammonia half a drachm, spirit of chloroform one drachm, decoction of bark to six ounces. One-sixth part three times a day. She must not take much exercise, but must wrap up warmly, and keep out of the draughts.

**DEBILITATED.**—Most likely the condition is curable if you persist in taking the medicine regularly, and using the local remedy as you have been doing. You should take the following: Iodide of Potassium one drachm, aromatic spirit of ammonia one drachm, decoction of bark to six ounces. One-sixth part three times a day after meals. The noises in the ears will cease as the catarrh disappears. You ought to see a good skin specialist to cure you of this trouble. It is not always easy to know to what cause it is to be attributed. Should you be coming to town and let us know we can advise you whom to see.

**COTOPANI.**—You do wisely in avoiding those persons who advertise various treatments for these troubles. They are nearly, if not quite, all what you term them in your letter. Medicine alone, however, is not all that is needed in such cases, though as you wish it we append a prescription: Tincture of peruviana four drachms, sweet spirit of nitre one drachm, fifteen grains, spirit of chloroform five minims, quinine (sulphate) one and a half grains; water to half an ounce. To be taken three times a day before meals. You must take care that the bowels are not constipated.

**TOTTENHAM.**—This is a very common thing. You had better take the following: Oil of sandalwood three drachms, mucilage of gum acacia four drachms, sweet spirit of nitre one drachm, tincture of hyoscyamus two drachms, infusion of gentian to six ounces. One-sixth part three times a day immediately after meals. You must avoid all beer, wines, and spirits, and refrain from any excess in standing or walking about. With regard to the other party, frequent injections of lime water must be used.

**D. B.**—We are always advising in cases similar to yours. The only cure for this condition is electrolysis of the stricture, which you had better get done. If you wish to know where to go, send a stamped addressed envelope, and we will recommend you someone.

**A FOND MOTHER.**—If your little girl is suffering from infantile paralysis, you may use the hot salt water and galvanism, regularly applied for some months. Rubbing with ordinary oil is very little use in this case. You had better give her the Scott's Emulsion of cod-liver oil with hyposphites, a teaspoonful twice a day. This is both food and medicine combined.

**CONSTANT READER.**—Your work, being always in a more or less dirty atmosphere, would be quite sufficient to account for the presence of black spots on your nose and cheeks. Rubbing with ordinary oil is very little use in this case. You had better give her the Scott's Emulsion of cod-liver oil with hyposphites, a teaspoonful twice a day. This is both food and medicine combined.

**J. W. C.**—It is impossible to diagnose between the several diseases of the heart without careful auscultation. However, we cannot find that you describe the symptoms of fatty degeneration, not fatty deposition, and think that a modified dietary may help you. Avoid fats, starchy foods, sugar, beer. Eat lean meat, green vegetables, stale bread. Drink claret or lemon juice with water.

**J. LEACH.**—We agree that the cauterisation suggested would do you no harm, but without careful auscultation, and some of the out-of-date practitioners, it might be productive of certain serious results. Your case, however, would be met by electrolytic treatment properly carried out. See reply in this column to "T. K. H."

**E. A. STEPHENS.**—The trouble described has not yet been dignified with a name of its own, and is dependent upon insufficient secretion of acid, and may have arisen from the bad habit of replacing the natural lubricator of solid food by drinking with each morsel. You will have to give up the habit entirely, and learn to eat slowly without drinking at all until the meal is finished. In addition, you are nervous and your letter indicates that there are evidences of some hysteria. Take, therefore, the following mixture three or four times daily between meals: Bromide of potassium fifteen grains, carbonate of ammonia four grains, glycerine twenty minims, tincture of bark half a drachm, water to half an ounce. Keep the bowels acting freely with liquorice powder.

**DOLOR.**—If you are suffering from spinal weakness you should have the spinal column galvanised. Keep the bowels freely open, and take a fair amount of outdoor exercise. With regard to a suitable embrocation you had better use Eiliman's or St. Jacob's Oil, well rubbed in. Also take a teaspoonful of Sellers' Eason's Syrup three times a day immediately after meals.

## Fresh Air and Exercise.

Get all that's possible of both, if in need of strength, flesh and nerve force. There's need, too, of plenty of fat-food.

## Scott's Emulsion

of Cod Liver Oil builds up flesh and strength quicker than any other preparation known to science.

Scott's Emulsion is constantly effecting Cure of Consumption, Bronchitis and kindred diseases where other methods fail.

Prepared by Scott & Bowne, Ltd., London.

Sold by all Chemists and Vendors of Medicine at 2/6 and 4/6.

8A, KIRBY ST., HATTON GARDEN, LONDON, E.C.

## "MALT-COFFEE"

(PATENTED.)

Prepared from delicious Mocha Coffee and nourishing Malt. Taken at breakfast fortifies the system for the day; taken after meals, without milk, prevents and cures INDIGESTION. Does not excite the nerves and cause sleeplessness, like ordinary coffee or tea, or affect the liver like chicory. It is as nourishing as stout or ale. It goes much further than any ordinary coffee, therefore it is cheaper, but by far superior. Highly recommended to invalids recovering and ladies of delicate health. Of Chemists, Grocers, and Stores, or send 12 stamps for a sample tin.

MALT COFFEE CO., MONUMENT BUILDINGS, LONDON, E.C.

"The FAMILY DOCTOR ought to have a very Wide Circulation."—Weekly Dispatch.

"FAMILY DOCTOR" PUBLISHING CO.,  
18, CATHERINE ST., STRAND, W.C.

**"FOR THE BLOOD IS THE LIFE."**

FOR CLEANSING AND CLEARING THE BLOOD from all impurities it cannot be too highly recommended. For Scrofula, Scurvy, Eczema, Skin and Blood Diseases, and sores of all kinds it is a never-failing and permanent Cure. As this Mixture is pleasant to the taste, and warranted free from anything injurious to the most delicate constitution of either sex, the Proprietors solicit sufferers to give it a trial to test its value.

THE BLOOD being the source from which our systems are built up, and from which we derive our mental as well as our physical capabilities, it is important that it should be kept pure. If it contains vile festering poisons all organic functions are weakened thereby, and settling upon important organs, such as the lungs, liver, or kidneys, the effect is most disastrous. Hence it behoves everyone to keep his or her blood in a perfectly healthy condition. No matter what the symptoms may be, the real cause of a large proportion of all diseases is bad blood.

SKIN DISEASES, Eruptions, Blotches, Spots. Pimples, Pustules, Boils, Carbuncles, Ringworms, Sore Eyes, Erysipelas, Scurfs, Discolouration of the Skin, Humours and Diseases of the Blood and Skin, of whatever name or nature, are literally carried out of the system in a short time by the use of this world-famed medicine.

IMPORTANT ADVICE TO ALL.—Cleanse the vitiated blood whenever you find its impurities bursting through the skin in pimples, eruptions, and sores; cleanse it when you find it is obstructed and sluggish in the veins; cleanse it when it is foul—your feelings will tell you when. Keep your blood pure, and the health of the system will follow.

CAUTION.—Purchasers of Clarke's Blood Mixture should see that they get the genuine article. Worthless imitations and substitutes are sometimes palmed off by unprincipled vendors. The words "Lincoln and Midland Counties Drug Company, Lincoln, England," are engraved on the Government Stamp, and "Clarke's World-famed Blood Mixture," blown in the bottle, WITHOUT WHICH NONE ARE GENUINE.

"Marl Hill, Chalford, May 10, 1893.

"My wife had abscesses on the leg, caused in the first place by a blow which brought on the first abscess, after which they kept on coming until she had ten. She tried almost everything she could think or hear tell of, but without receiving any benefit, when a friend advised her to try Clarke's Blood Mixture, which she did, and after taking four 2s. 9d. bottles her leg got quite well, and it has never broken out since. My wife has very great faith in it, and is truly thankful that there is such a thing as Clarke's Blood Mixture.—I am, dear Sir, yours respectfully,

GEORGE STRATFORD.

"P.S.—It was my wife's wonderful cure that induced me to try it for myself."

Sold in bottles, 2s. 9d. each; and in cases containing six times the quantity, 11s.—sufficient to effect a permanent cure in the great majority of long-standing cases—by all CHEMISTS and PATENT MEDICINE VENDORS throughout the World; or sent to any address on receipt of 33 or 132 stamps by the Proprietors, THE LINCOLN AND MIDLAND COUNTIES DRUG CO., LINCOLN. Trade Mark—"BLOOD MIXTURE."

**THE LATE SIR ANDREW CLARK, M.D.**  
(SPECIAL MEMOIR.)

**T**HE death of Sir Andrew Clark, Bart., late on Monday afternoon, November 6th, was not unexpected. The eminent physician passed peacefully away shortly after half-past four o'clock in the presence of all his family, while prayers were being read by his son-in-law, the Rev. W. Lee. The medical gentlemen present were Dr. Liveing, Dr. Jackson, and Dr. Hadley. Sir Andrew rallied a little towards the end and appeared to recognise a few of those present, but he never rallied sufficiently to be able to say anything. The face of the deceased physician wore a most peaceful expression.

Sir Andrew Clark, Bart., the son of Andrew Clark, Esq., of St. Fergus and Aberdeen, was born on October the 28th in the year 1826. He commenced his professional studies at Aberdeen, and continued them at Edinburgh, where he secured for himself the medals of the Extra Academi- cal Medical School in the following numerous and general subjects:—Anatomy, Physiology, Chemistry, Botany, Materia Medica, Surgery, Pathology, and Practical Medicine, thus plainly indicating as a student the versatility of his professional brain.

Whereas some students distinguish themselves in one or, perhaps, two or more branches of their professional study, and gratification. He has also occupied the posts of Councillor and Examiner in Medicine to the Royal College of Physicians, and has for

THE LATE SIR ANDREW CLARK, M.D.

*Drawn from a Photograph by Barraud, 263, Oxford-street, London, W.C.*

Andrew Clark distinguished himself beyond his fellows, and carried off the prizes in almost all.

Having graduated in medicine at Marischal College, Aberdeen, in 1854, he quickly migrated to London, as so many Scotchmen have done before and since, to find a wider scope and larger field for the exercise of his professional ability. For two years previous to his settling in London he assisted Dr. Hughes Bennett in the Pathological Department of the Royal Infirmary, where he rendered himself popular by his skilful aid, and held the post of Demonstrator of Anatomy under Dr. Robert Knox during the first course of lectures delivered by him.

For four years Dr. Clark had charge of the Pathological Department of the Royal Naval Hospital at Haslar, delivering a series of interesting lectures.

It was not until 1854 he decided to remain in London, and entered the London Hospital as physician. In 1858 he gained the Fellowship of the Royal College of Physicians of London, and was afterwards elected by that body to the Croonian Lecturer-ship, which he filled to their satisfaction

**READ SPECIAL ARTICLES THIS WEEK.**

many years been leading physician to the London Hospital. On August 9th, 1883, he was created Baronet in appreciation of his excellent skill and valuable contributions to medical science.

At the very outset of his career, as the *Daily Telegraph* reminds us, Sir Andrew Clark encountered a difficulty that would have overwhelmed many a less energetic man. He was seized with hemorrhage of the lungs in so serious a form that his medical adviser warned him that it would be at the risk of his life to persist in his arduous medical studies; he must give up all thought of becoming a doctor, and think only of his own health. The aspirant for fame was not to be thus daunted. Happily, for the world, youth has a horizon of its own. Recognising fully the grave nature of the danger, young Andrew Clark determined, come what might, that a doctor he would be, and that he would begin, if possible, by curing himself. It was a sharp application of the precept: "Physician, heal thyself," and he made up his mind not to rely on medicine, but to subject himself to a strict regimen of fresh air, moderate exercise, and careful dietary. Persisting in this course with the decision of character which was one of his unflinching attributes, his unswerving faith in Nature was rewarded by a most gratifying result. The breakdown that had seemed inevitable was avoided, the lungs were healed, and Andrew Clarke's first serious patient was saved for a vigorous and energetic life. Telling the story himself he once said: "I determined, as far as my studies would allow me—for I never meant to give them up—to live in the fresh air. This resolution I carried out, often studying *al fresco*, and in a very short time I was so much improved that I was able to indulge in gentle physical exercise, taking care not to do too much; and so, in the course of time, I became well, if not robust—and I may almost say I got over the trouble that had threatened me." This experience had a decisive influence on Sir Andrew's future. It was one of those mishaps which make a man. In this way his attention was specially directed to pulmonary diseases, and there can be no doubt that his success in their treatment was largely due to the fact that he never ceased to insist on the first importance of the natural remedies from which he had himself benefitted. Consumption and ailments of the chest largely occupied his scientific attention.

Mr. Gladstone's physician, the *Daily News* remarks, will be missed on platforms like that from which the Prime Minister delivered his Newcastle Programme. Sir Andrew Clark sat watch in hand when the Newcastle speech was delivered. He had limited his patient to an hour. As the hour was up, Mr. Gladstone tossed aside the last sheet of his notes, and the physician looked triumphant. But in the warmth of his oratory Mr. Gladstone went on without his notes for nearly half an hour longer, during which time the physician's look of triumph changed to one of mingled perplexity and amusement. After the speech the applause of the crowded Newcastle Theatre was tumultuous, and was crowned with a touching rendering of "Auld Lang Syne" by thousands of voices in unison. Mr. Gladstone was on his way out of the hall, but he turned back to acknowledge this moving farewell. There were many swelling hearts at that moment, for the scene was overpowering to the emotions, and those who were near Mr. Gladstone were not surprised to note that he was moved to tears. They looked at Sir Andrew Clark. "Nerer mind," said Sir Andrew, "it will do him good." He had felt Mr. Gladstone's pulse, and was able to say that the veteran statesman was in even better form at the end of his speech than he had been at the beginning.

Of late years, Sir Andrew Clark's time, says the *Times*, has been filled up, from morning to night, by the unceasing demands of patients, to which both the calls of friendship and the ties of family have to some extent been sacrificed.

His principal recreation has been reading, in which he could indulge when in his carriage or on a railway journey; and even from his youth he has found his chief pleasure in books dealing with the great problems of theology and philosophy, to which he has given whatever attention could be diverted from his daily tasks. There is but too much reason to fear that his almost ceaseless activity of body and mind has been the chief cause of his fatal illness, and that he has, in the strictest sense of the words, been worn out by overwork. His holidays were few, brief, and liable to interruption by claims upon him which he did not think it right to disregard. Although always early in his consulting room, he was often engaged until late in the night by an enormous correspondence; not only all written with his own hand, but every word of which was weighed with scrupulous care. Much of this was forced upon him by the thoughtlessness and want of consideration of patients, but he would not on that account delegate what he considered his responsibility to a secretary. In all professional relations, whether to his patients or to his medical brethren, Sir Andrew Clark's life has been an example of devotion to the highest sense of duty.

## RECOLLECTIONS OF SIR ANDREW CLARK, M.D.

[From the *Westminster Gazette*.]

THOSE who knew Sir Andrew best, and had known him longest, would often smile—very affectionately and, to the outsider, somewhat mysteriously—when the conversation turned to the eminent physician. "It is a wonder," a medical man and a friend and admirer of Sir Andrew's said to me a short time ago, "it is a wonder Clark has not been utterly spoiled years and years ago. His patients, and particularly his lady-patients, do their very best to bring about such a result. They worship him, every one of them; and, what is more, his very presence seems to cure half of them. Nor is this surprising. There is something so genial, so sparkling, so sympathetic about the man, which fascinates you in spite of yourself, and in spite of his Scotch bluntness. This is one of the reasons of Sir Andrew Clark's success. Another, and a far greater one, was his wonderful knowledge of human nature, and his perfect mastery of the fact that in nine cases out of ten the patients who apply to a fashionable physician suffer chiefly from ennui, indolence, and the consequences thereof. They would be ill, they must be treated by Sir Andrew and by no one else; it gave them importance, and it belongs to fashionable life. Clark has little patience with these *malades imaginaires*, but his is so kindly, and perhaps also so courtly, a disposition, that his very wrath has an air of geniality, and acts like a tonic. He prescribes, for such cases, exercise and a plain diet rather than medicine, and the result is that his fame spreads more widely every year, though he himself is the last man in the world thus to seek honours.

"No, his real fame is the result of nothing but hard, continual work. Few men have worked so hard and so steadily as Sir Andrew Clark. And whenever he has a really serious case in hand, he gives it his whole and almost passionate attention, and it is not too much to say that he wrestles for his patients with grim death itself."

Shortly afterwards (writes the journalist to whom the remarks just given were made) I met Sir Andrew personally. Lord Tennyson was dead; from Haslemere came confused rumours that the death-bed scene had been of unearthly beauty, and that Sir Andrew, who had watched with his dying friend and patient through the whole of the last day and night, was on his way back to London. When I stepped out of my hansom, at his door, Sir Andrew drove up from the opposite direction. He could not see patients just then, the servant told me very politely. I wasn't a patient, I replied, and gave him my letter of introduction from the editor. And then I was told Sir Andrew would see me presently. I had to wait some time, and then

he himself came in full of apologies, and ready to listen to my requests. "Come along into my den," he said, very kindly; "I am tired, but I would like to oblige your editor. Your editor is my editor, for yours is the only evening paper I read regularly."

"And now listen and I will tell you what I think I may say," he said, as we had settled in the famous consulting room. A reddish light from the fire lit up the gloom of the dull, wet autumn day, and in the perfect silence of the house Sir Andrew's account of that most wonderful of death-beds, was almost as a story from another world. He looked very sad as he was sitting in front of his bureau, incessantly twisting a pencil between his fingers; but for one moment he brightened up, then looked frowningly at me, and said, "Do you know what you are asking? You are asking me to do what in the medical profession is considered an awful breach of etiquette." And then he got up, and in bitter disappointment, I rose to go, with only sufficient courage left to say that certainly if this was so I was sincerely sorry. In one second the frown turned into a genial smile, and, with his hand on my shoulder, he said, "Sit still. I don't mind committing a breach of etiquette this time, but you must promise me faithfully not to mention my name as that of your informant."

"Keep my name out, and then tell the world what I tell you, as far as words can tell such things, of that glorious death-bed down on the Surrey hills," and then, with glowing emotion, with a voice that rose and fell, and often grew husky and unsteady, he told me of the last watch by the bedside of the poet. "I have stood by the bed-sides of thousands of fellow-creatures," he said, "and have seen very grand and solemn death-bed scenes, but never, never one like that from which I have just come home." Sir Andrew, when he grew animated, had a strange magnetic power over his hearers—I have heard others, students, medical men, and private friends of his often observe this—and I sat in spell-bound silence as he told of the glorious day which, in the midst of the autumn storms and rain, dawned over the world as the poet lay on his death-bed. One sentence I remember of the description which he then gave me. "The distant hills, shrouded in mists of perfect white, could be seen through the oriel window of the room where Tennyson lay like a piece of breathing marble." He went on to describe the night flooded with moonlight, the perfect stillness, the dying man's request for his Shakespeare, and "after that the dark," and then he rose again, and walked up and down the room. I also rose to go.

"Sit still?" he thundered suddenly. "Shall I tell you why Tennyson's death was so peaceful? This is not to be put into the papers to-day; probably it would not interest them to-day. But the secret is this: He lived a quiet, laborious, simple life. It is a secret which few men learn in time to profit by it. I was his friend before I was his physician. Metaphysics drew us together. Gladstone, too, is deeply interested in that subject, and we all three agreed in our taste for a simple life and a life of work. "Half the disease of this generation is due to people's idleness. Idleness, the beginning of all evil. The mother of a pampered darling of a daughter sends to me. The girls ails, no one knows why. I am to come and prescribe. I know before I go what is the matter with the girl. 'Go to your local medical man,' I say; 'he can manage the case very well.' But no, it must be Sir Andrew, the grumpy Scot, and Sir Andrew prescribes long walks and less rich food, and regular meals and early hours. And presently, when the young lady has regained her red cheeks and high spirits, they think I have performed a wonderful cure!"

"Now let me tell you how I myself have managed to live at all. I'm 66. Over thirty years ago, when I was a young and obscure Scotch practitioner in London, I applied for a place on the medical staff of the London Hospital. The authorities there said, 'Oh let us give the poor chap a chance. He is consumptive; he won't last long. Let us, in pity, give him the post.' Well, I have outlived nearly every one of them. All my life I have been delicate; I have several times been at death's door; but by reason of a simple life, and a life

"IF YOU CANNOT SLEEP" because you have a cough or tickling in your throat, use the unrivalled remedy, KEATING'S COUGH LOZENGES, one alone affords relief—well called "sweet relief"—in cases of cough, asthma, bronchitis. Sold everywhere in tins, 13d. each; free on receipt of stamps. Thos. Keating, (Chemist, London.—[ADVF.]

of work, I have managed to get very close to three score years and ten."

I got up once more to take my leave. "Sit still," he commanded once more, as he put on his glasses and a professional air. "And so you are one of those ladies who write? They tell me all the younger generation of women write and smoke. Do you smoke?" (with a terrible emphasis on the personal pronoun). "No, Sir Andrew, I don't." "You don't smoke? Look here, let me tell you one thing. *Don't! Don't!*" I took my leave, and jumped in to my hansom; but I was recalled. "Come back! make haste! young woman, come back this moment!" Sir Andrew called after me, and showed me again into his room. "I only want to tell you one thing. If you breathe my name, in connection with what I have told you I'll—I'll—I'll haunt you. Now shake hands and forgive a garrulous old man for keeping you so long."

I never mentioned Sir Andrew's name at the time in connection with the information. He sent his "Well done!" down to me when he saw my article, and that was the last I heard directly from him. But if the threat of haunting me for revealing who was our informant about Tennyson's deathbed scene was meant to be indefinite, then— But I do not think Sir Andrew went so far in his prohibition.

### EDITORIALS.

**THE DANGER OF LONG SKIRTS.**—A prominent physician, who gives close attention to bacteriological study, says:—"Late the long dress trains worn in the streets by our ladies suggest another way to carry tubercle and other bacilli into our houses. In walking along the streets we constantly see a dress wipe up portions of sputum from the pavements. From one of these dresses dragged over the streets a few times I was able to demonstrate the presence of seven tubercle bacilli on an inch microscopic slide on which a little dirt off a dress was dusted. Knowing, therefore, that these long dresses have dried tuberculous sputum on them for the maids to dust off in our ladies' dressing rooms, most of which are poorly ventilated, we can quite understand how a sufficient number of bacilli can be collected in small compartments to an extent dangerous to at least those predisposed to tuberculosis."

**FINGER nails grow most rapidly upon the healthy.**

An apple poultice is said to be so good a thing for sore eyes that it is used regularly in French hospitals, but any poultice is dangerous for a non-professional to apply to the eye.

Some women unwisely try to enhance the brilliancy of their eyes by exposing them to an air slightly impregnated with a powerful acid or rub over each eye a tiny quantity of belladonna ointment. This artificial dilation has again and again been the means of injuring the sight. Plenty of sleep and good digestion are the best cosmetics for the eye.

**SUICIDES IN EUROPEAN ARMIES.**—In view of the epidemic of suicides which seems to have set in of late it is interesting to see how different countries stand in this respect. The following figures give the number of suicides in the various armies of Europe per 100,000 men: Austria, 131; Germany, 67; Italy, 40; France, 29; Belgium, 24; England, 23; Russia, 20, and Spain, 14.

ONE way of toughening ourselves is by means of a cold foot bath. We take cold through the feet as often as any way; by putting them in cold water for about ten seconds, morning and night, and then rubbing them till they are red, is a grand remedy for all this. Ten or fifteen seconds are long enough, and even less will do in the first few times. It is unwise to prolong this bath, and may do harm.

**HEALTH HABITS OF SCHOPENHAUER.**—Schopenhauer, who evidently got a good deal of enjoyment out of his life in spite of his pessimism, writing in his old age, said, "I run like a greyhound, blow at my flute every day, and beyond my deafness have nothing to complain of on the score of health." Readers of his biography are aware that he lived with great regularity, never missing his morning bath, two hours constitutional, &c. His mind was active to the last, and he died suddenly without any painful illness. He never overworked himself, and thus brain and body remained healthy. He lived to be over eighty years.

**THE CAUSE OF BILIOUSNESS.**—The cause of biliousness is a dilated stomach. Food decomposes in the stomach, and that gives rise to the condition known as biliousness. It is a state of poisoning in the stomach, produced by the action of germs upon the food remaining there. When those germs grow up through the oesophagus they produce the bad coating on the tongue. Biliousness always means bad diet. If a man is bilious he ought to be ashamed of himself, for it means that he has abused his stomach. A dilated stomach is very common among chronic dyspeptics. It is a stretching of the stomach in consequence of overloading it; it is sometimes due to a breaking down of the stomach.

**WHO MAY HYPNOTISE?**—At a meeting of the British Medical Association lately held the subject of hypnotism was discussed and it was agreed that the force was a real one. This medical men have doubted for a century and many still doubt. Now, however, that this is admitted it is suggested that those who are not physicians shall not practice it. This is just like the doctors. If after endless trouble you succeed in convincing them of the value of some novelty in therapeutics, they turn on you at the first chance and proclaim that the thing is indeed a good thing, but that they are the only folks fit to be trusted with its application. The truth is that not all persons can hypnotise, and even few doctors are fit to do it. The best hypnotisers are strong persons with upright characters and good sense, and who are willing to learn what is best to do, and to do it, and to avoid what seems trivial and foolish. It will be a long time before there are many good operators either in or out of the profession.

**TO WASH THE HAIR.**—For washing the hair, particularly such as is inclined to be oily, nothing is better than the common hard soap of the kitchen. A woman who has used it frequently herself and seen its benefits tested in other cases prescribes it with strong faith. "Make a strong suds," she says, "rub it quickly on the hair and wash it off again at once. After that any scented scap or wash may be used in the way of an ordinary shampoo." A lady's maid, who is famed for the care of her mistress' hair, may be taken in further testimony of the same article, as the only wash she uses is soapsuds thickened with a teaspoonful of glycerine and the white of an egg. Undoubtedly women waste money in expensive hair beautifiers and preservers. Simple means are just as effective. The pulp of a lemon, for instance, rubbed on the roots of the hair will stop ordinary cases of falling out.

**MALE AND FEMALE BRAINS.**—A physician who has had much experience of the insane has examined the brains of one thousand six hundred subjects. He comes to the conclusion that Nature makes palpable differences between male and female brains. First, there is a difference in weight, the male being heavier, possibly by one ounce, relative to weight of body; second, while the frontal lobes are equal in the sexes, the parietal are larger in the male and the occipital in the female, who consequently, has quicker perceptions; third, the female brain is less convoluted in the grey matter and has less service; fourth, the blood supply is more copious in the anterior lobes in the male and the posterior has a larger supply in the female, and these parts have different activities. The blood of the female is also poorer in corpuscles, there being half a million less in a cubic millimeter. He fears that the tendency of too much education or intellectual development in women is to make them lose beauty. He instances the Zoro women of India. They are supreme. They woo the men, control the affairs of the home and nation, transmit property, and leave man nothing to do. The result is that they are the ugliest women on earth.

It is simply untrue, says the *Sanitary Record* that red-haired girls are never left to become old maids. We have the honour to be acquainted with at least one engaging spinster who is dowered with auburn, not to say caroty, locks; and we do not intend in this matter to listen to the sophistical argument that it is the exception that proves the rule. Those who maintain that maidens with red hair always attract the men, and therefore get married, explain the alleged fact by pointing out that the colour of their crinal ornament is due to a superabundance of iron in the blood, and that it is this mineral that imparts "the vigour, the elasticity, the great vitality, the overflowing thoroughly healthy animal life which runs through the veins of the ruddy-haired," and that renders them attractive to the other sex. The fact that many girls have been known to dye their hair so as to give it auburn tinge seems to show that they themselves incline to the belief that the richer golden colour will give them an advantage over those who do not resort to such methods. The theory is quite in accordance with Darwinian principles of natural selection, and George Meredith has popularised the general idea in his strange book called "The Egoist," where he shows that even aristocratic wooing is strictly determined by the scientific principle that "success is awarded to the bettermost."

**A GRAND SPECULATION,** in these days of financial unrest, is a rare thing for people with spare capital to come across. It is, therefore, refreshing to know that in purchasing a box of Holloway's Pills, good value for money can be obtained. They never fail to give instant relief from pain, and no disease can long withstand their purifying influence. A few appropriate doses at the proper period will prevent many a serious illness. Their primary action is upon the blood, stomach, liver, kidneys, and bowels. Their secondary action strengthens the nervous centres. No drug can be so harmless yet so antagonistic to disorders caused by brain worry. The most perfect reliance may be placed upon their regulating and renovating virtues. [ADVT.]

"The FAMILY DOCTOR. The contents are varied and useful, with an entire absence of Quackery."—*Observer*.

## THE STRUGGLE FOR EXISTENCE.

NO part of the Darwinian doctrine has taken stronger hold or made a more profound impression upon modern thought than the ideas involved in the phrase, "The struggle for existence." Obvious as the leading facts seem to be as revealed by the light of modern research, it is certain that we owe to the labours of Darwin, Wallace, and their numerous disciples the first distinct recognition of the broad biological law that all living organisms are engaged in a struggle to maintain their own existence and to propagate their kind. The means of subsistence being limited, a struggle ensues for their possession, and the results of this struggle we term "the survival of the fittest." By "fittest" we mean "best adapted to its environment." The term is thus a relative one and has no constant signification. Regarded purely from the biological point of view, fitness means such conditions of structure or function as enable the organism to react to its physical environment, to appropriate suitable nutriment from the elements of food available, and to protect itself against the dangers that menace its existence. So much is clear.

It is when we get into the ethical region that difficulties assail us, and it is to this side of the question that we desire briefly to advert. If the struggle for existence be world-wide, if it be waged on purely selfish principles, if the conditions of success be mainly strength and cunning, we are face to face with a conception of the creation from which we may well shrink appalled. Where, we may ask, is there place in such a scheme for justice, for mercy, for sympathy, for love? Happily these principles exist and their range is not wholly confined to the human family. We must pause, therefore, before we accept as complete or conclusive such a conception of biological laws as would seem to exclude any recognition of the higher moral qualities. The very fact that these qualities have arisen and now exist is proof that there is a place for them in the universal plan. Any analysis of these qualities into mere phases of selfishness is as unsatisfactory from the point of view of philosophy as it is repugnant to the unsophisticated feelings of the human heart. These reflections have occurred to us on reading Sir J. Crichton-Browne's address on "Biology and Ethics" at Sheffield, with the general drift of which we find ourselves in much sympathy. "In the case of civilised man," he says, "natural selection is subject to numerous and extensive limitations. The struggle for existence still goes on vehemently enough; but it is changed in character, and instead of animal rapine we have industrial competition. The brutal and relentless acts of self-assertion that in a savage state secured the survival of the fittest—that is to say, of those best adapted to savage surroundings—have been condemned as unsuitable to a more artificial existence, and are punished as crimes, and the conflict is carried on by cunning devices which abolish the weakest slowly and unobtrusively, and do not outrage certain moral feelings opposed to violence which have in the meantime grown up."

This is, no doubt, true, but our point is that, if a selfish struggle were a correct and complete analysis of the competition which undoubtedly exists among all living organisms, it is difficult to see how, for example, violence was ever deposed from its place of honour. It might be argued that, in the process of evolution from lower to higher types, it came to be perceived that violence often defeated its own ends, that cunning and foresight were the really important things, and that violence came to be condemned, not *quâ* violence, but simply as a misdirected force. That there is some truth in this view of the case is probable, but it is surely a very inadequate explanation of the honour which we pay to patience, self-control, self-surrender, and love. Again, Sir J. Crichton-Browne says

ONE box of Clarke's B41 pills is warranted to cure all discharges from the Urinary Organs, in either sex (acquired or constitutional), Gravel, and Pains in the Back. Guaranteed free from Mercury. Sold in Boxes 4s. 6d. each, by all Chemists and Patent Medicine Vendors throughout the World; or sent to any address for sixty stamps by the Makers, THE LINCOLN AND MIDLAND COUNTIES DRUG COMPANY, Lincoln [ADVT.]

truly that "in social progress the struggle for existence becomes in certain directions a surrender, not of the feeblest, but of the strongest and the best. A recognition of the obligations which man owes to his fellow-men, and the promptings of 'love's divine self-abnegation,' impose restraints on some of the competitors who, instead of forcing their way to the front, as they are well able to do, stand aside and allow themselves to be beaten by those less fitted to survive."

In other words, wherever the moral element appears the struggle for existence is no longer an unrelieved and relentless struggle, but is modified to an incalculable extent by other forces than strength and cunning. The lecturer went on to point out that, "the moment we get beyond the solitary animal, fighting for its own life, mutual obligation or a consensus becomes apparent." The social feelings exist more or less throughout the animal kingdom, and they reach a high degree of perfection even in the case of such creatures as ants and bees. It is evident that these feelings represent a higher phase than the unrelieved individualism which is the first and most obvious expression of the struggle for existence. The benefit of the individual becomes subordinated to the benefit of the community of which he forms a unit. This is a distinct advance, but if progress stopped here we should only substitute class feeling for individual selfishness, and the gain though real, would be very limited. We need to rise to the conception that man owes obligations, not only to his family, his class, his nation, but to the whole human race. The subject of the ethical bearings of the struggle for existence is, however, too vast to be pursued further here.—*The Lancet*.

## ARE NURSES AFRAID OF FEVER?
